Love, . . .	528
Marguerite, . . .	752
May Queen, the, . . .	304
Morning, . . .	496
Mother's Garden, a, . . .	368
Nameless, . . .	256
Philiphaugh Woods, in, . . .	816
Seaside Reverie, a, . . .	320
Shade and Shine, . . .	544
Snowdrop, to a, . . .	192
Sometimes, . . .	624
Spring: a Ditty for St Valentine's Day, . . .	144
Spring Chanson, a, . . .	128
Spring's Herald, . . .	160
Summer's Later Flowers, . . .	656
Swallow's Departure, . . .	688
Swallow's Return, the, . . .	384
Tennyson, . . .	768
Touch of Pain, the, . . .	576
Twilight, . . .	432
Vanished Dreams, . . .	80
Waiting, . . .	272
Westward, . . .	672
When Roses blow, . . .	448
Why? . . .	48
World and the Poet, the, . . .	96

Popular Science.

Autumn Days, in, . . .	720
Autumn Melody, an, . . .	608
Ballade of Roses and Thorns, . . .	480
Broken, . . .	224

Æsthetic Birds, . . .	447
Cairngorm in Winter, . . .	278
Chionodoxa Lucillæ, the, . . .	688
Colours of the Sea, the, . . .	534
Deep Mining at Manchester, . . .	423
Dreams and Perceptive Illusions, . . .	651

	Page
Earthquakes, concerning, . . .	49
Fluorine, . . .	71
Gambier, . . .	560
Glow-worm, the, . . .	543
Great Andes, on the, . . .	343
Green: its Symbolism, . . .	367
Grouse Disease, . . .	369
Highest Railway in the World, the, . . .	129
Insect Wax, . . .	661
Instinct, . . .	86
Lighthouse Illuminants, . . .	563
Lightning Figures, on, . . .	847
Loco, about, . . .	815
Modern Wonder-worker, Electricity, the, . . .	177
Mountain Observatories, . . .	246
Nickel and Nickel-steel, . . .	32
Ostriches at the Zoo, the. By Frank E. Beddard, M.A., . . .	273
Oxygen as a Commercial Product, . . .	268
Petroleum, the Origin of, . . .	593
Sense of Hearing in Animals, the, . . .	822
Sense of Smell in Animals, the, . . .	740
Singular Freaks of Lightning, . . .	463
Sticklebacks, about, . . .	348
Touch and Taste in Animals, . . .	583
Wire and Wire Products, . . .	511

THE MONTH: SCIENCE AND ARTS—

Advertising on the Clouds, . . .	285
Aerial Navigation, . . .	492
Agricultural Produce, . . .	766
Aluminium, new Uses for, . . .	765
Ancient Buildings, Protection of, . . .	558
Antarctic Expedition, . . .	76
Anthracite Coal in London, . . .	205
Ants, Ravages of, . . .	559
Ants and Fruits, . . .	702
Archæological Discovery, reported, . . .	286
Armour-plate Harveyised, . . .	844
Art Metal-work, . . .	284
Australian Butter, Import of, . . .	845
Australian Expedition, . . .	76
Bahama Fibre, . . .	206
Balloon, a Life-buoy, . . .	703
Balloon Parachute, . . .	619
Balloons, Military, . . .	765
Band-saw Machine, a large, . . .	286
Baths of Laurvik, Norway, . . .	352
Bank-note, a proposed, . . .	285
Biliary Calculus, a, . . .	284
Bird-killing, . . .	142
Birds and Trees, . . .	287
Blandyte, a substitute for Rubber, . . .	559
Bleaching Powder, Danger of, . . .	286
Blue Sharks near Cornwall, . . .	702
Brickwork, Denudation of Lime in, . . .	141
British Association, . . .	618
Bullets fired through Cotton Cloth, . . .	703
Butter Adulteration, . . .	618
Cabs, Prizes for the best, . . .	78
Camels in German Africa, . . .	765
Canada Western Railway, . . .	845
Carrier Pigeons, Military, . . .	207
Caterpillars, Prevention of, . . .	558

THE MONTH—continued.

	Page
Celluloid slow to ignite,	284
Cheese, a Hindrance to Digestion,	558
Chicago Exhibition,	350
Chicago Exhibition, Electricity in,	412
Chimney, a Steel,	702
Cholera Germs,	704
Chrome-steel,	766
Cigar Ends re-manufactured,	765
Clock, Floral,	845
Clouds, Luminous,	766
Coal supplied through Pipes,	414
Columbus's Ship, the <i>Santa Maria</i> ,	493
Copper-mining in French Congo,	78
Course Indicators, Crescent,	204
Curling Hall in New York,	286
Customs Officers, new Rules for,	764
Dabchick and Wood-pigeons in London,	286
Dallastype Process,	414
Dentists' Qualifications,	351
Diamond-mining in South Africa,	285
Divining-rod, Pretensions of the,	620
Drowning, First aid in,	352
Dust Particles in Air,	706
Earthquakes, Building for,	78
Eggs of Wild-birds,	704
Egyptian Tools,	702
Electric Communication on Coasts,	765
Electric Communications between Lighthouse and Coast,	141
Electric Fire-engine,	350

Electric Heating and Welding,	414
Electric Light, Cost of,	846
Electric Light from Wind-power,	350
Electric Light in Stage Effects,	492
Electric Lighting and Birds,	702
Electric Lighting in London Streets,	140
Electrical Exhibition at Sydenham,	140
Electricity, Theft of,	414
Electricity and Seed-growth,	206
Electricity in Relation to Mining,	142
Ethel, Chloride of,	285
Ether-drinking in Ireland,	286
Etruscan Burying-place,	704
Excavations near Tunis,	493
Fascination, Animal,	702
Fisheries, Irish,	350
Flowers embedded in Ice,	701
Fog in London,	142
Gas Leakage,	77
Gas of high Power,	206
Genus, Artificial,	619
Giraffes, Scarcity of,	846
Gloucester Cathedral, coffin in,	351
Gun, the Biggest,	702
Gun-cotton, Safety of,	492
Hathaway's Cottage, Anne,	618
Heating of Ships and their Cargoes,	78
Heliograph, Ives's,	765
Holystoning a Ship's Deck,	618
Horse-breeding in France,	351
Horticulture, Practice in,	286
Humming-birds of Michigan,	845
Hydrophone, M'Evoy's,	845
Hypnotic Experiments, prohibiting,	285
Ice-making Machine, a Hand,	491
India-rubber, artificial,	491
Influenza due to a Bacillus,	206
Inventions, Cost of patenting,	702
Irish Village in Chicago Exhibition,	619
Irrigation at Jaffa,	352
Jupiter's Satellites,	701
Kimberley Exhibition,	285
Lamp for Photographers,	205
Lamps, Danger of Mineral Oil,	559
Lebel Rifle Bullet,	847
Life-belt, Reindeer hair,	77
Life-lines ashore, carrying,	491
Light, Deprivation of,	702
Lightning Conductors,	618
Lightning Flashes, Photographing,	140
Line for warming Frozen Soils,	413
Limpet, Adhesive Power of the,	284
Line-engraving on Steel,	413
Lion in Attack,	285
Liverpool, Water-supply of,	557
Locomotives taking up Coal,	491
Longevity, Cases of,	142
Lucifer Match, a new,	704
Lucifer-match Factory in Calcutta,	559
M'Kinlay Tariff, Effect of the,	141
Magazine Rifle,	493
Magic Lantern,	414

THE MONTH—continued.

	Page
Magnetism and Animal Life,	845
Mammoth, Discovery of a,	350
Marching, Effect of, on Soldiers,	493
Masrite, a new Mineral,	414
Mediterranean, Deep Soundings in the,	350
'Meing,' chewed by Laos,	764
Metallic Alloy, a new,	414
Metallic Tubing, Flexible,	204
Meteorite, False Story of a,	847
Meteorological Stations in Canada,	346
Methylated Spirits,	142
Mica from Idaho,	350
Microphone in Russian Prisons,	492
Milk, Sterilised,	142
Mineral Resources of Britain,	141
Minerals in Britain,	492
Miner's Pick, a new,	492
Mouse Plague,	207
Music on Animals, Effect of,	766
Musical Staff, a model,	143
Mussels, Poisoning by,	142
Nansen's Arctic Exploration,	846
Natural Gas in Pennsylvania,	77
Nelson's Ship, the <i>Victory</i> ,	493

Oil-engines, Boat-propulsion by,	413
Olive Culture in Australia,	77
Onyx in Arizona,	493
Oxygen from the Atmosphere, separating,	206
Paintings by Van der Veld,	413
Paper-making in Corea,	492
Pastile for sustaining strength,	557
Pearl-fishery, Californian,	618
Penny-in-the-Slot Machine,	141
Penny-slot Lamps,	618
Pernambulator, a Safety,	558
Petroleum as Fuel,	413
Petroleum in Suez Canal, trans- porting,	413
Photograph cannot be purchased,	559
Photo-corrector, Van der Weyde's,	764
Photographic Convention,	557
Photographing the Heavens,	619
Photographs of Bullets in Flight,	412
Photography in Colours,	412
Platinum in the Urals,	765
Potato-culture at Nantes,	493
Potatoes, Preserving,	493
Quicklime from Oysters,	351
Rabbit-pest in New South Wales,	703
Rabbits, Pasteur's Virus for,	703
Railway Brake, a new,	77
Railway Carriages, Signs on,	413
Railway Gauge, Standard of the,	140
Railway Incline, a Steep,	766
Railway Speed, the fastest,	206
Railway-ticket Selling Machine,	845
Rain, Electrical,	620
Rainfall Observations,	351
Rain-makers in Australia,	846
Rain-making Experiments,	703
Reindeer in Alaska,	491
Rivers of Iuk,	847
Rochester, Anglo-Saxon Graves in,	704
Rocket Apparatus, Disadvantages of,	78
Rome, Electric Lighting in,	560
Rust, Calcium a Cure for,	703
Saccharin,	766
Salmon-fisheries of Great Britain,	141
Salt-manufacture in Argentina,	205
Schischophone, the,	846
Seythian Tomb,	704
Seals in Gulf of St Lawrence,	285
Search-light,	351
Sea-routes on the Atlantic,	79
Sea-water, Gold in,	286
Sea-water and the French Revenue,	620
Shale-oil Industry,	703
Shells from Guns, Discharging,	559
Ships' Bottoms, Coating,	703
Signalling on Railways in Thick Weather,	559
Smokeless Powder Company,	557
Snake-poison, antidotes for,	412
Snow in our Streets,	141
Snow-sweeper, Railway,	845
Soda-making, new Process of,	764
Speaking-tube, Homacoustic,	351
Spiral Springs, Tempering,	352
Sponge-trade of Smyrna,	619
St Gervais, Disaster at,	620
St Paul's Cathedral, Clock for,	142
Steam-launch, a fast,	846

THE MONTH—continued.

	Page
Still and the Licensing Duty,	765
Submarine Volcano,	77, 78
Sunflower in Russia,	287
Sunshine Recorder,	205
Tea-culture in New South Wales,	142

By WALTER BESANT.

PROLOGUE.

WHO IS EDMUND GRAY?

MR EDWARD DERING, in a rare interval of work, occupied himself with looking into his bank book. Those humble persons whom the City, estimating the moral and spiritual worth of a man by his income, calls 'small,' frequently and anxiously examine their bank books, add up the columns, and check the entries. Mr Dering, who was not a small man, but a big man, or rather, from the City point of view, a biggish man, very seldom looked at his bank book; first because, like other solicitors in large practice, he had clerks and accountants to do that kind of work for him: next because, like many solicitors, while he managed the affairs of other people with unceasing watchfulness, he was apt to neglect his own affairs. Happily, when one has an income of some thousands, private affairs from time to time force themselves upon their owner in the most agreeable manner possible. They obtrude themselves upon him. They insist upon being noticed. They compel him to look after them respectfully: to remove them from the dullness of the bank, and to make them comfortable in investments.

Mr Dering opened the book, therefore, having for the moment nothing else to do, looked at the balance, was satisfied with its appearance, and began working backwards, that is to say, upwards, to read the entries. Presently, he came to one at which he stopped, holding his forefinger on the name.

It was on the right-hand side, the side which to small men is so terrifying, because it always does its best to annihilate the cash balance, and

seems bent upon transforming addition into multiplication, so amazing are the results. The name which Mr Dering read was Edmund Gray. The amount placed in the same line opposite to that name was £720. Therefore, he had drawn a cheque to the order of Edmund Gray for the sum of £720.

Now, a man may be in very great practice indeed; but if, like Mr Dering, he knows the details of every case that is brought into the House, he would certainly remember drawing a cheque for £720, and the reason why it was drawn, and the person for whom it was drawn, especially if the cheque was only three weeks old. Seven hundred and twenty pounds! It is a sum in return for which many and very substantial services must be rendered.

'Edmund Gray!' he murmured. 'Strange! I cannot remember the name of Edmund Gray. Who is Edmund Gray? Why did I give him £720?'

The strange fact that he should forget so large a sum amused him at first. Beside him lay a book which was his private Diary. He opened it and looked back for three months. He could find no mention anywhere of Edmund Gray. To repeat: he knew all the details of every case that came into the House: he signed all the cheques: his memory was as tenacious and as searching as the east wind in April; yet this matter of Edmund Gray and his cheque for £720 he could not recall to his mind by any effort.

There is a certain stage in brain fatigue when

* Copyright 1892 in the United States of America by Harper & Brothers.

one cannot remember names: it is the sure and certain symptom of overwork: the wise man recognises the symptom as a merciful warning and obeys it. Mr Dering knew this symptom. 'I must take a holiday,' he said. 'At sixty-seven, one cannot afford to neglect the least loss of memory. Edmund Gray! To forget Edmund Gray—and £720! I must run down to the sea-side for a fortnight's rest.'

He shut up the bank book and tried to go back to his work. But this name came back to him. 'Edmund Gray,' he murmured—'Edmund Gray. Who on earth is this Edmund Gray? Why did he get a cheque for £720?'

The thing ceased to amuse him: it began to irritate him: in two minutes it began to torture him: he leaned back in his chair: he drummed with his fingers on the table: he took up the book and looked at the entry again. He got up and walked about the room—a long lean figure in a tight frock-coat. To walk about the room and to swing your arms often stimulates the memory. In this case, however, no good effect followed. The *nommé* Edmund Gray remained a name and nothing more—the shadow of a name. Mr Dering rapped the table with his paper knife, as if to conjure up that shadow. Futile Superstition! No shadow appeared. But how could the shadow of a name—an unknown name—carry off 720 golden sovereigns?

'I feel as if I am going mad,' he murmured. 'Seven hundred and twenty pounds paid by myself in a single lump, only three weeks ago, and I remember nothing about it! I have no client named Edmund Gray. The money must therefore have been paid by me for some client to this unknown person. Yet it was paid by my cheque, and I don't remember it. Strange! I never forgot such a thing before.'

There was an office bell on the table. He touched it. A clerk—an elderly clerk—an ancient clerk—obeyed the call. He was the clerk who sat in the room outside Mr Dering's office: the clerk who wrote the cheques for the chief to sign, brought back the letters when they had been copied, directed the letters for the post, received visitors, and passed in cards: in fact, the private secretary, stage-manager—we all want a stage-manager in every profession—or confidential clerk. As befits a man of responsibility, he was dressed all in black, his office coat being as shiny as a mirror on the arms and on the shoulders: by long habit it hung in certain folds or curves which never unbent: his face was quite shaven and shorn: all that was left of his white hair was cut short: his eyes were keen and even foxy: his lips were thin: his general expression was one of watchfulness: when he watched his master it was with the attention of a servant: when he watched anybody else it was as one who watches a rogue, and would outwit him, if he could, at his own roguery. In certain commercial walks of the lower kind, where honour and morality consist in the success of attempts to cheat each other, this kind of expression is not uncommon. Whether his expression was good or bad, he was an excellent clerk: he was always at his post at nine in the morning: he never left the office before seven, and, because Mr Dering was a whale for work, he sometimes stayed without a grumble until eight or even

nine. Man and boy, Checkley had been in the office of Dering & Son for fifty-five years, entering as an errand-boy at twelve.

'Checkley,' said his master. 'Look at this bank book. Credit side. Fourth entry. Have you got it?'

'Edmund Gray, £720,' the clerk read.

'Yes. What is that cheque for? Who is Edmund Gray?'

The clerk looked surprised. 'I don't know,' he said.

'Why did I pay that money?'

The clerk shook his head.

'Did you look at the book when you laid it on the table?'

The clerk nodded.

'Well—what did you think of it?'

'I didn't think of it at all. It wasn't one of the cheques you told me to draw about that time ago. If I had thought, I should have supposed it was your private business.'

'I was not aware, Checkley, that I have any private affairs that you do not know.'

'Well—but you might have.'

'True. I might have. Just so. As I haven't—who, I ask you again—who is this Edmund Gray?'

'I don't know.'

'Have you ever heard of any Edmund Gray?'

'Never to my knowledge.'

'This is the first time you have heard that name?' The lawyer persisted.

'The very first time.'

'Consider. Is there any Edmund Gray in connection with any of my clients?'

'Not to my knowledge.'

'Not to your knowledge. Has any Edmund Gray ever been employed about the office?'

'No—certainly not.'

'We have recently been painted and papered and whitewashed and new carpeted at great expense and inconvenience. Did Edmund Gray conduct any of those operations?'

'No.'

'Has the name of Edmund Gray ever been mentioned in any letters that have come here?'

It was notorious in the office that Checkley read all the letters that came, and that he never forgot the contents of any. If you named any letter he would at once tell you what was written in it even if it were twenty years old.

'I have never even heard the name of Edmund Gray in any letter or in any connection whatever,' the clerk replied firmly.

'I put all these questions, Checkley, because I was pretty certain myself from the beginning; but I wanted to make myself quite certain. I thought it might be a trick of failing memory. Now, look at the name carefully'—the clerk screwed up his eyes tightly in order to get a good grip of the name. 'You see I have given him a cheque for £720, only three weeks ago. I am not the kind of man to give away £720 for nothing. Yet I have actually forgotten the whole business.'

Certainly he did not look the kind of man to forget such a simple thing as the giving away of £720. Quite the contrary. His grave face, his iron-gray hair, his firm lips, his keen steady eyes, apart from the methodical regularity with which his papers were arranged before him, all proclaimed that he was very far from being

that kind of man. Very much the reverse, indeed.

'You don't mean to say, sir,' Checkley began, with a change in his face from watchfulness to terror—'you can't mean'—

'I mean this, Checkley. I know of no Edmund Gray; and unless the bank has made a mistake, there has been committed—a—what do they call it in the law-courts?'

The clerk held the bank book in his hand, staring at his master with open eyes. 'What?' he repeated. 'What do they call it? Good Lord! They call it forgery—and for £720! And on you, of all people in the world! And in this office! In our office!—our office! What a dreadful thing, to be sure! Oh, what a dreadful thing to happen! In our office—here!' The clerk seemed unable to express his astonishment.

'First of all, get me the returned cheques.'

The cheques always came back in the pocket of the bank book. Checkley was accustomed to take them out and to file them in their proper place.

Again, Mr Dering neither drew his cheques nor wrote his letters with his own hand. He only signed them. One clerk wrote the letters; another drew the cheques by his instruction and dictation.

Checkley went back to his own room and returned with a bundle of returned drafts. He then looked in the safe—a great fireproof safe—that stood open in one corner of the room, and took out the current cheque book.

'Here it is,' he said. 'Check drawn by you yourself in your own handwriting, and properly signed, payable to order—not crossed—and duly endorsed.—Now you understand why I know nothing about it. Edmund Gray, Esquire, or order. Seven hundred and twenty pounds. Signed Dering & Son. Your own handwriting and your own signature.'

'Let me look.' Mr Dering took the paper and examined it. His eyes hardened as he looked. 'You call this my handwriting, Checkley!'

'I—I—I did think it was,' the clerk stammered. 'Let me look again. And I think so still,' he added more firmly.

'Then you're a Fool. Look again. When did I ever sign like that?'

Mr Dering's handwriting was one of those which are impossible to be read by any except his own clerks, and then only when they know what to expect. Thus, when he drew up instructions in lawyer language, he expressed the important words by an initial, a medial, or a final consonant, and made scratches for all the words between; his clerks, however, understood him very well. If he had written a love letter, or a farce, or a *ballade*, or a story, no one, either clerks or friends, or compositors would have understood anything but a word here and a word there. For his signature, however, that was different. It was the signature of the Firm: it was a signature a hundred and twenty years old: it was an eighteenth-century signature: bold, large, and clear, every letter fully formed: with dots and flourishes, the last letter concluding with a fantasia of penmanship belonging to a time when men knew how to write, belonging to the decorative time of penmanship.

'Two of the dots are out of place,' said Checkley,

'and the flourish isn't quite what it should be. But the cheque itself looks like your hand,' he added stoutly. 'I ought to have seen that there was something wrong about the signature, though it isn't much. I own to that. But the writing is like yours, and I would swear to it still.'

'It isn't my handwriting at all, then. Where is the counterfoil?'

Checkley turned over the counterfoils. 'What is the date?' he asked. 'March the 4th? I can't find it. Here are cheques for the 3d and for the 6th, but none at all for the 4th.'

'Let me look.' Strange! There was no counterfoil. And the numbers did not agree with that on the cheque.

'You haven't got another cheque book, have you?'

'No; I certainly have not.'

Mr Dering sat with the cheque in his hand, looking at it. Then he compared it with a blank cheque. 'Why,' he said, 'this cheque is drawn from an old book—two years old—one of the books before the bank amalgamated and changed its title and the form of the cheques—not much of a change, it is true—but—how could we be such fools, Checkley, as not to see the difference?'

'Then somebody or other must have got hold of an old cheque book. Shameful! To have cheque books lying about for every common rogue to go and steal!'

Mr Dering reflected. Then he looked up and said: 'Look again in the safe. In the left-hand compartment over the drawer, I think you will find an old cheque book. It belonged to a separate account—a Trust. That has been closed. The book should be there.—Ah! There it is.—I wonder now,' the lawyer went on, 'how I came to remember that book? It is more than two years since I last used it or even thought of it. Another trick of memory. We forget nothing, in fact, nothing at all. Give it to me. Strange, that I should remember so slight a thing. Now—here are the cheques, you see—colour the same—lettering the same—size the same—the only difference being the style and title of the Company. The fellow must have got hold of an old book left about, as you say, carelessly. Ah!' His colour changed. 'Here's the very counterfoil we wanted! Look! the number corresponds. The cheque was actually taken from this very book! a book in my own safe! in this very office! Checkley, what does this mean?'

Checkley took the book from his master with a trembling hand, and read feebly the writing of the counterfoil, 'March 4th 1883. Edmund Gray, £720.'

'Lord knows what it means,' he said. 'I never came across such a thing in my life before.'

'Most extraordinary! It is two years since I have given a thought to the existence of that book. Yet I remembered it the moment when it became useful.—Well, Checkley, what have you got to say? Can't you speak?'

'Nothing—nothing. Oh Lord, what should I have to say? If you didn't draw that cheque with your own hand'—

'I did not draw that cheque with my own hand.'

'Then—then it must have been drawn by somebody else's hand.'

'Exactly.'

'Perhaps you dictated it.'

'Don't be a fool, Checkley. Keep your wits together, though this is a new kind of case for you. Criminal law is not exactly in your line. Do you think I should dictate my own handwriting as well as my own words?'

'No. But I could swear—I could indeed—that it is your writing.'

'Let us have no more questions and answers. It is a forgery. It is a forgery. It is not a common forgery. It has been committed in my own office. Who can have done it? Let me think'—he placed the cheque and the old cheque book before him. 'This book has been in my safe for two years. I had forgotten its very existence. The safe is only used for my private papers. I open it every morning myself at ten o'clock. I shut it when I go up-stairs to lunch. I open it again when I return. I close it when I go away. I have not departed from this custom for thirty years. I could no more sit in this room with the safe shut—I could no more go away with the safe open—than I could walk the streets in my shirt sleeves. Therefore, not only has the forgery been committed by some one who has had access to my safe, by some one who has stolen the cheque in my very presence and before my eyes. This consideration should narrow the field.' He looked at the cheque again. 'It is dated March the 4th. The date may mean nothing. But it was presented on the 5th. Who came to my room on the 4th or the days preceding? Go and find out.'

Checkley retired and brought back his journal. 'You saw on the 4th'—He read the list of callers.

'That doesn't help,' said Mr Dering.

'On the 1st, 2d, 3d, and 4th you had Mr Arundel working with you here every day from ten till twelve.'

'Mr Arundel. Yes, I remember. Anybody else?'

'Nobody else.'

'You forget yourself, Checkley,' Mr Dering said. 'You were, as usual, in and out at different times.'

'Oh Lord! sir—I hope you don't think'—The old clerk stammered, turning pale.

'I think nothing. I want to find out. Go to the bank. See the manager. Let him tell you if he can find out by whom the cheque was cashed. If in notes—it must have been in notes—let those notes be instantly stopped. It is not crossed, so that we must not expect anything so simple as the Clearing House. Go at once and find out exactly what happened.'

This happened at about half-past ten. The bank was no more than five minutes' walk. Yet it was twelve o'clock when the clerk returned.

'Well, what have you found out?' asked the master.

'I have found out a great deal,' Checkley began eagerly. 'First, I saw the manager, and I saw the pay clerk. The cheque was handed in by a commissionaire. Everybody trusts a commissionaire. The pay clerk knows your signature, and thought it was all right. I showed the cheque to the manager. He knows your handwriting, and he says he would swear that the cheque was drawn by you yourself. So I am not such a fool as you think.'

'Go on.'

'The commissionaire told the pay clerk that he was ordered to take it all in ten-pound notes. He took them, put them in his pouch, and walked away. He was a one-armed man, and took a long time over the job, and didn't seem a bit in a hurry.'

'About the notes?'

'The manager will stop them at once. But he says that if the thing was done by an old hand, there must be confederates in it, and there will be trouble. However, the notes are stopped. That's done. Then I went on to the commissionaires' barracks in the Strand. The sergeant very soon found the man, and I had a talk with him. He was employed by an old gentleman, he says, staying at the Cecil Hotel, Strand. The old gentleman sent him to the bank with instructions to get the money in ten-pound notes; and very particular he was with him about not losing any of them on the way. He didn't seem a bit in a hurry either. Took the notes from the man and laid them in a pocket-book. It was in the coffee-room, and half-a-dozen other gentlemen were there at the same time. But this gentleman seemed alone.'

'Humph! A pretty cool business, upon my word! No hurry about it. Plenty of time. That was because they knew that the old cheque book would not be found and examined.'

'Why did they write the cheque on the counterfoil? Why did they put the cheque book back again—after they had taken it out?'

'I don't know. The workings of a forger's brain are not within the compass of my experiences. Go on, Checkley.'

'The commissionaire says that he is certain he would know the gentleman again.'

'Very good indeed, if we can only find the gentleman.'

'I then went on to the Cecil Hotel and saw the head waiter of the coffee-room. He remembered the commissionaire being sent for: he saw the bundle of bank-notes brought back from the bank, and he remembers the old gentleman very well. Says he should certainly know him again.'

'Did he describe him?'

'There didn't seem anything particular to describe. He was of average height, so to speak, dressed in gray trousers and a black frock-coat, and was gray-haired. Much as if I was to describe you.'

'Oh! The notes are stopped. Yet in three weeks there has been ample time to get them all changed. Every note may have been changed into gold in three weeks. An elderly gentleman: gray hair: average height: that tells us nothing. Checkley, the thing has been done by some one who had, or still has, access to my safe. Perhaps, in some way or other, keys have been procured. In that case'—He stepped over to the safe and opened a drawer. 'See, Checkley; this drawer is untouched: it is full of jewellery and things which belonged to my mother. Nothing touched. Here is a bag of spade guineas again—nothing taken. What do you say to that? If the forger had possessed keys, he would, first of all, clear out the things which he could turn into money without any difficulty and very little risk. Nothing taken except that cheque, and

the cheque book replaced. What do you say to that? Eh?'

'I don't know what to say. I'm struck stupid. I never heard of such a thing before.'

'Nor I. Why, it must have been done in this room, while the safe was open, while I was actually present. That is the only solution possible. Again, who has been in this room?'

'All the callers—I read their names to you—your clients.'

'They all sit in that chair. They never leave that chair so long as they are with me.' He indicated the chair which stood at the corner of the lawyer's great table at his left hand. Now the safe was in the far corner, on the other side of the room. 'They could not possibly—Checkley, the only two who could possibly have access to that safe in office hours are yourself and Mr Arundel.'

'Good heavens! sir—you can't believe—you can't actually think'—

'I believe nothing. I told you so before. I think nothing. I want the facts.'

JUTE IN TRANSIT.

It is now but a few years short of a century since the directors of the East India Company received the first consignment of jute sent to this country. The consignment was a small one—in fact it took the shape of a single bale. The manifest alludes to it as 'the jute of the natives,' a description clearly indicative of the specimen bale being regarded rather in the light of a vegetable curiosity than as a fibre of any commercial value to western civilisation. It is matter of wonderment that the East India Company were so slow in recognising the true value of the jute fibre. They were usually but too keenly alive to the adaptability of Indian native products to British markets. The policy which asserted—

Ours is the harvest, where the Indians mow;
We plough the deep, and reap where others sow,

would never have sanctioned the leaving unexploited such a source of wealth. But the brittleness of the fibre of 'the jute of the natives' was long held an insuperable barrier to its taking any important place among the woven fabrics of British industry. Yet sugar, rice, and pepper had been imported into this country enclosed in gunny bags, woven from jute, ever since commercial relations had been established with India and the East.

About the year 1830, however, the suitability of jute fibre for the manufacture of coarse carpet and bagging was effectually demonstrated, and since that date the jute-trade has increased by leaps and bounds, until it has attained its present enormous dimensions. As is well known, Dundee is at once the great jute-port and also the principal centre of the manufacture of those articles in which jute is the chief constituent. It can hardly claim, however, to be the pioneer of the British jute industry, as some years prior to 1833, the year which saw the inception of the Dundee industry, a factory for coarse carpets of jute was in working at Abingdon. The business done, however, could only have been very tri-

fling, as it was not until 1829 that the Customs authorities assigned a separate heading to jute on their list of imports. The total quantity, however, imported in that year only amounted to three hundred and sixty-four hundredweight! Since that date, jute cargoes have rapidly increased, until at the present time the sea-carriage of jute finds employment for a very considerable section of the vessels of our mercantile marine. While our trade in jute has been in the main marked by steady increase, there are two periods in its history which interfered, the one beneficially, the other adversely, with its rate of development. The Crimean War caused a diminution in the imports of flax into this country, and jute was requisitioned to supply some of the goods formerly manufactured from the coarser qualities of flax. The American civil war of 1861-63 deprived the British jute factories of one of their chief markets; for the exportation of cotton from the United States having practically ceased, there was consequently no demand for the coarse bagging which the Dundee mills had long supplied for enveloping the cotton bales. Even this check, however, severely as it was felt at the time, was not an unmixed evil, for it led to the employment of jute in new branches of textile industry.

In discussing the question of the transit of jute, it must be remembered that the sea-voyage forms but a part of the vicissitudes to which it is subjected while *en route* from its native fields to the British factories.

The jute-plant thrives best upon an alluvial soil and under a hot and moist climate. Such a condition of things is best obtained on the banks of rivers; and as these inland waterways afford a ready means of communication with the coast, the land contiguous to them is usually selected for the sowing of jute. The seed is sown from March to May, and the harvest is reaped from August to October, and is best secured when the plant is in flower, as the fibre becomes hard and brittle if the plant is allowed to seed. The reaping is accomplished with a sickle or bill-hook, and then follows a process very much resembling that of retting in the preparation of flax. The jute in some cases is carried at once to a ditch or other reservoir of water and allowed to soak, the soaking process taking on the average a fortnight to accomplish satisfactorily. The most successful jute raisers adopt the plan of stacking the jute before soaking, the fibre resulting from this more tedious method being, it is stated, of a far superior quality to that obtained by carrying the jute to the water as soon as it is cut. The fibre is easily detached from the stalk, and afterwards sun-dried. It is then packed and pressed, bought by the traders, and conveyed to the coast, where, if the pressing is not satisfactory, it is redone, each bale weighing on the average four hundred pounds. The cost of production is extremely low, and each acre will yield with ordinary care something like thirteen to fourteen hundredweight. The principal factor determining the acreage sown with jute each season would seem to be the price of the other native products that the same soil would produce during the preceding season. Thus, if a planter saw from the market price of rice that he was likely to realise a higher remuneration

from that crop than jute, a certain acreage would be withdrawn for rice cultivation.

It is gratifying to British industry to know that nine-tenths of the jute exported from India comes to British ports. The proportion of exported jute carried in British vessels is even in excess of this fraction, so that Great Britain and her mighty dependency practically enjoy the monopoly of the world's trade in jute and its products.

Among the vessels employed in the sea-carriage of jute are to be found the finest sailing-vessels afloat, and competition is keen among them as to the possession of the record for fast jute-carrying. The specific gravity of jute even when tightly compressed is not very high, and the consequence is a jute cargo renders a vessel, in nautical phraseology, 'lively.' It is nevertheless a popular cargo with seamen; and sailing-vessels employed in the jute-trade experience, by reason of the time they leave Calcutta for home, and home for India again, climatic conditions which are very favourable when compared with those obtaining in other trades. The year 1890 marked the largest importation of jute direct from India into Dundee. No fewer than seventy-seven vessels arrived from Calcutta and Chittagong. Their united tonnage amounted to 151,957, and they carried into the port of Tay 1,260,019 bales of jute. In 1889, eighty-one vessels arrived, but their tonnage was only 149,896 tons, and their importations of jute 1,205,730 bales. Thus there is an increase in favour of 1890 of 2061 tons and 54,289 bales. Of the seventy-seven vessels from India, thirty-six sailing-ships and twenty-two steamers were from Calcutta; and sixteen sailing-vessels and three steamers from Chittagong. The voyage from Calcutta to Dundee via the Cape of Good Hope is a lengthy one; yet the average passage of the fifty-two sailing-ships was but one hundred and twenty-five days! The smartest passage was made by the *Gowanburn*, which accomplished the run in ninety-seven days. The *Earl of Shaftesbury* and the *County of Selkirk* took two days more; while the longest passage of all extended to one hundred and ninety days. Of the steam jute-carriers the fastest voyage was made in thirty-four days. Statistics for the year 1891 will doubtless show a material increase in the tonnage of the vessels and the amount of their cargoes, the movement in favour of large sailing-vessels influencing the sea-carriage of jute as well as other trades.

Such large shipments as those we have alluded to above cannot be carried over sea without incurring risk of fire and other damage. The energetic action of the different sections of merchants interested in jute has, however, reduced these risks very much. Fires on jute-ships are not nearly so common as they were in the early stages of the trade's history. They may happen either at the port of loading, any point on the voyage, or at the discharging port. Occasionally an outbreak of fire on board a jute-ship may get the upper hand and burn the ship out; but such complete disasters are happily of very rare occurrence. A catastrophe of this type, however, overtook the *Dalswinton*, fifteen hundred and fifty-four tons, while homeward-bound from India in December 1889 with a cargo of jute. The master of the vessel feared that his ship was too light,

and accordingly he put into the harbour of Galle to 'stiffen' her by discharging some jute and taking on board some stone ballast. Smoke was discovered coming from some bales of jute; and although all the fire-extinguishing power of Galle was requisitioned to quench the flames, all efforts were ineffectual, and the cargo was totally consumed, nothing being left but the shell of the vessel. The district judge, who held an exhaustive inquiry into the cause of the disaster, and carefully sifted all the procurable evidence, expressed his verdict in the following terms: 'I have no doubt that the fire was caused by spontaneous combustion in a highly inflammable cargo.'

Many fires on jute-ships are traceable, no doubt, to accidental causes, carelessness, exposure of greasy waste, &c. But to prove the exact cause to which an outbreak of fire in a jute cargo is due is a very difficult matter indeed. That spontaneous combustion is a fire-producing agent in damp jute there is strong presumptive evidence to show; but exact knowledge as to the chemical conditions under which this combustion occurs is far from finality. Shipmasters who have long been engaged in the jute-trade believe it is responsible for most of the fires on jute-ships; and these are the persons possessed of most practical knowledge on the subject. Some little while back, a meeting was held at the International Shipmasters' Club, Calcutta, to discuss the questions of the stowage of jute and fires on jute-ships. The captains who took part in the discussion were experienced men, well acquainted with the details of the sea-transit of jute—most of them, in fact, commanded sailing-vessels which were lying at Calcutta awaiting jute cargoes. One of the conclusions which the meeting was unanimous in expressing was that cargoes shipped between the first of August and the first of November were more likely to show damage than jute shipped after that date. 'Cuttings' and 'rejections' were a more dangerous cargo than ordinary jute. Cuttings are the woody ends of the jute-plant; and rejections are the lowest class of fibre, which can only be used in the manufacture of the coarsest of jute products. As stated above, the jute harvest extends from August to October, so that jute shipped during the period deprecated by the shipmaster must be hurriedly harvested and ineffectually dried. The moisture must of necessity damage the bale, as in the close hold of a ship free evaporation cannot take place. Cuttings would naturally necessitate a more thorough drying than jute; and where due care is not exercised, damage and risk of fire are inevitable. The early shipments of jute, too, are often cut too early—in fact, the jute is 'green;' and with these cargoes heating is very likely to ensue. Jute of this nature has every facility afforded it, so to speak, of taking fire. In many cases it is carried from the harvest-field to the jute presses in uncovered boats or 'trucks,' is exposed to occasional heavy showers and a scorching sun. In this condition it is pressed, and the heat, to express the matter nautically, 'banked up' in it. The friction on shipboard, accelerated by bad stowage, may supply the extra heat necessary to produce an outbreak of fire.

Jute bales have been known to burst into

flames when discharged from a vessel's hold ; and it has been noticed that in such cases the fire surged along the bales, producing great heat, and passing from one bunch of looser fibres to another. Further, it has been repeatedly remarked that damp jute 'rolls and crumbles to a powder.' Of course jute in this state is extremely liable to take fire. A thorough circulation of air throughout the ship seems to be a consummation to be aimed at by all interested in the carriage of jute ; and practical men maintain that this is best effected by leaving a space between the top of the cargo and the lower edge of the beams. In order, however, that the damage to jute cargoes may be reduced to a minimum, the best method of stowage and ventilation must be settled upon, and that plan must be carried out by all vessels in the trade as far as their structural qualities will allow. Merchants are willing to do their share by offering a bonus to vessels carrying out their suggestions ; but it is not until hearty co-operation between the jute planter or his agents, the shipowner, the shipmaster, and the merchant is secured, that the dangers incident to the transit of jute will be reduced to a minimum.

We have briefly alluded to the demands of the United States for jute-packing. Attempts have been made over and over again to acclimatise the jute-plant to America ; but the native jute industry makes little headway, and the States is still mainly dependent upon Indian-grown jute. A more dangerous attempt has been made, however, than this to wrest a portion of the jute-trade from India. Early in the spring of 1881 there were exhibited in Dundee some samples of jute grown in Egypt. Those qualified to judge of the value of these specimens expressed the following verdict : 'Reports on quality are varied, but, considering it is a first attempt, it is on the whole satisfactory. It proves beyond a doubt that Egypt is capable of producing this material ; and for the trade of the district this is a matter of great importance, as having the fibre grown nearer at hand will enable our manufacturers to compete more successfully in all markets with the Indian mills.'

India's position as a jute-raising country is, however, unaltered, her soil, her climate, and the cheapness of her human labour, placing her beyond reach of any rival. The amount of gunny cloth and bags which the native mills produce is enormous. Ten million yards of cloth and one hundred million gunny bags are an astounding quantity ; yet the jute products of India are vastly in excess of this amount. Even the old gunny bags and the poorest quality of jute fibres are put to a useful purpose, and utilised in the manufacture of rough paper.

British industry and British capital have imprinted their mark upon the jute industries of India, many of the mills being practically British speculations ; and the improvements in the raising of jute, and the mechanisms used in its preparation and manufacture, are mainly due to the invigorating infusion of British enterprise and scientific knowledge. There is something very striking in the sharing of the jute-trade of the world between England and India. The old Sanskrit word for the plant *Corchorus capsularis* was 'jhot.' The ancient dwellers in the valley

of the Ganges used its tender shoots as a pot-herb ; they wove from its long fibres most textile fabrics of domestic use. They even established a foreign trade in gunny cloth and gunny bags. But the knowledge of the plant and its uses was for long unknown to the commerce of Western Europe. Now, the western branch of the great Indo-European family of nations uses jute or jhot as familiarly as did the Hindus of old. It has become with us a household word. The world grows smaller. The inhabitants of the brightest jewel in the British crown are brought into closer contact with their brethren in Britain ; and not the least factor in linking together the eastern and western families of the Aryan race is the humble plant the 'jute of the natives.'

SUNSTRUCK.*

A NOVELETTE.

By GEORGE MANVILLE FENN.

CHAPTER I.

Bang !

'Hullo ! had you that time, you blood-sucking wretch.'

'*Ping-ing-ing—um-um-um !*'

'Missed him, by George ! Oh dear ! how hot it is !'

Then silence in the black darkness of the officers' cabin of His Majesty King George III.'s sloop of war, *The Queen*, sailing slowly among the paradise-like islands of the West Indies.

Then, *ping-ing-ing* again, the shrill hum of a mosquito, followed by the tiny trumpets of two more of the virulent insects, one in a higher, the other in a lower pitch than the first heard.

'Hang 'em ! I believe a cloud of the little demons came on board this afternoon from that confounded mangrove swamp.—Jack !'

No answer.

'Jack !'

Still no reply.

'Jack ! Why don't you speak ?'

'I'll speak to some purpose directly,' said another voice. 'Why can't you let a man sleep ?'

'I'll let you sleep, if they'll let me sleep ; but I don't see any fun in tossing about here all night while you are snoring.'

'Well, what do you want ?'

'To talk.'

'And I want to sleep.—Good-night.'

'I say, don't be selfish, Jack. Is it near morning ?'

'No ; we haven't been down an hour.'

'I say, though, do you smell cooking ?'

'Eh ? No. Why ?'

'Because I feel as if I were being stewed.'

'Bother !—Good-night.'

'Pretty sort of a messmate you are. I wish to goodness the mosquitoes worried you as they do me.—I say, Jack.'

No answer.

'Lieutenant John Manton !'

'Lieutenant William Burns, the heat down here is terrific. I am utterly wearied out, and so

[* Copyright reserved in the United States of America.]

sleepy. I can hardly move; but if you say another word to me, I'll get up and douse you.'

'Will you? Do—do—there's a good fellow! Get one of the men to dip a fresh bucket of water for you. Oh, joyful news!'

Craunch!

A dull heavy shock which made the sloop quiver, and a long low grinding noise that had but one meaning in those seas, and made the two young officers leap from their cots and begin hurrying on a few clothes, as, over a buzz of excited cries, orders, and the noise of hurrying feet, came the roll of the drum, beating to quarters; while, when the young men reached the deck, it was to pass the drummer making the parchment throb just as he had leaped out from his hammock, and clothed now in the broad pipe-clayed sling, his drum, and nothing else.

Sea perfectly calm, the land invisible, and the ship motionless, the long gentle heavy swell over which she had been riding, now breaking gently against the larboard bows. Overhead, the great soft mellow stars burning; below and all around, apparently lying on the ocean, a slight mist.

In a very short time every man was in his place, the proper officers had descended to sound the well, the various crews stood by ready to man the boats, and pending orders, and the report which might mean life or death, the saving of a gallant ship or her sinking beneath their feet, the captain spoke hurriedly to his officers, who learned that the first lieutenant who was in charge had only left the deck to make his report, the lead had been cast to find no soundings, and the sloop was just forging slowly ahead in the lightest of breezes when she struck.

'Not your fault, Morrison,' said the captain quickly. 'There's no rock laid down in the chart anywhere here, and we must be miles from land.'

'I'm afraid not, sir. We've got into some swift current, and'—

'Hah!' exclaimed the captain, as the carpenter came up. 'Well?'

Every head was craned forward, every sense strained to catch the report, and a thrill of excitement ran along the deck as the man said in his hoarse, sawdusty voice: 'Well 'bout dry, sir. She's not making a drop.'

Against discipline, but a loud cheer more like a yell of delight rose from the excited crew; and as silence once more reigned, fresh orders were given, and all knew that they must wait for morning, men forming the biggest watch ever known upon that deck.

'Just as all seemed so calm and peaceful, Will,' said Lieutenant Manton, as the two young men stood trying to penetrate the mist which lay thickly off the starboard side.

'Yes: a queer life, ours,' said Burns. 'Think we are near the land?'

'Yes, I fancy so: much nearer than we supposed.'

'Think we shall save the ship?'

'Hah!' ejaculated Manton, 'I hope so; but we must be on sharp coral, and Morrison says we went on nearly at high-water. We shall see.'

Morning seemed as if it would never come; but when the sun rose at last, and began to dissipate the mist, they caught sight first of the top of a mountain—a gracefully curved and beauti-

fully wooded cone, cut off slopingly at the top; and by degrees, as the mist passed away from its sides, there, in a blue haze shot with green and gold, lay precipice, gully, and patch of wondrous verdure, all veined by silvery falls till there lay clear in the morning sun the brilliantly coloured shores of a lovely tropic island sparsely dotted with houses, and here and there one which seemed to be the centre of some plantation.

'Not a bad place to settle down in, Jack, if we lose the ship.'

'Hang it, man!' cried his brother-officer, flushing; 'don't talk so coolly of losing your ship. Any one would think you wished her to go to the bottom.'

'I don't, lad,' said the young man, gazing longingly at the lovely island so near at hand; 'but I shouldn't mind having a month ashore.'

CHAPTER II.

It was about the same hour that Renée Greville threw back her casement to admit the soft cool breeze from off the sea, and as the jalousies creaked there was the sharp rattle of a chain somewhere near, and a deep-toned bay, such as could only have come from a bloodhound's throat.

'Morning, Nep. Good dog, then,' cried Renée.

There was a short answering bark, the rattle of the chain again, and a canine silence as the girl gazed over the veranda on the wealth of tropic foliage and flower in the great garden which surrounded the house and whose blossoms were still drenched with the heavy night-dew.

As she stood there, her little white hands were busy putting the finishing touches to her long fair hair; while her bright gray eyes sparkled, and a pleasant look of animation came into her sweet English face as she listened to a sweetly musical voice in the plantation, a hundred yards away, singing a weirdly strange ditty, which was repeated softly, line by line, in chorus by a score or so of voices. So peculiar and catching was the melody that the girl's lips parted, and quite to herself she too sang the song, whose rather childish English words had been wedded to the wild strain that had in all probability been brought over in some slave-ship from the west coast of Africa.

'An' Juno lub her lubber when a moon shine clear,'

sang Renée, the air and words having been familiar to her ear since she was a tiny child, taken by her black nurse down among the slaves toiling in the cane-rows or in the coffee plantations.

Then, after a little busy manipulation of her fair hair:

'Josee, dear, do get up.'

She looked toward an inner door of her dainty room as she spoke; but there was no reply.

'Oh Josee, you tiresome girl, how can you lie sleeping on such a lovely morning! Josee, it's nearly breakfast-time. Papa won't like it if you are not down.'

'When a moon shine clear,'

she sang in her sweet young thrilling voice. 'Now for a flower for my hair, and one for dear old Dad.'

She went to the window again, and reached out to where a passion-flower trailed up over the broad veranda and climbed up the jalousies of her own room, spreading a profusion of its blossoms, all brilliant scarlet, with purple markings in the centre; and she was in the act of picking a partly opened bloom, when her lips parted, and she uttered a half-suppressed 'Oh!' and stood leaning out, gazing at where, on the glassy sea, over which faint wreaths of mist still floated, lay His Majesty's ship, motionless, with her sails now furled.

'Here, quick, Josee,' she cried. 'Come and see.'

Almost at the same moment there was a step in the wide passage beyond the door, and a bluff cheery voice shouted: 'Hi! girls! Wake up! Here's a man-o'-war close in. Renée, have you had the glass? I had it last in my room to watch the men. See the ship?'

'Yes; I've been looking at it,' said Renée, opening her door.

'Come and look again, then,' said the bluff-looking, deeply bronzed man, whose crisp fair hair was cut closely to his well-shaped head, in direct opposition to the fashion of the period with its perukes and queues. 'You don't see a king's ship every day, my girl, and it's a treat after all.—Come, Josephine.'

There was no answer, but a scuffling noise suggested that the bearer of the name was dressing hurriedly. Then the door closed behind Renée, who was standing directly after at a broad window with her father, who was using the glass.

'What have they come here for, I wonder?' he said, as he held it to his eye. 'Want water, and fresh vegetables, I suppose, and— Why, Renée, my girl,' he continued excitedly, 'they've run on the Gray Corals, and she's fast.'

'Run on the rocks, papa!—Not wrecked?'

'Not yet, my dear; but if they don't get her off before the first breeze rises, she'll never sail another knot.—Here, ahoy, there!' he roared, with his hands to his mouth. 'Negus—Priam—where are you all?'

A tall muscular negro came hurrying round from the garden and looked.

'Get three men and the gig directly.'

'St massah,' cried the black, and he went off at a trot.

'Going out to the ship, papa?' said the girl.

'Yes, child; to see whether I've forgotten all my old training.'

'I'll see to your breakfast,' cried Renée.

'No; I'm going now;' and kissing the girl hastily, he descended to the cool open hall, caught up a straw hat, and hurried out.

Ten minutes later, as Renée stood at the window, joined now by a very dark, creamy-complexioned girl, whose eyes and wavy hair told plainly of the blood intermingled in her veins, they could see the water flashing as the light gig in which Renée's father was seated sped over the glassy sea, propelled by the muscular arms of four stout black rowers, who pulled with a regular man-o'-war stroke.

'Oh Josee,' cried Renée, with the tears in her eyes; 'isn't it dreadful?'

'Dreadful?' said the dark girl dreamily.

'Yes: that beautiful ship fast on the rocks. Papa thinks it will be a wreck.'

'Well, they must build another,' said the girl, slowly and languidly.

'Josee!'

'What does it matter? No one is drowned, and it is something to think about. It is so dull and miserable here.'

'Why, Josee, dear,' cried Renée, throwing her arms about the girl's neck and kissing her. 'You are as bad now as you used to be when a child—always cross till you have had your breakfast.'

'I am not cross,' said the girl, knitting her dark brows; and a curiously stern look coming over her handsome face; 'only sick of it all.'

'Josee!'

'I am, I tell you—sick of it. You despise me; your father only tolerates me out of charity; I'm so contemptible that the very slaves look down upon me. I am not a white; I'm not even black. I wish I were dead—I wish I were'—

She stopped short as she saw the tears falling fast down Renée's cheeks, and in an instant the look of languid indifference and bitterness gave place to a wild excitement.

'Renée, Renée,' she sobbed, as she threw herself on her knees and embraced her, 'don't—don't cry, dear. You do—I know you do—love me; it is like killing me to see you cry. What a wretch—what an ungrateful wretch I am!'

'Hush, hush, Josee, darling,' whispered Renée, sinking down by her to embrace and kiss her fondly, their light and dark hair intermingling as the tears fell fast. 'There; I will not cry; but it does hurt me to hear you talk like that. And it is so unjust.'

'Yes: I suppose it is; but you cannot tell what I feel.'

'I know what you ought to feel,' said Renée, kissing the ripe full lips as the girl clung to her. 'You know papa said we were to be like sisters, and I have tried to be so dear, always.'

'Yes, always; but I cannot help it. I don't know how it is, but I am sick of everything.'

'In a home like this, dear!' said Renée, reproachfully.

'Yes, even in a home like this,' said the girl, with the sombre look once more clouding her handsome face. 'I am weary of the flowers; their scent sickens me. I hate the fruit; it all seems to cloy. I hate'—

'Don't say you hate us, Josee, dearest,' cried Renée, laying her peachy cheek against her companion's of soft olive.

'Hate you?' cried the girl with a passionate sob. 'Nothing could make me hate you.'

'Nothing?'

'Nothing, Renée, dear; I hate myself.'

'Oh Josee,' whispered Renée, 'how can you talk so?'

'Because I am half one of a despised race.'

'It is not true,' said Renée with spirit. 'You cannot even say that of your dead mother. Papa has often told me that she was a beautiful quadroon lady, whom his friend loved; while you'—

'I am one who envies the poor black women who are your father's slaves.'

'You do not, for you are my dearest sister, and you shall not speak like this. But, Josee,' cried Renée suddenly, 'why do you go and talk so much to old Aunt Miramis as you do?'

The girl started as if she had been stung,

but recovering herself, she cried with forced gaiety: 'Because she has always been kind to me, I suppose.'

'She has not, dear; she has always sneered at you, I know.'

'Oh, then, because they say she is a witch, I suppose. I want to know what is to come to pass, Renée. I want my future told.'

CHAPTER III.

The boat soon reached the side of the sloop, and, after a challenge, its owner was allowed to climb on deck, where he was met by Manton.

'You wish to see the captain?' said the latter, in answer to the visitor's demand. 'Better send a message, sir. He is hardly likely to attend to you now.'

'I want no attention, sir,' said the visitor authoritatively. 'I am an old sailor. I saw from my windows the condition your ship is in. Tell your commanding officer that Captain Greville, R.N., has come to offer his assistance to lighten the vessel. It is your only chance. Tell him he can have fifty or a hundred men.'

The young officer's manner changed, and he saluted the speaker, hurried off, and returned to ask their visitor to come on the quarter-deck, where Captain Lance was standing with the first lieutenant, superintending the change of position of the guns so as to careen the ship.

'Glad to see you, Captain Greville,' he said, holding out his hand. 'Very good of you to come and help; but I think we shall be off soon with the loss of a little false keel. There is no leak.'

'You are counting on the tide,' said Captain Greville sharply. 'It is a vain hope, sir. We only have a rise here of a couple of feet, and you must have taken the ground at high-water. There is a terrific current out yonder, and it brought you in.'

Captain Lance gave an impatient stamp.

'Nothing else for it, sir. I should lower every boat at once and land my guns and shot first.'

'And not wait to see what the next tide will do?'

'I have been here twenty years,' said Captain Greville, 'as a planter, and I know the weather at this time of year. The sea is like a lake now. In an hour it may be so that no boat can live. The rocks upon which you have run your ship are like knives. Take my word for it, there is not a moment to lose.'

'I do take your word for it, sir,' said Captain Lance. 'We will lighten her at once.'

'And I will get together four boats and about a hundred men to help.'

'But they are not used to handling heavy stores.'

'Well, sir,' said Captain Greville, smiling, 'we consider our sugar-casks and rum-punches pretty heavy articles to move. At anyrate they can relieve your lads of the rowing. I have hardly a man who cannot row like one of a long-boat's crew. I will go back at once, and I need hardly say that my house is at your disposal. I am only a planter now, but am rejoiced to serve under the old colours once more. For the present, good-day.'

'I say, Jack,' whispered Lieutenant Burns to

his friend, 'always our luck. His house at our disposal, and we must work like niggers here.'

'And with niggers there,' said Manton. 'Come, lad. We have got to save the ship.'

THE MYSTERIES OF THE MULASTHANUM.

NOTHING interests the ordinary human mind more than mystery. Only breathe the word 'mysterious,' and the attention is at once riveted, the curiosity awakened. The mystery which enshrouds the Hindu temple, with its jealously guarded shrine and secret rites, fascinates the traveller. He may stand at the open doors and peer into its murky, windowless depths, but he may not set foot across the threshold. Dire would be the consequences if he did, for the English Government protects the rights of its Hindu subjects. There is very little to be seen, after all, in that peep. The air is thick with the smoke of burning camphor and incense, to say nothing of the dust of ages. No cleansing broom ever touches wall or roof; no towel ever removes the layers of dust from cornice or carving. No light, except that which penetrates from the open door, illuminates the hall. The lamps only serve to dazzle the eye; their rays scarcely reach the black image in whose honour they burn. And there is a close unwholesome smell emanating from the mysterious chamber which is not inviting. Nothing is to be gathered of the secret doings within the walls of the Mulasthanum by that wondering gaze. The traveller turns to the idlers loafing about the courts of the temple.

'What is inside there?' he asks.

'The Swami,' answers the phlegmatic Hindu.

'What is done there?'

'Nothing. The Swami sleeps.'

That is all the information the most inquisitive of travellers will gather, question and ask as he may.

Yet, silent as the Asiatic is upon the ceremonies of his temple, he cannot keep his secret. Here and there disclosures are made through litigation and prosecutions. A fraudulent trustee, a claim to certain religious rights, a disorderly religious procession followed by riots and breaches of the peace, bring the temple affairs under the searching eye of the law; and the mysteries of the Mulasthanum are unfolded. They are not very intricate, nor are they creditable to the honour and morality of the temple adherents.

Before touching, however, on the rites and ceremonies, it will be as well to describe the building. The Hindu temple of any size or pretension is a complex institution. It is a group of buildings enclosed within one or more walls. It possesses certain privileges, granted by native rulers in days gone by, and still respected by the present Government. It enjoys what may almost be termed a royal revenue from houses, lands, and offerings; and it possesses hoards of treasure in jewels, gold and silver vessels, and coins. The property is in the hands of trustees, who are elected or who claim an hereditary right to the office. These have power over an enormous wealth. Honesty is not the strong characteristic of the Oriental. Under unscrupulous trustees,

valuable jewels have disappeared, or been replaced with glass. Pots of silver and gold coins have been refilled with copper. Rich lands have been let at a nominal rent to their relatives; and offerings intended for the temple have been appropriated personally. Occasionally, a trustee is prosecuted for his dishonest practices; but it is not often that he is punished. There is so much hard swearing in his favour that he successfully evades the law. He is also aided indirectly by the indifference of the worshipper; the latter gives, not to benefit the temple, but to benefit himself. His sins pass with his money to the Brahman receiver, and his object is fully accomplished in the mere act of giving; it matters little to him how the trustee applies the gift.

The erection of the Hindu temple is the work of a slow system of evolution. Some holy man perhaps dies on the spot, or he has an ecstatic vision of the god in one of the incarnations. The place is invested with sanctity, and an image set up to the deity. The landowner straightway builds a small shelter over it, to propitiate the god in his favour. The ground round the edifice is next enclosed within a fence. By-and-by the shed is removed, and something more pretentious and lasting erected. The Dewan or prime minister of the province makes a pilgrimage to the shrine, and leaves a rich offering in the hands of the Brahmans who have instituted themselves as receivers, trustees, and ministrants. More pilgrims come; offerings in kind as well as in jewels and money pour in, and new buildings are erected. Courts, halls, galleries, a tank, pillared platforms, walls, gateways, and towers, slowly grow around the shrine—the centre-point of the edifice. Other shrines of affiliated deities may group themselves near the original, but the Mulasthanum is always the same. It holds the image of the deity to whom the temple is dedicated, and it is the scene of daily ceremonies. At all risks, it must be jealously guarded against the intrusion of any but the Twice-born. When Clive took the temple of Srieungham—the largest in Southern India, and a powerful stronghold in those days—two thousand fierce Rajputs stood before the door of the Mulasthanum, declaring that the Europeans should only pass in over their dead bodies. Their superstitions were respected, and Clive left the fanatics in undisturbed possession. In preserving the integrity of the sacred shrine the Hindu has something more to consider than his religious scruples. The restitution of the divine or mantric essence is a very expensive and intricate process, requiring large sums of money for its different rites. At Vellore there is a handsome temple which was desecrated years ago by the Mohammedans. They killed a cow in the Mulasthanum. The building now stands empty and unoccupied; and the European may go into outer and inner court as he pleases. The Mulasthanum is a small hall, richly decorated with carving. It contains nothing but a stone dais, on the face of which is a tortoise in outline. The image rested formerly on the tortoise. There is a small gutter round the platform, which conducted the sacred water—used for the ablutions of the idol—into a reservoir outside. Pilgrims drank of this water eagerly, in belief of its miraculous powers of healing and purification. The temple would probably be used again by Hindu worshippers, if money

were forthcoming sufficient to restore the divine essence.

The idol is not usually made of wood or stone. It is moulded in an amalgam of five metals: gold, silver, brass, copper, and lead. In size it is smaller than the human figure. It is not called a 'Swami' until the mantric essence has been infused into it by the proper ceremonies. These are performed by the Brahmans, who claim the power of placing the essence in any object, animate or inanimate, that they choose. Sometimes the object is a man, the chief trustee or 'Moktesoor.' He is then said to be divine, and is called 'Swami'; and, moreover, is worshipped as god. The daily ritual which concerns only the idol takes place inside the shrine at intervals during the day. No worshippers are present except those who are taking part in the function. The image is tended in every minute particular, as though it were a living human being. Nothing is omitted. It is washed with water from the sacred tank; it is dressed and fed. It is supposed to take pleasure in the company of the dancing girls; it sleeps and wakes, and finally is put to bed. During its toilet, hymns of praise are sung, lamps are lighted, camphor and incense burnt, and the tomtom is frequently introduced. Part of the revenue of the temple pays for all this, and a great many Brahmans find their occupation and their living in it.

The ritual of the festivals is much more imposing. The image is covered with plates of gold and loaded with jewels. It is carried in procession upon a huge car, surmounted with a throne of silver. It may now appear before the eyes of all, and it makes a slow and magnificent journey round the outer courts of the temple—which are open to all castes—and through the town. Offerings in kind and in money and jewels are received. The dancing girls are to be seen, their charms enhanced by rich silk and gold; they are the daughters and wives of the god, and the children of the devil. The value of their charms goes to swell the offertory considerably.

But chief of all in the big festival is the Moktesoor—now the Swami—in whose body is hidden the divine essence. His every action, however lustful, is holy. He cannot sin, for he is god; he, too, moves slowly along, and the masses prostrate themselves before him. For several days at a time he personates the deity, and his harvest is great. During this period he assumes what he considers a god-like demeanour. His movements are slow and lethargic; he affects to take no notice whatever of individuals; he receives the adoration and worship offered to him with lofty indifference; he is tended like the idol, and does nothing for himself. It would be beneath his dignity as a god to stir a finger to help himself. He is usually carried on a palanquin raised on bearers' shoulders; and if he walks, a richly embroidered canopy is held over his head by young Brahmans, who have qualified themselves for the honour by the rigid performance of rites.

The question naturally arises, How far do these people believe in themselves? What faith have they in their religion as it is now practised? An educated man who has had some intercourse with Europeans will not scruple to deny his belief in

the images, and in the outward and costly formalities attendant on their worship, if he is speaking with a European. He will talk of idols as symbols; and he will try to represent his religion according as it is written in his philosophical books, and not as it is practised. He will quietly ignore the immoralities of the dancing girls, and the license allowed to the 'guru' when he is travelling amongst his disciples; or, if obliged to admit that these evils exist, he will speak of them as incrustations not materially affecting doctrine itself. He will seem by his conversation ripe for reformation and almost ready for conversion. But he has two sides to his character. He is one man abroad, and another in the bosom of his family. As a native paper puts it, he roars like a lion at a public meeting; but in the presence of his women-folk at home he is the meekest of meek little jackals. Amongst the worshippers, it is the women who hold so tenaciously to the superstitions of their religion. It is by their decree that the men attend these festivals; it is at their suggestion that the gifts are made; it is with their consent that the men obtain religious license for deeds not in accordance with Christian morality—deeds not mentioned in their own sacred books. The powerful attractions offered to the weakest side of human nature, together with the play upon his fearful superstitious mind, hold the heathen worshipper closely to his creed.

As for the Brahman, his very existence rests on his religion. It is his support, his livelihood; it is his grand source of wealth. The princely revenues of the temples are more than sufficient to ensure a jealous preservation of the Mulas-thanums and their mysteries by the favoured Twice-born, whatever may be their convictions.

THE IRONCLAD BUSHRANGERS.

AUSTRALIA has furnished many startling tales of the careers of numerous criminals who have at various times carried on the profession of 'bush-ranging;' but none of more intense interest than that of the notorious 'Kelly gang.' This quartet of desperadoes for a considerable length of time set the law, government, and police of New South Wales and Victoria at complete defiance. A reward of eight thousand pounds was offered without avail for their apprehension; and despite the incessant efforts of the police of the two colonies, the four youths who composed 'the gang' evaded punishment for two years, and cost these two governments in all the enormous sum of one hundred and fifteen thousand pounds!

Ned Kelly, 'the last of the bushrangers,' was born at Wallan-Wallan in 1854. At an early age he took to criminal courses, and was a known horse-stealer from his youth. His brother Dan was born in 1861, and was a thorough specimen of a juvenile scoundrel. Steve Hart (born in 1860) was likewise a professional horse-thief. Joe Byrne was born in 1857, and also in his young days commenced his evil ways.

These four composed the band; and in 1878, when they first became notorious, the leader, Ned Kelly, was only in his twenty-fourth year;

and the others were lads, two of them still in their teens. The origin of the outbreak was as follows: In April 1878 a police-officer named Fitzpatrick was sent to arrest Dan Kelly at his mother's house at Greta. While in the house, a scuffle took place, and Ned Kelly shot Fitzpatrick in the wrist. Mrs Kelly and several others were convicted of abetting the outrage; but Ned and Dan took to the bush, and nothing was heard of them for several months. In October, a party of police, under the command of Sergeant Kennedy, set out to scour the Wombat Ranges, where they had information the Kellys were hiding. The party camped out the first night; and next morning Kennedy, accompanied by another officer named Scanlan, went off to search the hills. The other two officers remained in camp. About two o'clock, the two men were suddenly saluted with a command to 'throw their hands up.' On looking round, they discovered four rifles aimed at them. One of the police, McIntyre, being unarmed, at once obeyed. His companion drew his revolver and made for a tree for shelter; but before he could get behind it, he was shot dead. The murderers then came forward, and McIntyre recognised them as the two Kellys with Hart and Byrne. Securing all the arms in the camp, the outlaws at once made preparations for the reception of the other officers. McIntyre was placed in a conspicuous situation, while the bushrangers remained out of sight. Soon afterwards, Kennedy and Scanlan rode up. McIntyre called out, as ordered: 'Sergeant, you had better surrender, as we have been captured.' Ned Kelly at the same time cried 'Hands up.' Grasping the situation in a moment, the officers sprang from their horses. Scanlan was shot dead ere he reached the ground. Kennedy got safely down, and got behind his horse, opening fire upon his assailants. The horse, however, bolted, and rushing past McIntyre, he jumped into the saddle and galloped off. Kennedy was now left alone to fight the four outlaws. No one knows what really then occurred, or how long the police-officer continued the unequal struggle. But he had to succumb at last; and his body was afterwards found a quarter of a mile away, riddled with bullets.

McIntyre meantime rode off as fast as his horse could carry him. He got safely to Mansfield, and gave the alarm. As may be imagined, the news of the sanguinary outbreak created intense consternation throughout the colonies. A reward of one thousand pounds was offered for the capture of the gang, and every possible means adopted for their speedy apprehension.

About noon on the 18th of December a man named Fitzgerald, employed on a station near the small township of Euroa, was accosted by an individual who had the appearance of an ordinary bushman. On finding out that the manager, Mr Macauley, was from home, he beckoned three others out of the bush; and the party at once proceeded to the homestead. Mrs Fitzgerald, who was in charge, demanded who they were

and what they wanted. One of the party at once said: 'I am Ned Kelly, and we want food for ourselves and our horses.' Fitzgerald then came in, and was met with the same demand, emphasised by the production of a revolver. Shortly afterwards, the station hands began to drop in to dinner. Every one as he arrived was seized, and all shut up together in a detached storehouse. About five o'clock Mr Macauley, the manager, arrived. He was at once covered by the revolvers of the outlaws and ordered to 'bail up.' Resistance being useless, he at once surrendered. The next arrival was a travelling merchant with a wagon of clothing and other articles. He was also 'bailed up' and locked up with the rest.

Euroa was a small town about three miles from the station. It had then about three hundred inhabitants, and is on the main line of railway from Melbourne to Sydney. Next morning the outlaws openly declared their intention of robbing the bank at Euroa. Four men returning to town were also captured that day, and added to the already numerous company of prisoners. The next step of the gang was to destroy telegraphic communication, and they proceeded to cut down the posts and wires of the line, which was carried along the railway close to the farm-buildings. While engaged at this work, a party of four railway 'gangers' came up. They also were shut up in the storehouse, which then contained some twenty men! At half-past three, Ned and Dan Kelly, accompanied by Steve Hart, set off for the town. They had taken advantage of the hawk's stock of clothing to rig themselves out in a highly respectable style. The two Kellys each drove a light cart, and Hart rode behind on horseback. Joe Byrne was left in sole charge of the prisoners. He was heavily armed, and kept a close watch to see that no one got off to give the alarm. While thus occupied, a train came up and stopped opposite the station. The breakdown in the telegraph was noticed, and a repairer got off to make matters right. He came up to the homestead for assistance, when Byrne at once 'drew a bead' on him, searched him for arms, and locked him up with the others!

Meantime, the other three desperadoes had reached Euroa. Ned Kelly drew up his cart at the bank door on the main street, while his brother and Hart went to the back. It being after hours, it was a short time ere the door was opened; but on Kelly's declaring he had a cheque of Mr Macauley's to cash, he was admitted. Instead of a cheque, Ned presented a revolver at the astonished clerk, who at once succumbed. Hart at the same time entered from the back and secured all the firearms on the premises. Kelly next entered the room of the manager, Mr Scott, and he also surrendered at discretion. Leaving him under Hart's care, Ned ransacked the bank, obtaining some three to four hundred pounds in cash. The accountant was then ordered to open the safe, from which Kelly took fifteen hundred pounds in notes, three hundred pounds in gold, ninety pounds in silver, and some thirty ounces of gold-dust.

Their object having been accomplished, it was now time for the gang to depart. However, to prevent an alarm being prematurely raised, it

was necessary to take all the inmates of the bank along with them. This was a formidable task, the household consisting of Mr and Mrs Scott, her mother, seven children, two maid-servants, and two clerks. This being more than the two wagons could accommodate, Mr Scott's buggy was got out. Into it Mrs Scott and the children were packed, the former driving. The others were divided between the two carts, and the procession drove off. Steve Hart rode alongside and kept a watchful eye on the prisoners.

On their arrival at the station the men were put in the storehouse with the others, the women and children being allowed the run of the place. Having divided their spoil, the four outlaws partook of a hearty meal and at last rode off. Mr Scott hurried back to Euroa. He got there about midnight, and found the inhabitants still in blissful ignorance of the robbery in their midst.

Again, despite the efforts of the police, the gang got clear off. The reward was increased to four thousand pounds, but without avail.

About two months elapsed ere the gang was again heard of. On the 11th of February 1879 the bank at Jerilderie was 'stuck up' and robbed. The police-station is a short way outside the town. At midnight on the 9th the two officers in charge were aroused by some one calling that there was a great row in the town and their presence demanded at once. On opening the door, the two constables were seized by four armed men, whom they immediately recognised to be the notorious 'Kelly gang.' They were disarmed and ignominiously locked up in their own watch-house. Next morning, Sunday, they found out that one of the officers' wives was in the habit of going into town and preparing the little church for service. Knowing her non-appearance might occasion inquiries being made, Joe Byrne made her accompany him to town, perform her usual duties, and return with him. At eleven o'clock next forenoon the four set out for the town, the two Kellys on foot and in police uniforms, Hart and Byrne on horseback. They first went to the *Royal Hotel*, which they had resolved should form their base of operations. They walked boldly in, proclaimed who they were, and taking advantage of the confusion caused by their appearance, at once secured possession of the premises. The landlord, servants, and all others in the house were marched into one room and locked in. Joe Byrne then proceeded to the bank. This office was in the charge of three gentlemen—Mr Jarleton, the manager; Mr Liding, the accountant; and Mr Mackin, the clerk. Mr Liding was the only one of the three in the office, and on Byrne entering, was at once ordered to 'bail up!' Ned and Byrne rummaged the office and got some seven hundred pounds in all. Not satisfied with this, they compelled the manager to open the safe, where fourteen hundred and fifty pounds more were obtained. About six o'clock the outlaws departed, Byrne leading a packhorse with the plunder. They safely crossed the Murray River, and got back unmolested to their retreat in the mountains of Victoria.

The utmost consternation now reigned throughout the two colonies. The Governments along with the banks increased the reward for the

capture of the brigands to the sum of eight thousand pounds. One of their principal 'agents' was a young fellow named Aaron Sherritt, and overtures were now made to him to induce him to put the police on the right track. Aaron was shy at first; but after a time he agreed to do what he could. Many believed he was only 'humbugging' the police; but the sequel proved he was in earnest. Being a sweetheart of a sister of Joe Byrne's, he was supposed to be well acquainted with the gang's movements. Old Mrs Byrne resided in a solitary dwelling among the hills. Here, sooner or later, Sherritt declared the bushrangers would come; and it was determined to watch the place night and day. A strong party of police under Superintendent Hare took up a position amongst the rocks above Mrs Byrne's house. Great care was taken to avoid the danger of their presence being known, and for many weeks the officers lay there, enduring severe discomforts and hardships. The nights were intensely cold; but a fire could not be lit; and the only food they had was bread and tinned meats. Old Mrs Byrne at last had her suspicions aroused; her watchful eye detected the glitter of an empty meat-can amongst the rocks; and creeping through the bush, she walked right into the camp, which had consequently to be abandoned.

Aaron Sherritt now cut his connection with the Byrnes and married another young woman. He took up house, however, in the same locality. A German named Wicks lived near him; and on the 26th of June 1880 Wicks received a visit from Joe Byrne and Dan Kelly. They handcuffed him, and made him go with them to Sherritt's house. On their arrival there he was ordered to call Aaron out on the pretence that he had lost his way. The ruse was successful, and Sherritt opened the door. Joe Byrne then stepped forward and fired at him. He retreated within doors; but Byrne sprang forward, and firing a second time, Sherritt fell dead on the floor. It was on Saturday night that Sherritt was shot; and early on the Sunday morning a railway repairer named Reardon, at Glenrowan, was awakened by Ned Kelly and Steve Hart and ordered to dress himself immediately. He obeyed, and was then made to summon several others of the men; and the whole were made to get their tools and march down the line. When they arrived at a part where the track ran along the top of a high embankment, they were ordered to tear up the rails! Knowing that as soon as the murder of Sherritt became known, a strong force of police would be despatched to the scene of the outrage, they had resolved to sacrifice the lives of the whole party! No regular trains ran on Sunday, and the special would, they expected, come along at full speed, and be thrown over the embankment without a moment's warning. The workmen protested against being employed in such devilish work; but no heed was taken of their entreaties. Under pain of instant death and with loaded pistols at their heads, they were compelled to obey, and the rails were lifted.

All the workmen were marched off to the *Glenrowan Hotel* (a small wooden building), and there kept under strict surveillance. Dan Kelly and Byrne now appeared on the scene, having gal-

loped across country from Beechworth, after their murderous work there. The four now perambulated the little hamlet; the inhabitants were all ordered up to the hotel, where in all there were sixty-three people including the police-officer of the village. Meantime, news of Sherritt's murder had reached the authorities, and, as the outlaws anticipated, a special train was despatched for Beechworth with a large force of police and trackers. This train reached Glenrowan about eleven at night, having been delayed on the road. It was not intended to stop there; but when about a mile from the station, a danger signal was seen in front. On drawing up, this proved to be the schoolmaster of the place with a candle and a scarlet scarf in front of it. He had managed to elude the vigilance of the bushrangers, and at once hurried down the line, just in time to stop the train. This was the first news the police had of the gang's presence at Glenrowan.

Within the hotel there was intense excitement when the sound of the approaching train was heard. The gang prepared to sally forth to witness the success of their villainous project, and in the confusion the imprisoned constable managed to escape. He at once ran down to the station when he heard the train stop. On his way he met Mr Hare and the police hurrying up to the hotel. All was in total darkness when they got in sight. The officers cautiously approached, and when Superintendent Hare was about sixteen yards from the house, a shot was fired from the veranda. The bullet hit Mr Hare in the left hand, rendering it useless. Other shots followed, and the police energetically replied. Once, above the din, the voice of Ned Kelly was heard shouting: 'Fire away, you beggars; you can do us no harm!' His meaning was unknown at the time, but was explained afterwards. Up to this time the police were unaware of any persons being within the buildings besides the outlaws. But now, when the bullets were crashing through the frail walls, they began to take effect on the prisoners. Several persons were wounded, and the shrieks of the women and children were added to the uproar. The bushrangers, finding the fire of their assailants getting heavier, now left the veranda and retreated inside. More police now arrived from Benalla and Wangaratta. A heavy volley was fired into the hotel, and this—as was known afterwards—proved fatal to Joe Byrne, who was shot in the groin, and died in agony. The police kept up a careful watch throughout the night, to prevent any of the gang escaping under cover of darkness. Just as dawn was breaking a fresh sensation arose. A tall figure emerged from the gloom and stalked slowly and calmly into the thick of the police. The latter, not knowing who the new-comer was, paused, and when within easy distance, the man opened fire upon them with his revolver. Now began a combat almost indescribable in its character. Nine policemen surrounded their solitary foe and emptied their firearms at him from a few yards' distance. He was repeatedly hit, and seen to stagger, but with a derisive laugh, he continued to return their fire. For half an hour the unequal fight went on—one man with a revolver against nine with rifles! At length one of the officers changed his tactics, and stepping close up

to him, fired two shots into his legs. Then at last the man fell; but even when brought to the ground he continued the fight. A rush was then made upon him, and he was disarmed.

This proved to be Ned Kelly, the chief of the gang; and the secret of his boldness was now discovered. His head, chest, back, and sides were protected by sheets of iron! He was speedily stripped of his armour and conveyed to the station, where he was found to be wounded in two places in the left arm, two in the right leg, and also in the right foot. His armour showed he had been also hit seventeen times by the police bullets.

Dan Kelly and Steve Hart were now left in the hotel. Most of the townspeople had been afraid to leave; but they now made a rush out, perfectly terror-stricken, and imploring the police not to shoot them. After this, an incessant fire was kept up by the police. For a time the outlaws replied, but about one o'clock it was noticed they discontinued firing. The police at this time were at their wits' end, and telegraphed to Melbourne for a fieldpiece to be sent up to batter the place down! This was actually despatched by train; but its services were not required. It was ultimately resolved to set fire to the building. A strong fusillade was again directed upon the hotel, to cover the operations, and a bundle of straw was placed against the boards and set fire to. The flame soon took hold; and then a cry got up that there was a wounded man inside who had been unable to leave with the others. All this time no sign of the two bushrangers was seen or heard. A clergyman, Father Tierney, volunteered to try to save the wounded man, and while he courageously entered at the front, several policemen rushed in at the back. In a few seconds they reappeared from amidst the smoke bearing the man between them. They also brought out the dead body of Joe Byrne. But besides, they had important news to tell. The other two outlaws—Dan Kelly and Steve Hart—were found lying dead on the floor. Whether they had been shot by the police, or taken their own lives to avoid capture, is unknown. The flames now quickly spread, and in a short time the place was burned to the ground. The charred remains of the bushrangers were afterwards recovered. Each of them, like their chief, was incased in armour. Ned Kelly's suit weighed ninety-seven pounds, and had been rudely constructed out of ploughshares.

Thus, at last, the Kelly gang was put an end to, the last scene being of a thoroughly sensational and unexpected character. Had the plan of destroying the train with the police been successful, it was the intention of the gang to ride to Benalla and rob the banks there. These plans were carefully thought out; and to avoid interference with their nefarious work, a keg of powder and fuse was prepared with which to blow up the Benalla Bridge, and so cut off communication with the other side of the river.

Ned Kelly recovered of his wounds, and was condemned and hanged at Melbourne. His old mother's last words to him were: 'See you die like a Kelly!' His bravado, however, deserted him at the last, and he showed anything but a bold front on the scaffold.

Those of our readers desiring fuller particulars

of the 'Kelly gang' and other records of crime in the Australian colonies are referred to Superintendent Hare's book, *The Last of the Bushrangers*, recently published in London.

RAILWAYS IN THE FUTURE.

RAILWAYS, though instituted more than fifty years ago, are still in their infancy, and there is no denying the fact that this infant institution has progressed beyond the anticipations of the original promoters of the great trunk lines. Year by year some marked improvement is visible, either in the matter of speed or comfort; and though there is finality in all things, it does not appear that the present generation will witness the absolute perfection of railway travelling. Our fathers were satisfied with travelling two hundred miles in ten hours; they grumbled not at the hard straight-backed third-class carriage; and the flickering light in the roof-lamps, clouded with smoke and dirt, was borne with an equanimity hardly credited at the present day; yet in less than a quarter of a century the slow parliamentary train for long distances is all but extinct; the third-class passenger can now travel his two hundred miles in five hours by any train in a comfortable cushioned carriage; and at night, the electric light or gas enables him to read with pleasure, and gives the compartment a bright and cheerful aspect. The third-class passenger, who was once treated as of no consequence, and for whom anything was considered good enough, is now the chief consideration with railway directors. The masses are gradually and surely becoming the arbiters of what shall be and what shall not be. As far as comfort and speed are concerned, there is little cause of complaint at the present day; but the public are not satisfied with other matters; they have agitated for cheaper rates for their merchandise, and when that concession is granted, there will be a move for the reduction in passenger fares.

The zone system, adopted with success in Hungary, is already advocated for trial in this country; and there has even been a scheme propounded for free railway travelling; but neither of these suggestions could be carried out while railways are in the hands of several companies, each working their line as it suits them best. Whether the Board of Trade can force the hands of the companies in the matter of reduction in rates and fares, remains to be seen; but there must be a limit to that interference, or the only alternative will be for the State to take over the railways and work them itself. There is a growing feeling that this will eventually be done, and the only strong argument against such a scheme is, that through want of competition there would be a lack of energy and improvement in the service generally that would militate against the public advantage. If this were to be so, that argument would be sufficient to settle the question.

The case of the German railways being taken over by the State is given as an instance where the public have suffered in the matter of general

facilities by the change, although it is admitted that from a pecuniary point of view the working has been most satisfactory. But the British public will hardly take such an example as sufficient evidence against the advisability of the transfer of our railways to the State. There is a power in this country that can and has ruled the State, a power that centuries of parliamentary government has made supreme—Public Opinion. In Germany, the voice of the people is little more than a whisper, and consequently it seldom reaches the powers that be; and when it does, there is no force at the back of it to give the rulers a hint that it would be policy to give it some attention. The consequence is that the German Government manage their railways without the criticism of the public or of bodies of shareholders.

With us it would be different; and we have in the Post-office an example of splendid efficacy in state management of a great public business without the aid of competition. Any neglect or bad management in that service is made the subject of a question in the House of Commons, where there are always sufficient members present of a progressive turn of mind to add their voice in favour of improvement. It would be the same if our railways were managed by the Government. Such a change would result in many advantages to the public. The working expenses would drop at least twenty-five per cent., and the profits, after the Government dividend on the Railway Consols had been paid, would go towards reducing rates and fares. The zone or any other system which necessitates the railways being under one management could then be worked permanently or on trial. Cheaper travelling is sure to come in the future; but with the working expenses so high as they now are, railway directors cannot see their way to make a change which would involve them in trouble with the shareholders.

Like all great changes in this country, whether religious, political, or commercial, this one must bide its time till the public are ready for it and pronounce in its favour; and though years may elapse before it takes place, yet the change will certainly come about eventually. Railway officials from the highest to the lowest would probably prefer to be servants of the State rather than of a public company; as Civil servants, they would expect to find that promotion would be by merit, and not by favour, as it largely is at the present time; long hours would then be the exception, not the rule; and Sunday duty would be paid for, which it is not at present, except under certain conditions. All servants in the passenger department of our railways are paid at the rate of seven days a week, so that theoretically they should work every Sunday to earn a full week's wage; but this arrangement is gradually being replaced by a more considerate one which allows every servant to be off duty at least one Sunday in every two. It is an old adage that says, 'Those who live longest will see most;' and before the present generation of railway men have passed away, they will have much to be thankful for, as compared with the conditions of the service which obtained in their early days.

We have not been in the habit of copying the

Americans in railway matters, and it was never thought that the ways of American railways would suit the British taste; but there is gradually growing up a change in this opinion. We have tried the Pullman cars, and they are becoming more popular with us: and it is not improbable that one company will decide for the future to build all their carriages on that principle. When, years ago, the second class was abolished on the Midland Railway, it was generally thought that a mistake was made, and that in time the old order of classes would have to be reverted to; but we see now that other companies are following in the same direction, and it is even mooted in certain quarters that it is the intention of one railway company to do away with classes altogether. If this is so, it is not at all improbable that our railways in the future will be worked on the same lines as are the American railways. This would break down the reserve and exclusiveness which is peculiar to the British traveller, and do much towards making liberty, equality, and fraternity something more than a theoretical doctrine in this aristocratic country.

CONSTANT.

I GIVE you back your word again;
Why should I hold it now?
Why should I see you try in vain
To keep a plighted vow?
And so to-day I say good-bye
Without reproach or tear,
Without one sob or bitter cry
To tell that you were dear.

And just because my love has grown
No whit more weak or cold,
I make no angry plaint or moan
Nor speak of days of old;
But yet I will not have you say,
Because I give no blame,
That if you're weak and false to-day,
That I may be the same.

Not so. Together bound are we,
Bound by a golden chain;
No words you speak can set me free,
Nor ease my bitter pain.
You need not think the love that grew
And strengthened day by day
Within my trustful heart for you,
I now can cast away.

And if it chance the world should be
Unfeeling or unkind:
Should fickle fortune turn and flee,
And leave you far behind:
Should all your summer friends depart,
In cold and proud disdain:
My love shall live safe in my heart,
Should you need it again.

INFIRMITY AND OLD-AGE PENSIONS.

MUCH is likely to be heard ere long of schemes now being matured by leading British statesmen for a national system of Pensions for Old Age. An influential Committee of both Houses of Parliament has the subject in hand; and meantime the Foreign Office has obtained from Her Majesty's representatives in the European capitals a series of valuable Reports respecting assistance afforded or facilities given by foreign Governments to similar movements. No such assistance is given in Austria-Hungary, the Netherlands, Norway, Sweden, Spain, or Turkey; but France, Germany, Denmark, Russia, and several other countries have extensive schemes, either in immediate prospect or already in operation.

In Germany, the law of compulsory insurance against old age and infirmity—passed in June 1889—completes the programme of legislation for improving the condition of the working-classes which was set forth in the Imperial Rescript of the 17th of November 1881. It affects a portion of the population numbering more than thirteen millions, giving them an inalienable legal claim to support in cases of infirmity and in old age. The insurance is compulsory in all industrial occupations upon persons of both sexes over sixteen years of age. Clerks, trade employees, and tradesmen's apprentices who do not earn more than one hundred pounds per annum also participate; but, oddly enough, assistants and apprentices in apothecaries' shops are excluded. Exemption from compulsory insurance is granted to persons who work for food, clothes, and lodging only, and receive no pay, or who are only in temporary employment. The pension for old age varies from £5, 6s. 4d. to £9, 11s. per annum, and is granted to every insured person who has completed the seventieth year of his age, irrespective of his ability to earn a livelihood, provided that he does not already draw a pension for infirmity. The latter ranges from £5, 11s. to over £20, and is given, irrespective of age, to any person who is permanently

incapacitated from earning his living. The pension can be refused if the infirmity has been brought on wilfully or in the act of committing a crime. A person is considered infirm if unable to earn more than about one-third of his usual wage. Habitual drunkards may be made to receive their pensions entirely in kind. In such cases the pension is paid to the parish authorities, who supply the person concerned with his food, clothing, &c. In order to establish a claim to a pension under the German law, contributions, regulated by the amount of earnings, must be paid for a prescribed period. The means of paying pensions are obtained by fixed contributions from the Imperial Treasury added to regular payments on the part of the employers and employed. Side by side with this system there continues in operation the law which compels miners to become members of approved friendly societies.

In France there is still before the Chamber of Deputies a Bill in which the Government proposes an enormous development of the system of providing for old age. After 1848 a great number of projects for the benefit of the poorer workmen were brought forward; the 'right to labour and to State assistance' having been formally recognised by the Constitution. Amongst the more practical of the many well-intentioned but often hastily-evolved schemes was that of a 'Caisse de Retraite pour la Vieillesse,' which was carefully elaborated by the Labour Committee. Its object was to receive the very small deposits that labouring men were enabled to make—sums too small for the insurance companies to accept, owing to the cost and inconvenience of the largely increased clerical labour which the keeping of these small accounts would entail. The Caisse was not originally intended in any way to usurp the functions of ordinary insurance offices. The advantage granted by the State was only designed for the benefit of those who had neither the resources, experience, nor leisure to look for and find a safe and remunerative investment of their savings. The development of this

system was slow and chequered, owing to limitations introduced from time to time, on account of an excessive rate of interest not only attracting the wrong class of depositors, but also involving the State in serious loss. Deposits may be made in favour of any person over three years of age; but in the case of minors the authority of a parent or guardian is necessary. Each deposit gives the right to an annuity which is immediately fixed; and there is no obligation to continue payments at stated intervals. Deposits can be made at any time in variable sums. The depositor must mention the age at which he wishes to enjoy his pension; the age must not be less than fifty. After fixing one age for the pension on one deposit, he may name another for the pension on another. By three months' notice before the date of the term when the pension becomes due, the payment may be deferred with the view of increasing its ultimate amount; but after the age of sixty-five the pension must be taken. Payments are received in all sums from a franc upwards, without fractions of francs. The maximum annuity for one person is fifty-eight pounds, and deposits of more than forty pounds cannot be made in one year. The total value of the pensions granted since the institution of the Caisse des Retraites has been £1,956,943 to 251,084 persons; of these latter, 166,937 are still alive, receiving pensions amounting to £1,268,907. In a new and more extended scheme now under examination by the Commission du Travail, the Government propose to impose a maximum contribution of a halfpenny or a penny per day on each salary, putting an equal charge on the employer of labour. Thirty years of halfpenny payments per day would produce, at the four per cent. now in force, a pension of £7, 2s.; of a penny per day, £14, 4s. It is proposed in the Bill before the Chambers that the State should add two-thirds of the amount deposited by the workmen and their employers. Every person of French nationality receiving a salary will be assumed to take the benefit of the proposed law, unless he make a declaration to the contrary before the mayor; and without such declaration every employer will be bound to deduct a halfpenny at least, or a penny at most, from the daily wage he gives, supplemented by a like sum of his own. If a workman has deposited a sum from twenty-five years—the age at which these payments begin—to fifty-five years of age, then at fifty-six years of age, and till the end of his days, he will be in receipt of his pension. In order to encourage the employment of French labour, masters who employ foreign workmen will have to pay a penny per day for each such foreigner to a fund which is for the benefit of French workmen.

A novel and highly interesting experiment in the same direction is now being made in Denmark. Not many months ago the Danish government proposed to put a new tax upon lager beer. To this the Radicals replied that, if the poor man's beer was to be taxed, the poor man ought in some way to get the advantage; and for this purpose they proposed an old-age pension scheme. The Government persisted in their beer tax, but took over the pension scheme, and made it even more Radical, inasmuch as under their plan no

contributions were to be required. Instead of contributions, they have devised an ingenious test, which makes it a necessary qualification for a pension that the applicant shall not have had recourse to the poor-law or been convicted of vagrancy during the ten years preceding the age of sixty. If he has a clean record in this respect, he may, on completing his sixtieth year and on showing proof of necessitous circumstances, lay claim to a pension of about ten pounds a year. The decision rests with the Communal Councils; and whatever funds are required, in addition to the money provided by the beer tax, will have to be found locally.

In Belgium, the legislature has recently voted, under the Budget for 1891, a credit of twenty thousand francs for giving bonuses of encouragement to recognised Mutual-help Societies, in order to facilitate the affiliation of their members to the State fund for retirement. Pensions to old workmen and their widows are granted by most of the Miners' Relief Societies throughout Belgium.

In Greece, a tax of a hundredth part of a drachma is levied on the net produce of mines, in order to form a reserve fund to assist workmen and their families in case of accident.

In Italy, the subject of State intervention in favour of pensions in cases of illness, incapacity to work, and old age, has been discussed in both the Italian Cabinet and also in the Chamber, where a project of law with that view has recently been submitted by the Ministry. It is proposed that the capital shall be derived from the sums subscribed by the workmen, increased partly by the net profits of the Postal Savings-banks, by the shares of predeceased members, &c. After twenty years from the first subscription, these amounts would be transformed into annuities and redivided per head.

Russia has made several attempts to solve the same problem; and in Switzerland an additional Article to the Constitution was voted last year by the Federal Assembly, and subsequently adopted by the people at the Referendum, empowering the Confederation to legislate on the subject of compulsory insurance against accidents and illness; but it is not the present intention of the Federal Government to include in their promised measure any scheme of insurance for old age and infirmity.

THE IVORY GATE.*

By WALTER BESANT.

PROLOGUE (*continued*).

THE room was long rather than square, lit by two large windows, overlooking the gardens of New Square, Lincoln's Inn. The lawyer sat with his back to the fire, protected by a cane-screen, before a large table. On his left hand, at the corner of the table, stood the clients' chair: on his right hand, between the two windows, was a small table with a couple of drawers in it. And in the corner, to the left of any one writing at the small table,

* Copyright 1892 in the United States of America by Harper & Brothers.

and on the right hand of the lawyer, was the open safe already mentioned. There were two doors, one communicating with the clerk's room, the other opening directly on the stairs. The latter was locked on the inside.

'Call Mr Arundel,' said the chief.

While Checkley was gone, he walked to the window and observed that any one sitting at the table could, by merely reaching out, take anything from the safe and put it back again unobserved, if he himself happened to be occupied or looking another way. His grave face became dark. He returned to his own chair, and sat thinking, while his face grew darker and his eyes harder, until Mr Arundel appeared.

Athelstan Arundel was at this time a recently admitted member of the respectable but too numerous family of solicitors. He was between two and three and twenty years of age, a tall and handsome young fellow, of a good manly type. He was an ex-articled clerk of the House, and had just been appointed a Managing Clerk until something could be found for him. The Arundels were a City family of some importance: perhaps something in a City Firm might presently be achieved by the united influence of family and money. Meantime, here he was, at work, earning a salary and gaining experience. Checkley—for his part, who was as jealous of his master as only an old servant, or a young mistress, has the right to be—had imagined symptoms or indications of a growing preference or favour towards this young gentleman on the part of Mr Dering. Certainly, he had Mr Arundel in his own office a good deal, and gave him work of a most confidential character. Besides, Mr Dering was Executor and Trustee for young Arundel's mother, and he had been an old friend and school-fellow of his father, and had known the young man and his two sisters from infancy.

'Mr Arundel,' the lawyer began. At his own house, he addressed his ward by his Christian name: in the office, as managing clerk, he prefixed the courtesy title. 'An extremely disagreeable thing has happened here. Nothing short of a forgery.—Don't interrupt me, if you please'—for the young man looked as if he was about to practise his interjections.—'It is a most surprising thing, I admit. You needn't say so, however. That wastes time. A Forgery. On the 5th of this month, three weeks ago, a cheque, apparently in my handwriting, and with my signature, so skilfully executed as to deceive even Checkley and the Manager of the Bank, was presented at my bank and duly cashed. The amount is—large—£720—and the sum was paid across the counter in ten-pound notes, which are now stopped—if there are any left.' He kept his eyes fixed on the young man, whose face betrayed no other emotion than that of natural surprise. 'We shall doubtless trace these notes, and, through them of course, the forger. We have already ascertained who presented the cheque. You follow?'

'Certainly. There has been a forgery. The forged cheque has been cashed. The notes are stopped. Have you any clue to the forgery—any suspicions?'

'As yet, none. We are only beginning to collect the facts.' The lawyer spoke in the coldest and most austere manner. 'I am laying them, one by one, before you.'

Young Arundel bowed.

'Observe, then, that the forged cheque belongs to a cheque book which has been lying, forgotten by me, in this safe for two years. Here is the book. Turn to the last counterfoil. Here is the cheque, the forged cheque, which corresponds. You see?'

'Perfectly. The book has been in the safe for two years. It has been taken out by some one—presumably the forger—the cheque has been forged: the counterfoil filled up: and the book replaced. Why was all this trouble taken? If the man had got the cheque, why did he fill up the counterfoil? Why did he return the book? I beg your pardon.'

'Your questions are pertinent. I come to the next point. The safe is never opened but by myself. It is open so long as I am in the room and at no other time.'

'Certainly. I know that.'

'Very well. The man who took out the cheque book, forged the cheque, and replaced the book, must have done it in my very presence.'

'Oh! Could not some one—somehow—have got a key?'

'I thought of that. It is possible. But the drawers are full of valuables, jewellery—curios—all kinds of things which could easily be turned into money. And they were not touched. Now, had the safe been opened by a key, these things would certainly have vanished.'

'So it would seem.'

'These are the main facts, Mr Arundel. Oh! one more. We have found the messenger who cashed the cheque. Perhaps there are one or two other points of more or less importance. There is only one more point I wish to bring before you. Of course—I make no charge—I insinuate none. But this must be remembered—there are only two persons who have had access to this safe in such a manner as to make it possible for them to take anything out of it—Checkley'—

'No—no—no,' cried the old man.

'And you yourself. At the time of the robbery, you were working at that table with the safe open and within reach of your left hand. This is a fact, mind—one of the facts of the case—not a charge.'

'What?' cried the young man, his cheek aflame—'you mean'—

'I mean nothing—nothing at all. I want you—and Checkley—who alone have used this room, not counting callers who sat in that chair—to know the facts.'

'The facts—yes—of course—the facts. Well'—he spoke rapidly and a little incoherently—'it is true that I worked here—but—oh! it is absurd. I know nothing of any cheque book lying in your safe. I was working at this table'—he went to the table—'sitting in this chair. How could I get up and search about in a safe for an unknown and unsuspected cheque book before your very eyes?'

'I do not know. It seems impossible. I only desire you to consider, with me, the facts.'

Had Mr Dering spoken just a little less coldly, with just a little less dryness in his manner, what followed would perhaps have been different.

'Yes—the facts,' repeated the young man.

'Well—let us get at the facts. The chief fact is that whoever took that cheque and filled it up must have known the existence of that cheque book more than two years old.'

'It would seem so.'

'Who could know about that old cheque book? Only one who had been about your office more than two years, or one who had had opportunities of examining the safe. Now, you sat there—I sat here'—he seated himself, only turning the chair round. 'How is it possible for a man sitting here to take anything out of that safe without your seeing him? How is it possible for him, without your knowledge, to examine slowly and carefully the contents of the safe?'

'Everything is possible,' said Mr Dering, still coldly. 'Let us not argue on possibilities. We have certain facts before us. By the help of these, I shall hope to find out others.'

'At five o'clock every day I put the work in the drawer of this table and I go away.' He opened the drawer, as if to illustrate this unimportant fact. He saw in it two or three pieces of paper with writing on them. He took them out. 'Good Heavens!' he cried. 'They are imitations of your handwriting.'

Checkley crossed the room swiftly, snatched them from him, and laid them before his master. 'Imitations of your handwriting,' he said. 'Imitations—exercises in forgery—practice makes perfect. Found in the drawer. Now!'

Mr Dering looked at the papers and laid them beside the forged cheque. 'An additional fact,' he said. 'These are certainly imitations. The probable conclusion is that they were made by the same hand that forged this cheque.'

'Found in the drawer,' said Checkley, 'used by Mr Arundel. Never by me. Ah! The only two, are we? These imitations will prove that I'm not in it.'

'The fact that these imitations are found in the drawer,' said Mr Dering, 'is a fact which may or may not be important.'

'What?' cried the young man, flaring up. 'You think that I made those imitations?'

'I do not permit myself—yet—to make any conclusions at all. Everything, however, is possible.'

Then this foolish young man lost his temper and his head.

'You have known me all my life,' he cried. 'You have known me and all my people. Yet at the first moment you are ready to believe that I have committed a most abominable forgery! You—my father's oldest friend—my mother's Trustee! My own Guardian! You!'

'Pardon me. There are certain facts in this case. I have laid them before you. I have shown'—

'To suspect me,' Arundel repeated, 'and all the time another man—that man—your clerk—who knows everything ever done in this office, is in and about the place all day long.'

'The imitations,' said Checkley quietly, 'were found in his own drawer—by himself.'

'Who put them there? Who made them? You—villain and scoundrel!'

'Stop, stop,' said Mr Dering coldly. 'We go too fast. Let us first prove our facts. We will then proceed to conclusions.'

'Well, sir, you clearly believe that I forged

your name and robbed you of all this money. I have not got ten pounds in the world; but that is not, I suppose, a fact which bears on the case. You think I have seven hundred pounds somewhere. Very good. Think so, if you please. Meanwhile, I am not going to stay in the service of a man who is capable of thinking such a thing. I leave your service—at once. Get some one else to serve you—somebody who likes being charged with forgery and theft.' He flung himself out of the room and banged the door behind him.

'He has run away,' said Checkley. 'Actually, run away at the very outset! What do you think now?'

'I do not think. We shall, I daresay, find out the truth in due course. Meantime, these documents will remain in my keeping.'

'Only, I hope, sir,' the clerk began, 'that after what you've just seen and heard, after such insolence and running away and all'—

'Don't be an ass, Checkley. So far as appearances go, no one could get at the safe except you and Arundel. So far as the ascertained facts go, there is nothing to connect either of you with the thing. He is a foolish young man; and if he is innocent, which we must, I suppose, believe—but his look did not convey the idea of robust faith—he will come back when he has cooled down.'

'The imitations of your handwriting in his drawer'—

'The man who forged the cheque,' said Mr Dering, 'whoever he was, could easily have written those imitations. I shall see that hot-headed boy's mother, and bring him to reason.—Now, Checkley, we will resume work. And not a word of this business, if you please, outside. You have yourself to think of as well, remember. You, as well as that boy, have access to the safe. Enough—enough.'

Athelstan Arundel walked home all the way, foaming and raging. No omnibus, cab, or conveyance ever built could contain a young man in such a rage. His mother lived at Pembroke Square, which is four good measured miles from Lincoln's Inn. He walked the whole way, walking through crowds, and under the noses of dray-horses, carriage-horses, and cart-horses, without taking the least notice of them. When he reached home, he dashed into the drawing-room, where he found his two sisters—Hilda and Elsie—one of them a girl of eighteen, the other of thirteen. With flaming cheeks and fiery eyes, he delivered himself of his story: he hurled it at their heads: he called upon them to share his indignation, and to join with him in scorn and contempt of the man—their supposed best friend, Trustee, Guardian, Adviser—their father's best friend—who had done this thing—who had accused him, on the bare evidence of two or three circumstantial facts, of such a crime!

There is something magnetic in all great emotions: one proof of their reality is that they are magnetic. It is only an actor who can endow an assumed emotion with magnetism. Elsie, the younger girl, fell into a corresponding sympathy of wrath: she was equal to the occasion: passion for passion, she joined him and fed the flame. But—for all persons are not magnetic—the elder sister remained cold. From time to

time she wanted to know exactly what Mr Dering had said: this her brother was too angry to remember: she was pained and puzzled: she neither soothed him nor sympathised with him.

Then the mother returned, and the whole story was told again, Elsie assisting. Now, Mrs Arundel was a woman of great sense: a practical woman: a woman of keen judgment. She prided herself upon the possession of these qualities, which are not supposed to be especially feminine. She heard the story with disturbed face and knitted brow.

'Surely,' she said, 'what you tell me, Athelstan, is beyond belief. Mr Dering, of all men, to accuse you—you—of such a thing! It is impossible.'

'I wish it was impossible. He accuses me of forging that cheque for £720. He says that while I was working in his office for him, a fortnight ago, I took a certain cheque book out of the safe, forged his writing on a cheque, and returned the cheque book. This is what he says. Do you call that accusing, or don't you?'

'Certainly. If he says that. But how can he—Mr Dering—the most exact and careful of men? I will drive to Lincoln's Inn at once and find out. My dear boy, pray calm yourself. There is—there must be—some terrible mistake.'

She went immediately; and she had a long interview with the solicitor.

Mr Dering was evidently much disturbed by what had happened. He did not receive her as he usually received his clients, sitting in his arm-chair. He pushed back the chair and stood up, leaning a hand on the back of it, a tall, thin, erect figure, gray-haired, austere of face. There was little to reassure the mother in that face. The very trouble of it made her heart sink.

'I certainly have not accused Athelstan,' he said. 'It is, however, quite true that there has been a robbery here, and that of a large sum of money—no less than £720.'

'But what has that to do with my boy?'

'We have made a few preliminary inquiries. I will do for you, Mrs Arundel, what I did for your son, and you shall yourself understand what connection those inquiries have with him.'

He proceeded coldly and without comment to set forth the case so far as he had got at the facts. As he went on, the mother's heart became as heavy as lead. Before he finished, she was certain. There is, you see, a way of presenting a case without comment which is more efficacious than any amount of talk; and Mrs Arundel plainly perceived—which was indeed the case—that the lawyer had by this time little doubt in his own mind that her son had done this thing.

'I thought it right,' he continued, 'to lay before him these facts at the outset. If he is innocent, I thought, he will be the better able to prove his innocence, and perhaps to find the guilty person. If he is guilty, he may be led to confession or restitution. The facts about the cheque book and the safe are very clear. I am certain that the safe has not been opened by any other key. The only persons who have had access to it are Checkley and your son Athelstan. As for Checkley—he couldn't do it, he could not possibly do it. The thing is quite beyond him.'

Mrs Arundel groaned. 'This is terrible,' she said.

'Meantime, the notes are numbered: they may be traced: they are stopped: we shall certainly find the criminal by means of those notes.'

'Mr Dering'—Mrs Arundel rose and laid her hand on his—'you are our very old friend. Tell me—if this wretched boy goes away—if he gives back the money that remains—if I find the rest—will there be—any further—investigation?'

'To compound a felony is a crime. It is, however, one of those crimes which men sometimes commit without repentance or shame. My dear lady, if he will confess and restore—we shall see.'

Mrs Arundel drove home again. She came away fully persuaded in her own mind that her son—her only son—and none other, must be that guilty person. She knew Mr Dering's room well: she had sat there hundreds of times: she knew the safe: she knew old Checkley. She perceived the enormous improbability of this ancient clerk's doing such a thing. She knew, again, what temptations assail a young man in London: she saw what her Trustee thought of it: and she jumped to the conclusion that her son—and none other—was the guilty person. She even saw how he must have done it: she saw the quick look while Mr Dering's back was turned: the snatching of the cheque book: the quick replacing it. Her very keenness of judgment helped her to the conviction. Women less clever would have been slower to believe. Shameful, miserable termination of all her hopes for her boy's career! But that she could think of afterwards. For the moment the only thing was to get the boy away—to induce him to confess—and to get him away.

He was calmer when she got home, but he was still talking about the thing: he would wait till the right man was discovered: then he would have old Dering on his knees. The thing would be set right in a few days. He had no fear of any delay. He was quite certain that it was Checkley—that old villain. Oh! He couldn't do it by himself, of course—nobody could believe that of him. He had accomplices—confederates—behind him. Checkley's part of the job was to steal the cheque book and give it to his confederates and share the swag.

ROMANCE OF THE TELEGRAPH.

A CERTAIN romantic interest has clung to the telegraph from the beginning, in spite of its utilitarian character. The idea of two friends corresponding at a distance by means of two magnetic needles having a sympathy in their movements was emitted by John Battista Porta, the Neapolitan philosopher, in the sixteenth century, and took hold of the popular imagination. Addison has an amusing paper in the 'Spectator,' in which he represents two lovers conversing with each other in secret by the sympathetic stone. A veil of mystery still hangs around the first plan for an electric telegraph, communicated to the 'Scots Magazine' for 1753 by one 'C. M.' of Renfrew. Even the name of this obscure and modest genius is doubtful; but it is probable that he was Charles Morrison, a

native of Greenock, who was trained as a surgeon. At this period only the electricity developed by friction was available for the purpose, and being of a refractory nature, there was no practical result.

But after Volta had invented the chemical generator or voltaic pile in the first year of our century, and Oersted, in 1820, had discovered the influence of the electric current on a magnetic needle, the illustrious Laplace suggested to Ampère, the famous electrician, that a working telegraph might be produced if currents were conveyed to a distance by wires, and made to deflect magnetic needles, one for every letter of the alphabet. This was in the year 1820; but it was not until sixteen years later that the idea was put in practice. In 1836 Mr William Fothergill Cooke, an officer of the Madras army, at home on furlough, was travelling in Germany, and chanced to see at the university of Heidelberg, in the early part of March, an experimental telegraph, fitted up between the study and the lecture theatre of the Professor of Natural Philosophy. It was based on the principle of Laplace and Ampère, and consisted of two electric circuits and a pair of magnetic needles which responded to the interruptions of the current. Mr Cooke was struck with this device; but it was only during his journey from Heidelberg to Frankfort on the 17th of the month, while reading Mrs Mary Somerville's book on the *Correlation of the Physical Sciences*, that the notion of his practical telegraph flashed upon his mind. Sanguine of success, he abandoned his earlier pursuits and devoted all his energies to realise his invention. The following year he associated himself with Professor Wheatstone; a joint patent was procured; and the Cooke and Wheatstone needle telegraph was erected between the Euston Square and Camden Town stations of the London and Birmingham Railway. To test the working of the instruments through a longer distance, several miles of wire were suspended in the carriage-shed at Euston, and included in the circuit. All being ready, the trial was made on the evening of the 25th of July 1837, a memorable date. Some friends of the inventors were present, including Mr George Stephenson and Mr Isambard Brunel, the celebrated engineers. Mr Cooke, with these, was stationed at Camden Town, and Mr Wheatstone at Euston Square. The latter struck the key and signalled the first message. Instantly the answer came on the vibrating needles, and their hopes were realised. 'Never,' said Professor Wheatstone—'never did I feel such a tumultuous sensation before, as when, all alone in the still room, I heard the needles click; and as I spelled the words I felt all the magnitude of the invention, now proved to be practical beyond cavil or dispute.'

It was in 1832, during a voyage from Havre to New York in the packet *Sully*, that Mr S. F. B. Morse, then an artist, conceived the idea of the electro-magnetic marking telegraph, and drew a design for it in his sketch-book. But it was not until the beginning of 1838 that he and his colleague, Mr Alfred Vail, succeeded in getting the apparatus to work. Judge Vail, the father of Alfred, and proprietor of the Speedwell iron-works, had found the money for the experiments; but as time went on and no result was achieved,

he became disheartened, and perhaps annoyed at the sarcasms of his neighbours, so that the inventors were afraid to meet him. 'I recall vividly,' says Mr Baxter, 'even after the lapse of so many years, the proud moment when Alfred said to me, "William, go up to the house and invite father to come down and see the telegraph-machine work." I did not stop to don my coat, although it was the 6th of January, but ran in my shop-clothes as fast as I possibly could. It was just after dinner when I knocked at the door of the house, and was ushered into the sitting-room. The judge had on his broad-brimmed hat and surtout, as if prepared to go out; but he sat before the fireplace, leaning his head on his cane, apparently in deep meditation. As I entered his room he looked up and said, "Well, William?" and I answered: "Mr Alfred and Mr Morse sent me to invite you to come down to the room and see the telegraph-machine work." He started up, as if the importance of the message impressed him deeply; and in a few minutes we were standing in the experimental room. After a short explanation, he called for a piece of paper, and writing upon it the words, "A patient waiter is no loser," he handed it to Alfred, saying, "If you can send this, and Mr Morse can read it at the other end, I shall be convinced." The message was received by Morse at the other end, and handed to the judge, who, at this unexpected triumph, was overcome by his emotions.'

The introduction of the telegraph by land or sea has been attended with numerous adventures, especially in wild countries, but few of these have been recorded. One of the most romantic expeditions was that of the Western Union Telegraph Company of America, who in 1865 projected an overland telegraph from the United States to Europe via Behring Strait. Parties were sent out to explore the route and build the line through British Columbia, Alaska, and Siberia as far as the Amur River; and during the three years of the work they encountered many hardships and privations. One of a band was lost in the thick woods of Vancouver Island, and though he could hear the bugle calls of the searching-party, he was too exhausted to respond. On the fourth day of his wandering he wrote his will in pencil on his pocket-handkerchief; but soon afterwards he stumbled on the trail, where some hunters found him lying insensible. Another, while chasing cariboo on the Upper Fraser River, was lost for two weeks. In climbing a tree to spy his position, a branch gave way, and he fell to the ground. Stunned and bruised, he lay there for two days, then managed to reach the bank of the Fraser. He constructed a raft of logs and floated down the current; but after a time the raft stuck on a bar and afterwards floated away without him. By following the stream he at length came to a clearing in the forest, and was saved by Chinese settlers. For twelve days he had lived on the bulbs of the gamass, a species of lily, and on berries gathered amongst the trees. In Siberia, during winter, one at least of the expedition was frozen to death on the steppes, and others nearly starved for want of provisions.

Working the telegraph, though in general monotonous, is frequently enlivened by an interesting or exciting message. Such, for example,

was the despatch received in Washington, United States, on the morning of the 3d of April 1865, which announced the fall of Richmond and the termination of the great rebellion. About half-past nine, while Mr William E. Kettles, a boy operator of fifteen, was engaged in the Washington office attending to the service of the line which ran to Fortress Monroe, he was startled by a call from there to 'Turn down for Richmond, quick!' With trembling fingers he obeyed, and in another moment the signal from Richmond flashed along the wire. 'Do you get me well?' they said. 'I do: go ahead,' was the reply.—'All right. Here is the first message for four years—Richmond, Va., April 3d, 1865. Hon. E. M. Stanton, Secretary of War; we entered Richmond at eight o'clock this morning.—G. Weitzel, Brigadier-General, commanding.'

Kettles copied the message, he knew not how, and rushed with it into the room of General Eckert, Assistant Secretary of War, where he found President Lincoln conversing in a low tone with Mr Tinker, a cipher clerk. As Kettles handed the despatch to Tinker, the President, catching sight of its purport, bounded from the room, with a hop, skip, and jump, exclaiming, 'Clear the track!' and made for the door of Secretary Stanton. The tidings flew like wildfire; and soon the operating room was filled with officers of state, and the building was besieged by an enthusiastic crowd, who demanded a speech from the distinguished Kettles.

The telegraph played an important part in the American Civil War, and many daring deeds were perpetrated in cutting the wires or 'tapping' them to filch the messages. Some of the operators of the military service were so expert as to receive the messages on their tongues by the 'taste' of the current. In the Franco-German War of 1870 the uhlans in particular played havoc with the French wires. On arriving at a village they would ride up to the telegraph office, cut the connections, and carry off the apparatus, or else employ it to deceive the enemy. They were outwitted, however, on one occasion, and by a woman. Mademoiselle Juliette Dodu, a girl of eighteen, was director of the telegraph station at Pithiviers, where she lived with her mother, when the Prussians entered the town. They took possession of the station, and turning out the two women, confined them to their dwelling on a higher floor. It happened that the wire from the office in running to the pole on the roof passed by the door of the girl's room, and she conceived the idea of tapping the Prussian messages. She had contrived to keep a telegraph instrument, and by means of a derivation from the wire was able to carry out her purpose. Important telegrams of the enemy were thus obtained, and secretly communicated to the sub-prefect of the town, who conveyed them across the Prussian lines to the French commander.

Mademoiselle Dodu and her mother were both arrested, and the proofs of their guilt were soon discovered. They were brought before a court-martial, and speedily condemned to death; but the sentence had to be confirmed by the commander of the corps d'armée, Prince Frederick Charles, who, having spoken with Mademoiselle Dodu on several occasions, desired her to be produced. He inquired her motive in committing

so grave a breach of what are called the 'laws of war.' The girl replied: 'Je suis Française' (I am a Frenchwoman). The Prince confirmed the sentence; but happily, before it was executed, the news of the armistice arrived and saved her life. In 1878 this telegraphic heroine was in charge of the post-office at Montreuil, near Vincennes; and on the 13th of August she was decorated with the Legion of Honour by Marshal MacMahon, President of the Republic.

The ignorance and superstition of natives unacquainted with Western civilisation have been a fruitful source of incident, both comical and tragical, in telegraph experience. In China, when the telegraph line was built at Foochow from the pagoda to the foreign settlement, the people broke it every night, believing it would spoil the 'fung-shui' or good-luck of the district, and the mandarins winked at the destruction.

The Arabs, as a rule, have taken kindly to the telegraph, partly, it is thought, because the word is readily understood by them, 'tel' meaning wire, and 'araph' to know, in Arabic, so that 'telaraph' becomes to learn by wire. The Indians at the Baird fishing-station on McCloud River, California, call the telephone 'Klesch-teen' or the 'Speaking Spirit,' and regard it as a 'great medicine.' The red men have been taught by the cunning Yankees to respect the telegraph. When the overland line across the prairies was completed between Fort Kearney and Laramie, Mr Creighton invited the chief of the Arapahoes at Fort Kearney to hold a palaver with his friend the chief of the Sioux at Fort Laramie. The two Indians exchanged telegrams, and were deeply impressed with the fact. Mr Creighton said the telegraph was the voice of the Manitou or Great Spirit; and to carry conviction, he suggested that they should meet each other half way along the line, which was about five hundred miles in length. The chiefs started on horseback, met, and compared notes. The story spread among the tribes; and ever after, it is said, the line and instruments were unmolested, though the linesmen might be killed and the stations threatened.

The duty of a linesman is to keep the wire in repair, and in wild countries it is frequently a hazardous occupation. In journeying along the line many miles from the distant station, he is sometimes picked off by the lurking savage, or drowned in crossing some swollen creek. In 1867 Mr W. Thompson, a repairer of the Union Pacific Railway Company, was travelling on a hand-car with five others, beyond the Plum Creek Station, looking out for a break in the line, when they were suddenly fired on by a band of Indians. Thompson was shot and scalped, and left for dead. But not long afterwards he walked into the station bringing the scalp in his hand. It had been dropped by one of the Indians, and picked up by its owner. According to our authority (the 'Telegrapher' for August 31, 1867), a doctor of Omaha was of opinion that he might be able to replace it!

The Australian blacks, who are so low in the scale of humanity, have proved very hostile to the telegraph. They are apt to cut the wire to tip their spears with it, and break the insulators to make scrapers of the sharp edges.

Some of the stations on the great overland wire which crosses the continent from Adelaide on the south coast to Port Darwin on the north, where it meets the cables from Europe, are built in the manner of a fortress. Such is the station at Barrow's Creek, about twelve hundred miles north of Adelaide, which was the scene of a desperate attack by the natives in 1874. This lonely outpost of civilisation stands on the bank of a stony creek in the middle of a wide plain, covered with dried grass and stunted bushes, broken with patches of sombre forest or tangled scrub, and the blue range of some low hills fading in the distance. The buildings were of rough-hewn stone, loopholed for musketry, and roofed with iron. They formed three sides of a square, embracing a courtyard, which was closed by a massive gate, the only entrance to the station. The place was garrisoned by a staff of eight, including Mr Stapleton, the telegraph master, six operators, linesmen or servants, and a native boy christened Frank.

Mr James L. Stapleton, or 'Stape' as he was familiarly called, had been a free operator in America for over twenty years, roving from line to line as whim or opportunity directed, now plying his 'key' in the airiest of costumes amid the jungles of the tropics and the haunts of the dreaded 'vomito'; again shivering in furs beside his 'speaker' among the snows of the north, from the Panama and Aspinwall line to the Grand Trunk of Canada. In 1858 he wandered to Australia, and worked on the Victorian lines for ten years. At length he was appointed to the charge of the maintenance station at Barrow's Creek; and leaving his wife in North Adelaide, departed for the interior, hoping to spend his days in rest and quiet there.

About eight o'clock on Sunday evening, February 22, 1874, all the staff were outside the station, enjoying the pure air of the plains and the mellow light of the sunset. One or two are said to have been bathing in the creek; while others were smoking their pipes and chatting with the 'boy' Frank, whom they proposed to send up the line on horseback with one of the linesmen, when a large band of natives suddenly showed themselves at the eastern corner of the station, and launched a volley of spears at them. Being unarmed, they sprang to their feet, and made a rush for the entrance to the fort, but ere they could reach it were scattered by another shower of weapons. Retreat being cut off, they ran round the building, thinking the blacks would follow them. The ruse succeeded; and at the next venture they gained the courtyard and shut the gate. Though several were wounded, they were all inside except the boy Frank, who, however, was saved by being dragged in through one of the barred windows in the front of the station. Those who were able armed themselves with rifles, and three shots were fired through the openings at the body of natives where they assembled, some twenty yards distant. These drew off hastily, but gathered again at a point a hundred yards off, when two other shots were fired at them. All was quiet during the night; but about seven o'clock next morning the blacks were seen to approach again, all armed, and evidently bent on a fresh attack. But they were

dispersed by four rifle-shots while they were yet at a distance of five hundred yards. An examination of the injured showed that Mr Stapleton had been deeply gashed with a spear in the left side, and also cut in the left thigh. John Frank, a linesman, had been speared on the right side, the blade traversing his heart and the tip protruding from his back in a downward slant. He died as soon as he entered the kitchen of the fort. Flint, an operator, was speared in the upper part of the leg to the very bone; Gason, a police trooper, was also injured; and the boy Frank had a hurt below the right collar-bone, a spear-cut between two of his left ribs, and his right hand badly torn. Stapleton's condition was critical, and a telegram was sent to Adelaide, describing the nature of his injuries and asking for medical advice. This was done by Mr Flint, although he was bed-ridden and suffering intense pain. Dr Gosse of Adelaide prescribed by telegraph; but the remedies proved ineffectual. When Stapleton was sinking fast, his wife came to the telegraph office at South Adelaide to communicate with her dying husband, who on his part whispered his last wishes to the wounded operator at Barrow's Creek; and thus, although separated by twelve hundred miles of scrub and desert, these two exchanged a solemn and sad farewell. Stapleton was buried next day, the 24th of February, while the natives sullenly watched the rites from a distance.

Disease is a more fatal enemy to the telegraph clerk than the savage. His calling often takes him into climes and localities to which his constitution is unsuited. In the hotter countries, for example, hundreds of operators have succumbed to the malaria or yellow fever. During the fall of 1878, an epidemic of yellow fever broke out in the Southern States of America, in particular at Key West, New Orleans, and Granada. Business was entirely suspended; there was an exodus of the rich; but the poor whites and the blacks were rendered destitute and unable to flee from the scourge. Fever and starvation went hand in hand. In such a condition of things the telegraph is the only mode of communication between the infected districts and the outer world, the only means of getting medical aid and supplies, or of directing doctors and the officers of public health. A few of the telegraph clerks took fright, and fled to the north on this occasion; but most of them continued at their posts, and volunteers supplied the places of those who deserted or died in the execution of their arduous duties; for at such a time the work is redoubled, and the operator, exhausted in mind and body by the continual strain, is very liable to catch the fever. In Granada at one time all the telegraphists succumbed to the pestilence except Mr William W. Redding, a railway operator, who, being left alone, was the sole link between the stricken community and their sympathising countrymen. The traffic of the town itself was great; but he managed by incessant labour to sustain it and to send reports of its condition to the 'New York Times' and the 'Cincinnati Inquirer.' At the end of one of his despatches to the 'Inquirer' he expressed a fear that he could not write coherently, as the room in which he worked contained four persons down with the fever, and one corpse. These were his wife, his

mother, and two sisters; the corpse was that of his child. At last, however, he was seized, and died—as true a hero as ever lost his life upon the field of battle.

More recently, when the yellow fever broke out in Florida in the autumn of 1888, a young lady named Miss Mamie Davis kept her post in the Telephone Exchange of Jacksonville when all the other operators were stricken with the disease. She sat at the switch-board from morning till night, snatching hurried bites of food between the calls for doctors, undertakers, ambulances, and so forth, and apparently without thinking that she was doing anything unusual or brave.

Overwork itself has claimed its victims in America, where competition is perhaps more severe than in the government telegraphs of Europe. In 1884 an operator known as 'Ned Cummins,' and employed in a Virginian office, was receiving a press report, when he signalled to the sending operator at the other end of the line: 'Been spitting blood lately—take it easy.' Directly afterwards he fell from his chair dead; but there was no delay in the press report, for another took his place and wired the sending clerk: 'Cummins just died; I'm his substitute. Go ahead after "address"—that being the last word written by Cummins when he was called away.

About the same time another operator, 'Monk Monroe,' finding himself while in the midst of his work stricken with the blindness of death, had just time to signal on the wire, 'Send a doctor; I'm going up the hill.' He was found 'relieved' for ever, with his hand still resting on the key.

SUNSTRUCK.*

CHAPTER IV.

DAYS of hard work beneath the torrid sun, and nights without rest, when freeman and bondman toiled together beneath the dim light of many lanterns. Gun and shot and heavy stores were landed; but the ship stuck fast, as if her keel were firmly wedged in the rocks.

Then the whole crew, reinforced by a hundred of the blacks from the plantation, ran from side to side, to the great delight of the slaves, to whom the rhythmic motion seemed a kind of dance, to which they set up one of their weird choruses, caught by the Jacks at once, and trolled out with all the force of their powerful lungs; but that night and another passed. The ship had not moved.

'*Nil des.*, captain,' said Greville. 'The weather has held right and we may do it yet.'

'But I am beginning to despair, sir,' said the captain wearily.

'Let's see what to-morrow brings forth,' said Greville.

It brought forth what neither expected.

Burns, who was working literally like a slave, side by side with Manton in the hot sun, helping

the men to get up ballast from the hold, suddenly dropped as if he had received a bullet.

The doctor was hurried to the poor fellow's side, and pronounced the attack to be due to over-exertion in the heat.

Both the captains came; and the doctor gave orders for the stricken man to be carried below, when Greville interposed.

'No, no, captain,' he said; 'it is like condemning the poor fellow to death. The heat and noise will increase his fever. Let him be carried ashore to my house. Two of the women on the estate are excellent nurses.'

Captain Lance glanced at the doctor, who nodded.

'It will be the saving of his life,' he said.

'I don't like trespassing on you further, Mr Greville.'

'Captain Greville, if you please,' said the planter stiffly.

'Captain Greville. But if you will have the poor fellow for a day or two.'

'I shall be hurt if you do not send him,' was the reply.

The result was that the captain's gig was manned, and it became Manton's duty to see his friend safely up to the plantation house, the surgeon being one of the party.

'Is he very bad, doctor?' said Manton as they were rowed over the sea, which shone like hot metal.

'Very bad, poor lad. You see the exertion has been terrible. He has not spared himself a bit.'

'Officers must set a good example,' said Manton sadly; and then, noting for the first time the figure of one of the plantation blacks in the bows, he flushed a little, and said sharply: 'Hullo, my man, getting away from the work?'

'Mass' Cap'n say Negus go up to house tell um get room ready.'

'I beg his pardon,' said Manton; 'I misjudged him.—Poor old Will! you mustn't let him slip through your fingers, doctor.'

'I shall do my best, and I counsel you to take warning and be careful. The work under this sun is too much. Why, the very birds and insects get into the shade, while we human beings keep on toiling regardless of the heat.—Ah, here we are,' he continued as the boat's bow grated on the sand. 'How are we to get him up? Ah! Good gracious! Why, the side of the boat literally burned my hand.'

'We will get him carefully on to this sail,' said Manton, as the black went off at a trot for the house. 'Three men on each side to hold the canvas. He'll ride easily enough then.'

'Capital!' said the doctor; and he stood looking on as the young lieutenant was tenderly lifted out of the boat and placed upon the spread-out sail where it had been stretched upon the sands.

'Now, my lads, lift—all together,' said Manton. 'Keep step. Go slowly.—No, no, my lad,' he continued, as he bent down; 'take hold this way. That's right. Now together. Lift. Forward.—That sand glows like fire, doctor,' he added. 'Seemed quite to scorch my face.'

'Why, Manton, man—what is it? Hold up!'

* Copyright reserved in the United States of America.

'Yes,' said the young man thickly, 'sand—glows—I—what?—my head—feels'—

He made a sudden snatch at vacancy, reeled, and was saved from falling by the surgeon lowering him down on a patch of green growth just beyond the sand.

'Is he ill too, sir?' said one of the men respectfully, for they had halted as soon as they saw their officer down.

'Ill too, my lads,' said the surgeon bitterly. 'Struck down. We cannot leave him here till we get the other up.'

'No, sir,' said the man; 'we can take him too.'

'Impossible.'

'Not it, sir, if we lay 'em crostways. There's three on us to each; and if we says we will, we will; eh, messmets?'

'Ay, ay,' came in a low deep growl, full of willingness to help; and a few minutes after they were going slowly up toward the house with their double load; but it was lightened before they were half-way there, for the messenger came back with another stalwart black, the negroes each seizing a side of the sail; and a few minutes later they reached the shade of the broad veranda, and then bore the two sick men into the dark, cool hall, a couple of elderly black women coming forward to meet them, but only to stop as Renée and Josephine stepped out from one of the side-rooms.

The doctor started, and took off his hat.

'I beg pardon,' he stammered; 'I was not aware.'

'The room is ready,' said Renée.

'Thank you, my dear young lady, thank you; but, unfortunately, another of our officers has been taken ill on the road.'

'Another room shall be prepared directly,' said Renée quietly. 'Josee, dear, will you ask?—'

She did not finish her sentence, being struck by her companion's manner, for Josephine had snatched a vessel of cold water from a table in the hall, soaked her handkerchief therein, and was bending down now over Manton, with a look in her eyes entirely fresh. But the next minute she seemed to realise what was required, and hurried away to see to the preparation of another room.

'Humph!' muttered the doctor; 'he said he had good nurses up at the house. If I were down, and had such nurses as these, I should never want to get well.—Eh? I beg your pardon,' he added with some confusion, for Renée had spoken.

'I said, would you tell your men to carry the gentlemen to their rooms?'

'Yes, yes; thank you. Of course,' cried the doctor.—'Now, my lads, carefully. One at a time.'

'Hah!' he muttered, half an hour later, as he looked down at his patients in their tastefully arranged, well-ventilated bedrooms. 'Very nice. Ten times the chance of getting better; but—but—Oh, dear me! I'm rather afraid of this arrangement turning out all wrong.'

CHAPTER V.

A ship is always called 'she,' and there are plenty of unkind misogynists who sneeringly say it is because a vessel is as capricious as a woman.

Certainly the sloop of war wedged in the coral rock a quarter of a mile from the shore was capricious enough. Everything had been done in the way of lightening her; the crew and their black auxiliaries had tramped and danced from side to side, and the two captains stood together one glorious evening gazing at each other in despair. They had become very friendly; for Captain Greville, in spite of his long absence from the sea, had proved himself to be a ripe sailor; and Captain Lance had soon thrown aside all punctilio, and gladly availed himself of plenty of sound advice.

'No, sir,' said Greville, 'I can do no more. I am at my wits' end. It is piteous, though. Such a fine vessel and quite uninjured. Lance, I'm sorry for you.'

'It's maddening,' said the latter. 'Wrecked my ship in a calm. They'll never give me another.'

'No; I'm afraid not,' said Greville. 'You'll have to do as I do: turn planter.'

'If we could only have got an anchor down, and the capstan manned.'

'Yes. But impossible; there are goodness knows how many hundred fathoms below us here. We ought to have got her off. The weather, too, has been perfect. Give the men a rest for a few hours, and let's see if we cannot hit out some other plan.—Here; I have it. Let's get the guns aboard again all aft, and fire a salvo. That might start her, and—Hurrah! Cheer, my lads, cheer!'

The men responded with a wild shout, in which the blacks took part, for, as the two captains were speaking, the swell, which had for days past been rolling in so gently, pressed slowly and heavily against the stern of the ship, and seemed to glide under her; she careened over a little to starboard, and then lifted and slowly drifted off into deep water, her masts describing an arc across the sky.

The next moment the two officers had grasped hands.

'Greville,' said Captain Lance, in a voice full of emotion, 'you have saved me, my ship, and my future prospects as an officer. Now, then, what is to be done?'

'Get your guns and stores on board, man,' said Greville bluntly.

'Of course, but I mean about you. Shall you claim salvage?'

'Of course not.'

'Then the government must'—

'Leave me alone,' said Greville interrupting. 'What! do you want them to give me a command?'

'Yes: why not?'

'No: that's all over. I'm afraid I was not a good officer. My fate went another way. I'm happy enough here with my two dear girls and my black people.'

'Yes, but you must have some reward.'

'Give it me then—the thanks of a brother-officer.'

'You've had that from the first. But your men?'

'My blacks? Get the work done, man; and then rig up an awning all over the deck, give them a hearty meal, and then make the fiddler strike up, and let them dance and sing. I'll

give your boys a treat ashore.—There, get your boats out and sound for an anchorage. You'll get one under the shelter of that headland. I'm as glad as an old sailor can be who has had the pleasure of saving one of the king's ships.'

That night *The Queen* lay snugly at anchor; and the next morning the boats began going to and fro to embark guns, ammunition, and stores once more. Then in due course followed the entertainments to the blacks and the sailors, and the announcement that the ship would continue her journey farther south.

Captain Greville was on board on the eve previous to their setting sail, when the doctor came up to make his report after being ashore.

'Well,' said the captain; 'how are your patients?'

'The two lads who were hurt by the slipping of that gun are getting on well. They are coming aboard to-night as soon as it's a bit cooler.'

'Yes; but Manton and Burns?' said Captain Lance impatiently.

'They are getting better. The crisis is past, and it is only a question of nursing now.'

'That's right,' said the captain; and Greville raised his brows and looked sharply from one to the other. 'Take the gig to-night and some bedding, and superintend the poor fellows being brought aboard.'

'What for?' said Greville bluntly. 'Do you want to begin your voyage with a couple of funerals at sea?'

'My dear sir!'

'Well, I'm right,' said Greville. 'The poor fellows are mere shadows. It would kill them if they were moved.—Wouldn't it, doctor?'

'In a few hours,' said the doctor decisively.

'Tut—tut—tut—tut!' ejaculated Captain Lance. 'What am I to do? I can't sail without my officers.'

'You would have to if they died,' said Greville. 'There; go on, and call for them as you come back from the south. Going right down to the Falklands, aren't you?'

'Yes; but those two poor lads!'

'They'll be all right. I think we can nurse them back to health.'

'But it is not fair to leave them on your hands, Greville.'

'Nonsense! Then I'll keep account of the cost, and send you in a bill.'

'You will?' cried Captain Lance eagerly.

'No; I won't, man. Hang it all! I thought we two were getting to be quite friends.'

'And so we are,' cried Captain Lance.—'But, doctor, what do you say?'

'That it is their only chance of life.'

'And about medical assistance? I can't leave you.'

'Bah!' said the doctor shortly. 'They don't want me.'

No one noticed his peculiar intonation, and matters were arranged so that the sick men should stay.

Next morning, as John Manton lay on his couch in the shaded room, he heard the gun fired soon after the captain and his brother-officers had been to say farewell.

'Look out, nurse,' he said to the ugly black

woman seated near his head; and his voice sounded very weak and strange.

'S, massah,' said the woman; and she went to the window. 'All de big white sail hang down, and de ship go sail along, and de boys shout.'

'Ah!' sighed Manton; 'and I am so weak. Go and tell Mr Burns that the ship has sailed, and that we are left behind—perhaps to die,' he added to himself.

The woman went into the adjoining room, and returned at the end of a minute.

'Why have you been so long?' said Manton, in a querulous whisper.

'Massah Burn say um want lilly drink o' water, sah.'

'Well?'

'An' I give um lil drop o' coolum drink.'

'Yes, yes; but did you tell him the ship had sailed?'

'S, massah.'

'And what did he say?'

'Say noting, massah. Can't say. All so weak. Only make lil whisper.'

'Well, you heard him?' said Manton feebly.

'Oh yes, massah; but massah no talk so much. Not good for um head.'

'But tell me what he said, and I will not speak.'

'Massah Burn whisper very small 'deed, and um say close in my ear, when I tell um ship sail away: "Berry good job too."'

CHAPTER VI.

Breakfast-time at the plantation, and Josephine busy in front of a glass, pinning a brilliant scarlet flower just at the side of her glossy black hair. She was very simply dressed in flowing creamy drapery, which showed her lithe figure to perfection.

'How late she is!' muttered the girl, as she glanced at her handsome face, and a faint tinge, the result of her satisfaction, sprang to her warmly hued cheeks.

At that moment, while her back was turned, Renée entered, and stopped short, smilingly watching as she saw how her companion was engaged.

'Why, Josee,' she cried, 'down so soon!'

'Yes, of course,' cried the girl. 'Have you not always been scolding me for being late?'

'Morning, girls,' said Captain Greville, entering through the French window. 'That's right: I want my breakfast.'

He kissed them both tenderly, Josephine last, and holding her with one arm as he patted her cheek.

'That's right, my dear,' he said. 'Glad to see you look so much brighter. You quite fidgeted me a little while ago. I was afraid you were going to be ill.'

'It was very hot then,' she said hurriedly.

'Nay, it was unusually cool,' said the captain, laughing. 'Why, girls, I must take you to the old country some day, and let you see really cold weather with ice and snow.'

He took his seat at the table, and noticed that his adopted child was as attentive to his wants as Renée.

'What is the news about the patients?' he said.

'Aunt 'Miramis says they have both had an excellent night,' said Josee eagerly.

'You have seen her this morning?'

'Yes, I just saw her and asked,' said Josephine quickly.—'Give me some more coffee, Renée, dear.—Papa, you are not making a good breakfast.'

'Oh yes, I am, child.—Well, that's good news about the sailor boys. I want to have them fit for service by the time *The Queen* comes back. 'Miramis is an excellent nurse, but somehow she is a woman I rather mistrust.'

'But she is very good and kind,' cried Josephine quickly. 'It is her manner that is against her.'

'I do not mind her manner,' said Renée quietly. 'She always seems to me insincere.'

'Ah well, never mind,' said the captain, 'so long as she does her duty.'

He took out a letter which had reached him a day or two before, and began reading it as he sipped his coffee. It was for the third or fourth time, for letters were rarities in those days at such an out-of-the-way island; and as he read, the girls kept silence, only exchanging glances twice, when Josephine looked at Renée furtively, and then flushed as if in resentment at being watched. On the second occasion, she turned away angrily, and Renée seemed pained, gazing at her adopted sister appealingly, and then sighing; and her thoughtful young face grew troubled, as she saw how Josephine kept her eyes averted.

As soon as the breakfast was over, the latter left the table and went out into the garden.

Directly they were alone, Greville said quietly: 'You have noticed how Josee has altered during the last week or two?'

'Oh yes, papa, and it has troubled me.'

'Troubled? Because she seems so animated and gay?'

'Yes, dear.'

'Oh, nonsense, child! *Femme souvent varie*. You are as changeable as she is. I am glad to see it.—Well, this will not do. I must get in the saddle and ride round before the sun gets too hot. I'll go up and see the sailors, though. I think I shall have them down and out in the garden.'

'Yes, papa,' said Renée, with rather a troubled air.

'Yes, my dear, I shall lock up the medicine chest now, and prescribe fresh air. Lucky for them I'm such a quack. One can't go on doctoring one's people all these years without knowing a little about our ailments. I did save your life, pet.'

'Yes, dear,' said Renée, clinging to him; 'but I never knew how bad I was.'

'No, I suppose not. And then you responded by saving mine.'

'Oh no, papa.'

'But I say, oh yes.—Well, I'll go up now.'

The captain went up to Burns's room to find that gentleman carrying on a conversation with his nurse; and drawing back unseen, he went into the next room, and then stopped short in astonishment.

'Josee, my child!' he exclaimed.

'Yes, papa dear, I have just brought Mr Manton

a bunch of these fresh flowers,' said the girl hastily.

'Yes, Captain Greville,' said Manton from the couch upon which he lay looking very white and thin. 'I don't know how I am ever to express my thanks for all the kindness I receive here.—Thank you very much for the flowers, Miss Maine. 'Miramis shall put them in water. I never knew how much pleasure flowers could give till I was sick like this.'

'Oh, it is nothing,' said the girl hastily, and she hurried away.

Greville's brow cleared as Josephine left the room, and he drew a chair to the side of the couch.

'Well, patient,' he said, 'how are you? Come,' he continued, laying his hand upon Manton's forehead, 'pleasantly cool. No headache?'

'Oh no, sir; only so dreadfully weak.'

'We'll soon get over that. You shall have help. Two of the boys shall carry you, and we'll have you down in the garden every day.'

'Ah!' exclaimed Manton, flushing. 'When shall we begin?'

'This morning—almost directly. I'll go and see my other patient, and then have arrangements made, and easy-chairs placed under the big ceiba.' Then, nodding pleasantly, he strode toward the other room.

'Shan't find Renée supplying flowers there, shall I?' he thought. 'No: rubbish! Only an impulsive girl's desire to show kindness.'

'Well, patient,' he said, rather boisterously, as he entered Burns's room, to find that the lady in attendance was the black woman Semiramis—'well, patient, how are you?'

'Well, doctor, how am I?' said the young man, holding out his hand.

'Him berry bad, sah, and no get bit better,' said the woman volubly. 'Um no take notice what nurse say. Um do all as um like, and 'Miramis no use here 'tall a 'tall.'

'Oh yes, you are, old lady,' cried Burns; 'only you do want to coddle a man up rather too much.—I say, Captain Greville, it's very hard work lying here. When can you give me leave to go ashore—I mean, down below?'

'This morning,' said Greville, smiling.

'Then I shall be well in a week. I'm better already with the thoughts of it. But is old Manton coming too?'

'Yes: you shall both be carried down.'

'Here, 'Miramis, bring your stuff. I'll take it or anything else now.—Why, my dear host and doctor, this news is the best medicine I have swallowed yet.'

'I'm glad of it, my lad,' said Greville, smiling at the young man's light-hearted way.

'Thank ye; but, I say—you are too good to us: taking all this interest in a couple of strangers.'

'Oh no! not strangers,' said Greville, smiling. 'I have been a planter all these years; but I am still a sailor at heart, and your coming brought back the days when I was a frank young lieutenant like you, with plenty of the middies' berth clinging to me. I'm only too glad to welcome a couple of honourable English gentlemen to my house; so be quite at ease. My servants are yours for the time you are here. I only ask one favour of you.'

'Yes, sir. What is that?'

'Get well as soon as you can—not that I want you to go, but because I would rather have hale guests than sick.'

LA MALMAISON.

O'er all there hung a shadow and a fear;
A sense of mystery the spirit haunted.

VERY few tourists visit the dismantled Château and forsaken Park where, more than seventy years ago, the Empress Joséphine ended her eventful life, and where but a few years earlier Napoleon spent the only happy days of his restless existence. A few Americans annually cross the weed-covered court, a much larger number of Parisian *bourgeois* picnic-makers duly spend their summer Sunday afternoons in making merry over bread and wine on the mossy turf of the once well-trimmed lawns; but for the rest, the bats and the moles share the property with the speculative builder, whose myrmidons make the overhanging woods resound with hideous and discordant clamour of axe and hammer.

Guide-books rarely mention Malmaison. Even Murray and Baedeker each devote to it but a very small space, almost, one would think, as if by accident. For a few moments, then, and before the shadows of oblivion fall over the château, and while yet enough remains of the Park to make it still worth a pilgrimage, let us draw a picture of what it once was and what it now is.

The brightest days of Malmaison were between 1798 and 1810. In the former year the property was secured to Joséphine, wife of Napoleon Bonaparte, in her own right. Previous to this period, it had successively belonged to the Crown, and a private individual named Lécontenx, who had considerably enlarged the domain, and from whom it was purchased for one hundred and sixty thousand francs by Madame Bonaparte. It was destined to see the rise and fall of the great General, and played a more conspicuous part in his career than either St Cloud, Compiègne, Fontainebleau, or the Tuileries, all of which are more or less associated with his name. It was in the silence of the dark woods of Malmaison, far removed from court and courtiers, and so unsuggestive of either, that the greatest campaigns of Napoleon were planned. It was during his residence here that the Directory was overthrown and he became First Consul; and it was Malmaison that witnessed the sad scenes, when, from an unworthy ambition, the First Consul decided to annul the marriage with his faithful wife Joséphine, and to marry the almost child-wife, Maria Louisa of Austria.

The play-hours of the great Napoleon, few as they were, may be said to have been spent only at Malmaison. He was intensely fond of its retirement, and his tastes were singularly simple and home-like, when away from the grim work of conquest. Joséphine, as the wife of the First Consul, was not an accomplished scholar in the etiquette of that position, much less in that of an imperial court. She was no artist; she was no musician. Her usual occupation consisted of crewel-work for covering her furniture; and in this she enlisted the services of the ladies

who visited her. Napoleon—until persuaded by others that his wife was not capable of fulfilling the duties of Empress—was himself delighted with this simplicity. He would sit by the hour in her society in those long evenings at Malmaison, attracted, as were all others, by a sweetness and quiet dignity such as few women of the 'Directoire' period possessed. She was fond of and excelled in 'tric-trac' (backgammon), and Napoleon would often join in the play with her. 'While at Malmaison,' his secretary records, 'Napoleon was a veritable father in the midst of his family circle. His abnegation of grandeur, his simple and unaffected manner, and the gracious familiarity of Madame Bonaparte, formed an inexpressible charm. The Premier Consul would enjoy being read to, though he rarely read himself. The one thing to which he would never listen was poetry. "It is a poor science," said he.'

Joséphine's favourite employment—it was more than a diversion—was horticulture. She was not in any sense a scientist. She loved nature for Nature's sake, and her hot-houses and gardens were her long and lasting delight. In those days, such pleasures were costly; and more than once after her divorce, complaints were made that she overdrew her rather large annuity. Napoleon was himself liberal, but the State interfered, and on one occasion he was compelled to delegate a minister to warn her of the consequences of her horticultural extravagance.

The character of this beautiful woman was beyond all praise. Napoleon's excessive ambition was the main source of all the evils associated with his name. He was not vicious, like some of the kings of France in the two previous centuries. Joséphine had but to contend with an insatiable craze for power in her leonine husband. While in her presence, the Premier Consul was advised and directed by her, unconsciously to himself. But when away on his campaigns, his instincts prevailed. On one of his journeys to Italy, Joséphine showed her wisdom in not leaving him. She accompanied him through day and night stages the whole way, enduring with heroic patience and fortitude privations that only old soldiers were used to. Her whole life was one long sacrifice, one noble record of self-abnegation.

The years from 1810 to 1814 were sad and mournful. They were associated wholly with the enforced retirement of Joséphine, and ended with her premature death. From the moment that Napoleon quitted his noble wife, the tide of his prosperity began to ebb. Great victories were discounted by great disasters, until the failure of his Russian campaign compelled his abdication at Fontainebleau on the 4th of April 1814, exactly four years after his marriage with Maria Louisa. For ten months during his exile in Elba, France loses his figure; and again he is hailed as Emperor in the reign of the Hundred Days. On the disaster at Waterloo, he once more finds a refuge at Malmaison, wifeless and almost friendless. His faithful consort Joséphine, as constant when his divorced as when his acknowledged wife, had passed away just a year before this return. The Empress Maria Louisa had already gone back to her father's court at Vienna, a voluntary hostage of the Allies, where her affec-

tion for Napoleon, if she possessed any, was being rapidly transferred to a certain Count Nipperg, whosemorganatic wife she afterwards became. Her little son, 'le Roi de Rome,' subsequently 'Duc de Reichstadt,' had also been transferred to the care of his Austrian grandfather.

These last few days of Napoleon at Malmaison will ever remain the most marked in its history. Deeply attached to his step-children—the offspring of Joséphine by her first marriage—as much for their mother's sake as for their own intrinsic worth, he found in Hortense Beauharnais the only woman left to console him in the time of his trouble. She herself was fresh in her grief at the loss of her beloved mother; he, in turmoil of soul at the loss of everything—crown, power, and even the affections of the people. His one-time traitor, Fouché, had usurped authority, or obtained it by foul means, and had found his opportunity of revenge by refusing to publish a proclamation in the *Moniteur* which Napoleon had addressed to the army! Nemesis was indeed on his footsteps, her very shadow thrown over all. The promptitude which characterised the General's action in critical moments forsook him now; but Malmaison, hallowed by the sanctified memory of Joséphine, alone seemed to soothe his crushed and wounded spirit.

His secretary, Baron Minéval, records this period in these words: 'I see before me Malmaison, where had shone the aurora of his greatness, and which to him must have recalled the sweetest and bitterest of remembrances. I cannot approach this château without emotion: I again see him clothed with power, and crowned with an aureole of a great personal glory, passing the time in this delightful retreat, with charming society, the most amiable and the best of women—the embodiments of every grace; surrounded by the members of his family and some faithful servants, and partaking in their joys; seeking, among the rich foliage of the gardens and park, relaxation from work; or scattering broadcast the treasures of his fertile imagination in easy converse, sometimes serious, sometimes joyful, but always full of original and profound thoughts. He had a select table, but the salon was open to all. The venerable Archbishop was received with a deference due to his sacred calling, and treated with filial affection. Kings and princes came to salute his Imperial Majesty. The rupture of a union formed on mutual affection, and dissolved entirely through political reasons, had estranged Napoleon from Malmaison, which in days gone by had been the scene of confidences the most solemn and of affections the most pure, and had thrown him into a new theatre of pompous courts which left little but bitter chagrin. A premature death had taken away the Empress, who was so great an ornament, just at the moment when the crown had fallen from her consort's head. Napoleon returned to bid a last adieu to the tomb of his first—and the only—wife of his choice. He was received in his adversity by his adopted daughter, Queen Hortense, whose generous and filial care consoled his troubled days. I see before me the faithful courtiers prepared to run all chances of his misfortune even now for their illustrious chief. The Duke of Rovigo, energetic and devoted, whose personal adhesion to Napoleon had always

been so useful; General Bertrand and his wife, truest in adversity; Monsieur and Madame de Montholon, who, like General Bertrand, voluntarily shared in his exile; Gourgaud, chivalrous and imaginative; Las Cases and his little son; and Marchand, whose only recompense was the title he received of "friend of Napoleon."

On the 29th of June 1815, the Prussians closed round Argenteuil and Châton, the neighbouring villages to Reuil, near to which is situated Malmaison. Not a moment more could be left to chance. At half-past five in the evening General Becker presented himself before the ex-emperor: 'Sire, all is ready.' The great man replied not a word. He crossed the Hall into the Park, weeping. He bade adieu to all present. His beloved Hortense he tenderly embraced; then, with one last look at the château and all its surroundings, silently waved a last farewell. Alone he crossed the Park to a retired gate, where, entering a carriage, he directed his journey towards Rochefort, purposing from that seaport to take ship for the United States; but instead of this, sixteen days later he surrendered himself to Captain Maitland of the *Bellerophon*, claiming, as a last chance, the protection of British laws! A few days after, Malmaison was possessed by the allied armies.

The rest of its history is brief and decadent. On the Restoration, Prince Eugène, the brother of and on behalf of Queen Hortense, resold much of the Park and most of the pictures, while the remainder were sent to his seat at Munich, a few only of the relics finding their way to the museums of Versailles or the Louvre. In 1826 a Swedish banker bought the property, and held it until his death in 1842. It was then purchased by Maria Christina, and occupied by her for a short time upon her abdication of the Regency of Spain; and subsequently was sold by her to Napoleon III., who made it a sort of show-place until 1870. During the siege of Paris, the shells from Mont Valerien directed to the outposts of the German army encamped round Bongival, caused it some damage.

And what is left to-day to remind us of the past? Reuil is a large village, containing a handsome *mairie*, cavalry barracks, and numerous appendages to the army service. The village square encloses the church, with its tall and graceful spire, surmounted by an exceptionally long vane, on which Chanticleer, the winged symbol of Gaul, presides. In the church itself, built by Lacroix, by order of Napoleon III., is much to remind one of the Bonaparte family. Here is preserved, untouched by the hands of violence, all that was most prized by the last Emperor—the tomb of his mother Hortense, and of her mother the Empress Joséphine. The style of the church is mixed; externally not pleasing. The interior is better harmonised. On the right of the high altar is the tomb of Joséphine, the work of Gilet and Dubuc, and over it an exquisite statue by Cartélier. The Empress is represented kneeling. Beneath is the simple inscription, 'A JOSÉPHINE, EUGÈNE et HORTENSE, 1825.' At right angles with this tomb, and facing the nave, is that of the father of the Empress, the Count Tascher de la Pagerie; while opposite, and facing the tomb of Joséphine, on the left of the altar, is a monumental group

erected to the memory of Queen Hortense by her son, Louis Napoleon. It is the work of Bartolini. The Queen kneels on a cushion, her guardian angel hovering over her. Beneath is inscribed, 'LA REINE HORTENSE, son fils NAPOLEON III.' Below this group of statuary, and reached by a door and a flight of steps, is the actual tomb of Hortense, situated in a small chamber, and lit with a large bronze lamp. It is in beautiful preservation, only crumbling slightly in one or two places. We asked the old verger if any of the members of the family ever came to visit it and see to repairs. The answer was sadly given that they *could* not! The inscription on the tomb is a long one, and need not be here quoted, as it is but a list of titles and family history. Hortense Beauharnais was married on the 3d of March 1802 to Louis Napoleon, king of Holland, and died at his castle of Arenenberg, October 5, 1837. This made her also sister-in-law, as she was previously step-daughter, to Napoleon I.

But the church contains other remembrances. The bas-relief in bronze of Christ at the Tomb, removed from the little chapel of Malmaison, forms the façade of the high altar. And an oak-carved chair, presented by Louis Napoleon, on which is inscribed the number of the 'plébiscite' calling him from Republican to Imperial power—7,500,000.—But more artistically valuable and beautiful is the organ, a perfect piece of carving, on which appear these words in gold letters: 'Ouvrage du Sculpteur Florentin Baccio d'Agnolo, exécuté à la fin du XV^e S. pour l'église Sainte Marie Nouvelle de Florence, est un don de Napoleon III. (1863).'

The roads in the old quarters of the village are mostly lime avenues, the trees being generally trimmed in two sides of a square, so that the branches from either line of trees almost meet in the centre, and form a protection from sun and rain alike for the roadway, even more than the path. The same clear and distinct iron plates bearing the name of the avenue—or 'Boulevard,' as it is here written—are still affixed to the walls, as in the days of Louis Philippe, if not earlier. Taking a succession of these roads from the square, is reached one at right angles—the 'Avenue de la Malmaison,' in these October days resplendent in the richest tints of green and gold, for the trees on either side are planes, far more lovely in autumn than at any other period of the year. At the upper extremity and termination of the avenue are three gates: those to the left lead to private property; those in front to the Park only; while those on the right open directly on the 'cour d'honneur' of the château. The gates are fastened, and on a tattered poster affixed to a board, one reads: 'Adjudication en la Chambre de Notaire de Paris sise Place du Châtelet, par de Ministre M. Dufoure, l'un deux, le Mardi, 5 Juin 1888, à midi, du Château historique de la Malmaison,' &c. And then over the lower part of this condemnatory notice, which is by it half obliterated, is another: 'Le bureau de Ventes des Terraines de la Malmaison est dans le Château.'

Rattling the chains that held the rusting gates together, brought out on our visit a girl, not the neat little daughter of the *conciERGE* to a mansion, but the offspring of the broker's man, the man, in fact, in possession. She rather reluctantly un-

fastened the gates, assisted by that key which generally proves irresistible, and we crossed the weed-covered court. The château lies immediately in front, not where a similar building in England would have been placed, among the woods or more retired parts of the Park. A few straggling creepers hang over the walls of the garden adjoining; but not a leaf is found to cover the nakedness of the building itself, which, being architecturally unpicturesque, sorely stands in need of Nature's garb of green. By a side-door we entered. Desolation everywhere! Beyond a coverless billiard table, no furniture visible. The plaster falling from the ceiling, the few remaining oak panels half torn from the walls, and even the chapel outraged and in dismal ruins. On the upper floors, if anything, the state of things was worse. On the broken doors are written military orders, for during a period of five years subsequent to the war, the château was converted into barracks. The bedroom of Napoleon I. is a small apartment seventeen feet square. The view from it is not extensive, for the elevation is low, and surrounded by the well-timbered Park. One cedar of Lebanon stands guard on the lawn beneath the windows. Adjoining this room, and connected by an antechamber, is the bedroom of Joséphine. It is oval. The decorations have all, save the ceiling, vanished. There, in distemper, appear the remains of what was once a blue sky. The walls of the château are unusually free from the pencilled autographs of the great unknown, or the senseless comments of ignorant tourists; but here we found one and one only. It ran thus: 'Dieu permettez qu'un Napoleon vienne au plutôt restaurer cette maison que des . . . laissent tomber en ruine.'

We walked through the scores of tiny apartments, less even in dimension than those of the 'Triansons,' and, though the girl objected, we mounted to the topmost story, in the hope of obtaining a view over the Park. In this we were disappointed, for the windows were skylights, and only used by the bats. One of these little brethren we dislodged, and, as he seemed in a state of semi-torpor, placed him on a window ledge where the warm October sun might restore his vitality. There were scores of these little creatures suspended from the roof, and, from what we could see, they had not received a visitor for many a long day.

We descended to the Park, but were not allowed to enter the gardens, where the trees were mostly planted by Joséphine; for they have long since passed into private hands. That part of the estate as yet unabsorbed by the tasteless builder is still beautiful, and the 'Temple de l'Amour,' where Napoleon is said to have planned many of his campaigns, yet exists, and a tiny cascade in front of it ever musically falling into a pool beneath. There is still left sufficient to make a charming residence for some appreciative purchaser, who need not be excessively wealthy to maintain it.

But what is more delightful than the Park, are the overhanging woods, through which wind the greenest of green lanes. The beech-trees—far from common in Seine-et-Oise—are here growing in perfection; and oaks, conifers, birch and mountain-ash reach an unusual size. The

bridle-roads are deep in moss, over which trail the wild strawberry and bramble, whose leaves are as brilliant in decay as those of the Virginian creeper. The magpie screams as he settles on the highest branches of the elms; the large migratory locust and the dragon-flies flit over the green sward, and the grasshoppers chirp around one's feet. All else is silence—the silence of a dead and almost forgotten past!

NICKEL AND NICKEL-STEEL.

NICKEL has of late come into considerable prominence, not so much through its own intrinsic qualities, as through the alloy it is capable of forming with the important material, steel. Nickel-steel has for some little time past occupied the close attention of our most eminent metallurgists; and whilst already occupying a recognised position in applied science, both scientifically and commercially, bids fair to develop into considerable importance, and to provide all those engaged in constructional work of every class with a material of very superior strength, elasticity, and durability. In view of the importance attaching to nickel-steel, we now purpose laying before our readers some brief account of nickel itself; and then to conclude our remarks with some notice of the new alloy formed with steel.

So far back as 1751, nickel was discovered by Cronstedt, who, afterwards finding it largely in 'Kupfer-nickel,' gave it the name it now bears, Kupfer-nickel, or 'Goblin Copper,' being a term of contempt applied by miners to a certain class of copper ore which is 'tricky'—namely, promising, but not yielding copper. It is an interesting fact in connection with nickel that it is contained in the sun's atmosphere and is found in all meteoric iron.

Nickel ores are in general complex mixtures, being associated with one or more foreign metallic ores. Rich oxidised nickel ore was discovered in New Caledonia in 1875, and has since been imported into Europe in yearly increasing quantities. These deposits are free from arsenic, and find their way principally to France. Nickel is found in Canada around Lake Huron; and the Sudbury deposits, covering only thirteen thousand acres, are estimated to contain six hundred and fifty million tons of the ore; whilst Dr Bell, the Assistant-director of the Geological Survey of Canada, speaking of the Huronian belt, which stretches for more than six hundred miles east and west, gives it as his opinion that the search for nickel throughout that promising region is only in its infancy.

Turning now to the properties of nickel, we find it attracted by the magnet, and possessing specific gravities of 8·3 and 8·7 for ingot and forged metal respectively. Nickel can be welded at a red heat like wrought-iron, and does not tarnish even on long exposure to air; water has no action upon it and even such fumes as those of sulphuretted hydrogen fail to blacken it. A well-known alloy of nickel—German silver—is composed of three parts of copper to one part of zinc and one of nickel; whilst in the United States, in Belgium, and in Germany, an alloy of one part of nickel to three parts of copper is used for minor coins.

Passing now to consider the alloy made by nickel with steel, one of the first important properties obtained is that of non-corrodibility. It is well known that steel is more liable to rust than iron, such fact forming a drawback to its substitution for that metal; and the immunity from corrosion enjoyed by steels rich in nickel is a point of considerable interest; whilst even steel poor in nickel is found more proof against rust than that in whose composition nickel does not enter.

The superior strength obtainable from nickel-steel will readily suggest the advantages derivable from its employment: smaller scantlings and thinner plates can be employed; and saving in weight will add gracefulness and lightness to the structures under fabrication. Assuming the strength of iron at about twenty tons per square inch, and that of the ordinary mild steel of commerce at about thirty tons per square inch, there seems every indication that nickel-steel can be produced reliable and satisfactory in every respect with a strength of forty tons per square inch, or with additional strength as compared with mild steel and iron in the ratios of four to three, and two to one.

Already in the manufacture of armour-plates nickel-steel has made its mark, and sufficient has been said to demonstrate its superior qualifications for every class of work the engineer, be he civil or mechanical, or the architect may be called upon to design.

Into the question of cost it is foreign to our purpose to enter; but all experience has shown a gradual cheapening in price of production as a material becomes in demand; this and the discovery of new sources of nickel cannot fail to have a beneficial effect on this new alloy, which seems destined at no distant date to play an important part in the metallurgical world.

LAST YEAR'S LEAVES.

OVER sullen ribs of snow,
And the bitter, brown March grass,
As the eager east winds blow,
Before them as they pass,
In a swirl the dead leaves go.

Vagrant ghosts of last year's leaves
Hurried hither—hurried thither;
There were swallows in my eaves
When I watched them wane and wither,
And my fields were full of sheaves.

I have seen the uplands bare,
And the sleet i' the swallow's nest;
I have closed against Despair
The doorway of my breast,
With a hasp to hold him there.

But the sere leaves wander yet
From a year for ever fled,
Like the sleepless, vain regret
For the buried and the dead,
That my heart will *not* forget.

THE PRINCE'S PLUMES.

THE three traditional ostrich feathers which form the crest of the Prince of Wales, and the motto which invariably accompanies them, are more familiar to an Englishman than any other heraldic insignia, except it be the lion and unicorn supporting the arms of the sovereign, or the well-known dagger in London City shield.

The popular account of the adoption of the feathers by the eldest sons of the English kings as their own peculiar badge is, that the Black Prince, son of Edward III., conquered the original wearer of the crest, John of Luxembourg, king of Bohemia, at the field of Crécy, and ever afterwards wore the plumes in commemoration of the battle. 'The fate of the king of Bohemia,' says Hume, 'was remarkable. He was blind from age; but being resolved to hazard his person and set an example to others, he ordered the reins of his bridle to be tied on each side to two gentlemen of his train; and his dead body and those of his attendants were afterwards found among the slain, with their horses standing by them in that situation. It is said that the crest of the king of Bohemia was three ostrich feathers, and his motto, "Ich Dien," I serve, which the Prince of Wales and his successors adopted in memorial of the great victory.'

Modern research has played havoc with many a cherished legend, one after another of which have yielded to the critical examination of historical records. The general opinion now is that the badge, so far from being acquired on the battlefield, was adopted by the Black Prince and his successors as part of the armorial bearings of the various continental families with whom they were connected by descent. There is no contemporary evidence in support of the popular history of the badge, and the earliest writer who refers to it is Camden, whose *Remains* were published in the time of Elizabeth, more than two centuries after the battle. He says: 'The victorious Black Prince, his son, used sometimes one feather, sometimes three, in token of his speedy execu-

tion in all his services, as the posts in the Roman times were *pterophori*, and wore feathers to signify their flying post-haste. But the tradition is that he wore them at the battle of Poitiers, whereupon he adjoined this old English word, "Ic Den;" that is, I serve, according to that of the apostle, "the heir, while he is a child, differeth nothing from a servant." The learned antiquary even appears to be uncertain whether the battle he refers to was Crécy or Poitiers, for in the next edition of his work he says, 'he won them at the battle of Crécy from John, king of Bohemia.' It is also to be observed, unfortunately for the legend, that the crest of the Bohemian king was not a plume of ostrich feathers, but two wings of a vulture, '*semée*, of linden leaves of gold expanded.'

It is most probable that the badge was introduced into England by Philippa of Hainault, the consort of Edward III., and mother of the Black Prince. She was descended from the sister of Henry, Count of Luxembourg, an ancestor of John of Bohemia, whose connection with the legend is thus accounted for; and John's son, the Emperor Charles IV., bore an ostrich as his badge; as did his daughter Anne, the first queen of Richard II. The earliest reference to the ostrich feathers in any English record is in an indenture witnessing the delivery of certain articles of plate belonging to the wardrobe of Queen Philippa. Silver basins and ewers are described, enamelled with the arms of France and Hainault quarterly, and particular mention is made of a large dish for the alms of the queen. It was silver-gilt and enamelled on the bottom with a black escutcheon with ostrich feathers. The inference is that, like the arms of Hainault upon other articles of the plate, the ostrich feathers in the sable shield belonged to Queen Philippa, and were borne by her as a badge of her family, or in right of some territories governed by the Princes of her house.

The Black Prince refers to the feathers in his will dated the 7th of June 1376. He gave orders that his body should be buried in the cathedral

at Canterbury, and that twelve baton escutcheons should be placed around his tomb. Each was to be a foot high; in six of them should be 'our entire arms,' and ostrich feathers were to be placed in the others. He directed that upon each of the shields the word 'Houmont' should be placed; and it is very noticeable that the motto 'Ich Dien' does not occur in any part of the will. The Prince desired that an effigy of himself should be placed upon the tomb 'fully armed for war, with our arms quarterly, with our crest of the *Leopard* put under the head of the effigy.' He also ordered that his funeral procession through the streets of Canterbury should be preceded by 'two war-horses, covered with our arms; and two men armed in our arms and in our crests, the one for war, with our entire arms quarterly, and the other for peace, with our badge of the ostrich feathers with our banners of the same suite.' The fact that the Prince twice calls the feathers 'our badge' is peculiarly deserving of attention, and clearly shows that they were not used by him as an armorial ensign, but were wholly unconnected with war, and that the man who carried the feathers at the funeral represented the Prince as equipped for the amusement of the tournament, and not as arrayed in his full panoply of combat. Among various other bequests, the Prince left to the church at Canterbury his 'hangings of ostrich feathers of black tapestry, having a red border with swans for ladies' heads.' Although the Prince did not mention the motto 'Ich Dien' in his will, it is very clear that he sometimes used both it and the word 'Houmont' as an addition to his signature, for upon an extant warrant in the Prince's own hand both mottoes appear.

Rudely engraved representations of feathers appear upon two seals of the Black Prince, and upon one of his father; and the badge in different forms was borne by other sons of Edward III. John of Gaunt and his descendants all used the ostrich feathers; and his arms with three feathers enscrolled on a sable shield were placed in a window of St Paul's Cathedral; while his arms in the cloisters of Canterbury are also surrounded by the same badges. There is no evidence that the feathers were borne by Lionel, the second, or by Richard, the fourth son of Edward III.; but they undoubtedly were by Thomas of Woodstock, Duke of Gloucester, the youngest son, who used two badges, the feathers and the swan. So far from being confined to the sole use of the Princes of Wales, the feathers were occasionally granted to collateral branches of the Royal House. Richard II., who adopted the white hart as his own badge, granted two ostrich feathers to his cousin, Thomas Mowbray, Earl-marshal, and Duke of Norfolk.

The Princes of the rival Houses of Lancaster and York alike used the feathers. Henry IV. before his accession bore them in a remarkable manner. On each side of his shield is an ostrich feather with four small scrolls, the lowest having the letters so; the next, VE; the third, REY; and the last NE—forming together the word SOVEREYNE; and he continued their use when he came to the throne. One of the dishes at the coronation banquet of Henry VI. was a 'frytoun' garnished with a leopard's head and 'ij estryche

fidus.' The badge appears on the seal of Margaret Beaufort, Countess of Richmond, and mother of Henry VII. Edward, Duke of York, who was killed at the battle of Agincourt in 1415, bore both the feathers and the motto 'Ich Dien.' The seal of Edward V. as Prince of Wales represents the ostrich feathers in a singular manner. The Prince appears on horseback; the shield and the trappings of the horse are charged with three lions *passant*, and a single feather is fixed upon the horse's head; while the ground is bespangled with ostrich feathers and roses with the motto 'Ich Dien.' The horse-trappings of Richard III. were also decorated with the same badge. Henry VIII. bore the feathers as king; and from his time they have been used exclusively by the eldest sons of the reigning sovereigns. Edward VI., who never held the title of Prince of Wales, and was known until the death of his father as Prince Edward, simply bore a plume of feathers within a wreath of roses; and Henry, Prince of Wales, son of James I., sometimes bore the plume as it was used by his predecessors, and sometimes as it is seen at the present time. Since that period the feathers have been borne in the usual manner.

The less known motto 'Houmont' was originally of more importance than 'Ich Dien,' but in later times has been almost forgotten. It is probably founded on old German words variously written 'Hoogh moed,' 'Hoo moed,' or 'Hoogh me,' and is supposed to have related to the mental peculiarities of the first bearer.

There is thus strong reason for believing that the badge and both the mottoes have descended to their present possessors from the old House of Hainault, and that, instead of being trophies of successful war, they have been acquired peacefully by inheritance.

THE IVORY GATE.*

BY WALTER BESANT.

PROLOGUE (continued).

'WELL, mother?' he asked.

His mother sat down. She looked pale and wretched.

'Mother,' cried Hilda, the elder sister. 'Quick! What has happened? What does Mr Dering say?'

'He accuses nobody,' she replied in a hard dry voice. 'But'—

'But what?' asked Hilda.

'He told me everything—everything—and—and— Oh!' She burst into sobs and crying, though she despised women who cry. 'It is terrible—It is terrible—It is incredible. Yet, what can I think? What can any one think? Leave us, Hilda. Leave us, Elsie.' The two girls went out unwillingly. 'Oh! my son—how can I believe it? And yet—on the one hand, a boy of two-and-twenty exposed to all the temptations of town: on the other, an old clerk of fifty years' service and integrity. And when the facts are laid before you both—calmly and coldly—you fly into a rage and run away,

* Copyright 1892 in the United States of America by Harper & Brothers.

while Checkley calmly remains to await the inquiry.'

Mrs Arundel had been accustomed all her life to consider Mr Dering as the wisest of men. She felt instinctively that he regarded her son with suspicion: she heard all the facts: she jumped to the conclusion that he was a prodigal and a profligate: that he had fallen into evil ways, and spent money in riotous living: she concluded that he had committed these crimes in order to get more money for more skittles and oranges.

'Athelstan'—she laid her hand upon his arm, but did not dare to lift her eyes and behold that guilty face—'Athelstan—confess—make reparation so far as you can—confess—oh! my son—my son! You will be caught and tried and found guilty, and—oh! I cannot say it—through the notes which you have changed. They are all known and stopped.'

The boy's wrath was now changed to madness.

'You!' he cried. 'You? My own mother? You believe it, no? Oh! we are all going mad together. What? Then I am turned out of this house, as I am turned out of my place. I go, then—I go; and'—here he swore a mighty oath, as strong as anybody out of Spain can make them—'I will never—never come home again till you come yourself to beg forgiveness—you—my own mother!'

Outside, in the hall, his sisters stood, waiting and trembling.

'Athelstan,' cried the elder, 'what, in the name of Heaven, have you done?'

'Go, ask my mother. She will tell you. She knows, it seems, better than I know myself. I am driven away by my own mother. She says that I am guilty of—of—of forgery.'

'If she says so, Athelstan,' his sister replied, coldly, 'she must have her reasons. She would not drive you out of the house for nothing. Don't glare like that. Prove your innocence.'

'What? You, too? Oh! I am driven away by my sisters as well!'

'No, Athelstan—no,' cried Elsie, catching his hand. 'Not both your sisters.'

'My poor child;' he stooped and kissed her. 'They will make you believe what they believe. Good Heavens! They make haste to believe it; they are glad to believe it.'

'No—no. Don't go, Athelstan.' Elsie threw her arms about him. 'Stay, and show that they are wrong. Oh! you are innocent. I will never—never—never believe it.'

He kissed her again, and tore himself away. The street door slammed behind him: they heard his footsteps as he strode away. He had gone.

Then Elsie fell into loud weeping and wailing. But Hilda went to comfort her mother.

'Mother,' she said, 'did he really, really and truly do it?'

'What else can I believe? Either he did it or that old clerk. Where is he?'

'He is gone. He says he will come back when his innocence is proved. Mother, if he is innocent, why does he run away? It's foolish to say that it is because we believe it. I've said nothing except that you couldn't believe it without reasons. Innocent young men don't run away when they are charged with robbery. They stay and fight it out. Athelstan should have stayed.'

Later on, when they were both a little recovered, Hilda tried to consider the subject more calmly. She had not her mother's cleverness, but she was not without parts. The following remarks—made by a girl of eighteen—prove so much.

'Mother,' she said, 'perhaps it is better, so long as this suspicion rests upon him, that he should be away. We shall certainly know where he is: he will want money, and will write for it. If it should prove that somebody else did the thing, we can easily bring him back as a martyr—for my own part I should be so glad that I would willingly beg his pardon on my knees—and of course we could easily get him replaced in the office. If it is proved that he did do it—and that, you think, they will be certain to find out—Mr Dering, for your sake, will be ready to hush it up—perhaps we may get the notes back—he can't have used them all; in any case it will be a great comfort to feel that he is out of the way: a brother convicted—tried in open court—sentenced—oh!' She shuddered. 'We should never get over it: never, never! It would be a most dreadful thing for Elsie and me. As for his going away, if people ask why he is gone and where, we must invent something—we can easily make up a story—hint that he has been wild—there is no disgrace, happily, about a young man being wild—that is the only thing that reconciles one to the horrid selfishness of wild young men—and if, by going away in a pretended rage, Athelstan has really enabled us to escape a horrid scandal—why, mother, in that case—we may confess that the blow has been by Providence most mercifully softened for us—most mercifully. We ought to consider that, mother.'

'Yes, dear, yes. But he is gone. Athelstan is gone. And his future seems ruined. There is no hope for him. I can see no hope whatever. My dear, he was so promising. I thought that all the family influence would be his—we haven't got a single City solicitor in the whole family. I thought that he was so clever and so ambitious and so eager to get on and make money and be a credit to the family. Solicitors do sometimes—especially City solicitors—become so very, very rich; and now it is all gone and done—and nothing left to hope but the miserable wish that there should be no scandal.'

'It is indeed dreadful. But still—consider—no scandal. Mother, I think we should find out, if we can, something about his private life—how he has been living. He has been out a good deal of evenings lately. If there is any—any person—on whom he has been tempted to spend money—if he has been gambling—or betting, or any of the things that I read of—this young lady, thanks to the beneficent assistance of certain works of fiction, was tolerably acquainted with the ways of young men and their temptations—it would be a satisfaction to know it at least.'

The ladies of a family where there is a 'wild' young man do not generally find it easy to get at the facts of his wildness: these remain locked up in the bosoms of his companions. No details could be learned about any wildness—quite the contrary. He seemed, so far as could be learned, to have led a very quiet and regular life. 'But then,' said the philosopher of eighteen, quoting

from a novel, 'men shelter each other. They are all bad together.'

But—no scandal.

Everybody knows that kind of brother or sister by whom all family events are considered with a view to the scandal likely to be caused and the personal injury resulting to himself; or the envy that will follow and the personal advantage accruing from that event. That her brother was perhaps a shameful criminal might be considered by Hilda Arundel later on: at first, she was only capable of perceiving that this horrid fact, unless it could be hidden away and kept secret, might very materially injure herself.

Almost naturally, she folded her hands sweetly and laid her comely head a little on one side—it is an attitude of resignation which may be observed in certain pictures of saints and holy women. Hilda knew many little attitudes. Also, quite naturally, she glanced at a mirror on the wall and observed that her pose was one of sorrow borne with Christian resignation.

We must blame neither Hilda nor her mother. The case as put by Mr Dering in the form of plain fact without any comment, did seem very black indeed against Athelstan. In every family the first feeling in such a case—it is the instinct of self-preservation—is to hush up the thing if possible—to avoid a scandal.

Such a scandal as the prosecution of a brother for forgery—with a verdict of guilty—is a most truly horrible, deplorable, fatal thing. It takes the respectability out of a family perhaps at a critical moment, when the family is just assuming the robes of respectability: it ruins the chances of the girls: it blights the prospects of the boys: it drives away friends: it is a black spot which all the soaps ever advertised could never wash off. Therefore, while the mother hoped, first of all, that the boy would escape the clutch of the law, Hilda was, first of all, grateful that there would be no scandal. Mr Dering would not talk about it. The thing would not interfere with her own prospects. It was sad: it was miserable: but yet—no scandal. With what a deep, deep sigh of satisfaction did the young lady repeat that there would probably be no scandal!

As for Elsie, that child went about for many days with tearful eyes, red cheeks, and a swollen nose. She was rebellious and sharp with her mother. And to her sister she refused to speak. The days went on. They became weeks, months, years. Otherwise they would not have been days. Nothing at all was heard of Athelstan. He sent no letters to any one: he did not even write for money: they knew not where he was or what he was doing. He disappeared. It was understood that there had been wildness.

Now—which was very remarkable—though the forger had had a clear run of three weeks, it could not be discovered that any of the notes had been presented. Perhaps they were sent abroad: yet foreign and colonial banks would know the numbers of stopped notes. And towards the discovery of the forger no further step had been taken. The commissionaire who took the cheque had been, as you have seen, easily found: he said he should know the old gentleman who gave him the forged draft to cash. He said, being again interrogated, that

Checkley was not in the least like that old gentleman. What could be thought, then? Athelstan must have 'made up' as an old man: he was fond of private theatricals: he could make up very well: of course, he had made up. And then, this point being settled, they left off talking about the business.

Other things happened—important things—which made the memory of the prodigal son to wax dim. First of all came Hilda's case. She was a graceful young person, with features of great regularity: her expression was cold, her eyes were hard, and her lips were a little thin, but these things at nineteen are hardly perceived. She was that sort of girl who seems created for the express purpose, first of wearing and beautifying costly raiment, and next of sitting in a splendid vehicle. The finer the dress, the more beautiful she looked. The grander the carriage, the more queenly she seemed. In rags her coldness would be arctic, her hardness would be granitic: in silk and velvet she became a goddess. It was therefore most fitting that she should marry a rich man. Now, to be rich in these days, one must be old. It is the price that one has to pay for wealth. Sometimes one pays the price and gets old, and yet does not get what one has paid for. That seems hardly fair. There was a certain rich man, Mr Dering's younger brother, Sir Samuel Dering, Knight, one of the most substantial City men, a man who had a house in Kensington Palace Gardens, a yacht, a country place in Sussex, and piles of papers in a safe, meaning investments. He was a widower without encumbrance: he was fifty-seven years of age, not yet decayed: he wanted a wife to be the mistress of his house and to look well at his dinner-parties. Of course, when one does want a wife, at any age, one wants her young. Hilda Arundel, his brother's ward, looked as if she would discharge the duties required of the position admirably. He suggested the arrangement to his brother, who spoke about it.

There was a good deal of talking about it. Mrs Arundel showed that she knew the value of her daughter; but there was no doubt about the conclusion of the matter. There was a grand wedding, at which all the richer Arundels were present, and none of the poor relations. Mr Dering, the young lady's guardian, gave her away: Hilda became Lady Dering, and has been perfectly happy ever since. Elsie remained with her mother. Her brother was never spoken of between them. But she remembered him, and she was firm in her conviction that his innocence would be some day established.

After five years, nothing at all having been heard of the notes, Mr Dering made application to the Bank of England, and received from them the sum of £720 in new crisp notes in the place of those of which he had been robbed, so that the actual loss at 4 per cent. compound interest amounted to no more than £155, 19s. 9½d., which is more than one likes to lose, yet is not actually embarrassing to a man whose income is about ten thousand a year. He ceased to think about the business altogether, except as a disagreeable episode of his office.

Then Athelstan Arundel became completely forgotten. His old friends, the young men with whom he had played and sported, only remem-

bered him from time to time as a fellow who had come to some unknown grief, and had gone away. There is always some young fellow in every set of young fellows who gets into some scrape, and so leaves the circle, and is no more seen or heard of. We go on just the same without him: very seldom is such a man remembered long: it is the way of the world: we cannot stop to lament over the fallen: we must push on: others fall: close up the ranks: push on: Time drives: the memory of the fallen swiftly waxes dim.

Four years or so after the mysterious business of Edmund Gray, Mr Dering received a letter with an American stamp marked 'Private and Confidential.' He laid this aside until he had got through the business letters; then he opened it. He turned first to the signature. 'Ha!' he said, 'Athelstan Arundel. At last. Now we shall see. We shall see.'

He expected a full confession of the crime. We should never expect, says the Sage, what we desire, because we never obtain what we expect. It would have made Mr Dering more comfortable in his mind had the letter contained a confession. Of course Athelstan had done it. Nobody else could have done it. Yet when he thought about the business at all, there always arose in his mind an uneasy feeling that perhaps the boy had been treated unwisely. It might have been more prudent to have kept the facts from him, although they pointed so strongly in his direction, until proof positive was obtained. It might, again, have been better had the facts been put before him with a few words of confidence, even though that confidence did not exist. Time only strengthened Mr Dering's suspicions against the young man. The thing *must* have been done by Checkley or by him. Now, Checkley was not able, if he had wished, to imitate any handwriting. No! It was done by Athelstan. Why he did, what he got by it, seeing that those notes had never been presented, no one could explain. But he did it—he did it. That was certain.

Mr Dering therefore began to read the letter with interest. Its commencement was without any opening words of respect or friendliness. And it was not by any means the letter of a wicked man turning away from his wickedness. Not a word of repentance from beginning to end.

'Four years ago,' Mr Dering read, 'you drove me from your place and changed my whole life, by a suspicion—amounting to a charge—of the gravest kind. You assumed, without explanation or examination, that because certain facts seemed to point in a certain direction, I had been guilty of an enormous crime, that I had robbed my father's oldest friend, my mother's Trustee, my own guardian, my employer, of a great sum of money. You never asked yourself if this suspicion was justified by any conduct of mine—you jumped at it.'

'Quite wrong. Wilfully wrong,' said Mr Dering. 'I laid the facts before him. Nothing but the facts. I brought no charge.'

'I daresay that by this time the criminal has been long since detected. Had I remained, I would have brought the thing home to him. For of course it could be none other than your clerk. I have thought over the case thousands of times. The man who forged the cheque must

have been one of two—either your clerk—the man Checkley—or myself. It did not take you long, I apprehend, to learn the truth. You would discover it through the presentation of the notes.'—'This is a very crafty letter,' said Mr Dering; 'when he never presented any of the notes. Very crafty.' He resumed the letter.—'Enough said about that. I daresay, however, that I shall some day or other—before you are dead, I hope—return in order to receive some expression of sorrow from you if you can feel shame.'—'Certainly not,' said Mr Dering with decision. 'Meantime, there is a service which I must ask of you for the sake of my people. There is no one else whom I can ask. It is the reason of my writing this letter.'

'I came away with ten pounds—all I had in the world—in my pocket. Not seven hundred and twenty pounds, as you imagined or suspected. Ten pounds. With that slender capital I got across the Atlantic. I have now made twelve thousand pounds. I made it in a very short time by extraordinary good luck.' Mr Dering laid down the letter and considered. Twelve thousand pounds might be made—perhaps—by great good luck—with a start of seven hundred and twenty, but hardly with ten pounds. A silver reef—or more likely a gambling table, or a second crime, or a series of crimes. It will be observed that his opinion of the young man was now very bad indeed: otherwise, he would have reflected that as none of those notes had been presented, none of them had been used. Even if an English ten-pound note is converted into American dollars, the note comes home before ten years. 'Extraordinary good luck.' He read the words again, and shook his head. 'Now, I want you to take charge of this money, to say nothing at all about it, to keep the matter a profound secret, to invest it or put it in some place of safety, where confidential clerks with a taste for forgery cannot get at it, and to give it, on her twenty-first birthday, to my sister Elsie. Do not tell her or anybody from whom the money comes. Do not tell anybody that you have heard from me. When I came away, she was the only one of all my friends and people who declared that she believed in me. I now strip myself of my whole possessions in order to show this mark of my love and gratitude towards her. In sending you this money I go back to the ten pounds with which I started.'

Mr Dering laid the letter down. The words, somehow, seemed to ring true. Could the boy—after all?—He shook his head, and went on. 'You will give Elsie this money on her twenty-first birthday, to be settled on her for herself.'

ATHELSTAN ARUNDEL.

The letter was dated, but no address was given. The post-mark was Idaho, which, as we all know, belongs to a Western State.

He looked into the envelope. There fell out a paper, which was a draft on a well-known London Firm, payable to his order for twelve thousand and fifty pounds.

'This is very unbusiness-like,' said Mr Dering. 'He puts all this money into my hands, and vanishes. These are the ways he learns in America, I suppose. Puts the money blindly in my hands without giving me the means of com-

municating with him. Then he vanishes. How could he prove that it was a Trust? Well, if I could only think—but I cannot—the circumstantial evidence is too strong—that the boy was innocent—I should be very sorry for him. As for Elsie—she must be eighteen now—about eighteen—she will get this windfall in three years or so. It will be a wonderful lift for her. Perhaps it may make all the difference in her future! If I could only think that the boy was innocent—a clever lad, too—which makes his guilt more probable. But I can't—no—I can't. Either Checkley or that boy—and Checkley couldn't do it. He couldn't if he were to try. What did the boy do it for? And what did he do with the notes?

DREDGING FOR GOLD IN NEW ZEALAND.

At the antipodes one naturally expects to find things turned topsy-turvy. It will not, therefore, be matter of surprise to our readers to learn that in far New Zealand the gold-miner resorts to dredging the river-beds as one means of acquiring the precious metal. The search for gold is pursued in divers ways in the Britain of the South. The shallow patches of auriferous soil—whence the old-time digger with his shovel and 'cradle' was wont to obtain such fabulous results—are gradually becoming worked out. The richer quartz reefs, too, have long since been transformed into bullion by means of batteries and other agencies. Hydraulic and hand-sluicing are gradually stripping even the poorer alluvial drifts, and yielding a golden harvest to the bold speculator, and the more cautious Mongolian who follows in his wake.

Sagacious miners are now turning their attention to the great rivers of the South Island, and more especially of Otago, which have for untold centuries 'rolled down their golden sand' to the Pacific Ocean. The mighty Molyneux (or Clutha) and its tributaries seem destined to be the Pactolus of the far South. For years past, covetous eyes have been turned on their turbid waters, and schemes both daring and original have been devised for extracting the fabulous quantities of the precious metal assumed to be hidden beneath the rocky river-bed. Patient Chinamen working with most primitive appliances have managed to secure good returns from the margin of the streams when the water was low. Time and again, projects have been mooted for diverting the river from its usual channel, and thus laying bare the golden soil beneath. Small 'spoon-dredges' have been for many years used for working the river-bed where the water is shallow and the ground easily worked. But these are mere temporary expedients, and do not serve to 'prospect' the main stream of the deep and rapid Clutha. Within the last year or two, however, a number of larger dredges have been built, and are now working on the Clutha and its feeders—the Kawaren and the Shotover.

A visit to one of those larger dredges is both interesting and instructive. Some months since, the writer visited the Sew Hoy dredge, on the Shotover River. (The Celestial appellation of the dredge in question was given to it on account

of its projector being a speculative Chinaman of that name.) The scene was a peculiar one. Through a deep gully, bordered on either side by vast treeless mountains, meandered a small and muddy river, whose bed of flat shingle must have measured about half a mile in width. The stream itself occupied but a fraction of the old river-bed, and its course was tortuous and uncertain. On the edge of the stream, and towards the lower end of the shingle bed or 'beach,' lay a small steam hopper dredge puffing away busily, and apparently digging out shingle from the beach in front, and carefully replacing the same at its stern, where a heap of 'spoil' was plainly visible. On getting on board the dredge itself, however, it soon appeared that the work was not so objectless as it seemed on first sight. The dredge was moored to the river-banks by long wire cables, which kept the vessel in position, and enabled the buckets to eat their way into the bank of 'wash' in front of them. The ladder of the dredge raised or lowered the chain of buckets as required. As the buckets came up full they tipped their loads into a revolving screen or shoot, which separated the larger stones, &c., and conducted the payable wash-dirt on to a series of sloping sluice-boxes, down which a stream of water kept continually flowing from a pump on board the dredge. The wash-dirt was thus gradually reduced, and the gold then saved in the usual way by means of plates, 'ripples,' and cocoa-nut matting. The dredge is kept going day and night, the men working in three shifts of eight hours each. During the shift we were on board, the engineer was an Englishman, and the deck-hands—who looked after the sluice-boxes and moorings—were Chinamen. The duties of the latter were confined to the gold-saving portion of the process, and they had strict instructions not to interfere with the engines in any way. A young Celestial, however, anxious to display to us ignorant outsiders how easily the great machine was worked, took advantage of the engineer's momentary absence to turn one of the levers used for lowering the bucket-ladder. The result was alarming. The huge machine strained, groaned, creaked loudly once or twice, and finally ceased working. The engine had to be stopped forthwith; and when we left, the engineer was busily engaged trying to get the dredge once more into working order. Our phlegmatic Mongolian friend seemed more amused than alarmed at the unexpected result of his display of engineering skill. Very picturesque he looked in his slouch-hat, blue shirt, and long gum boots, as he waved farewell to us with a long iron rake from the deck of the silent dredge.

There are now about twenty dredges working on the Clutha and its tributaries alone. These are all hopper dredges; but their motive-power is derived from various sources. The earlier dredges built were of the paddle-wheel class, being worked by the strong current against which they hung at their moorings. It was soon found, however, that these 'current-wheel' dredges were unsuitable for all parts of the river except where the rush of water was strong and constant. Steam-power was accordingly called into requisition, and this in time enabled the eddies and side-waters of the mighty Clutha to be thoroughly prospected and worked. In the more remote districts, more-

over, fuel has been found so costly that electric machinery is now being introduced; and one of the claims lately taken up on the Shotover is economically and efficiently worked by a dredge driven by electric force generated from a water-race some miles from the river.

The auriferous sea-beaches of the southern part of Otago and the coast of Westland are also being dredged for gold, but by a different process. For hopper dredges of the ordinary centre-ladder type have been substituted dredges working on the suction principle with a large metal nozzle and powerful pumping gear. Several Welman dredges constructed on this principle are now at work on the beaches referred to with greater or less success. Space will not permit of a detailed description of the working of these Welman dredges. Suffice it to say that in their case, as in that of the river dredges, a very small percentage of gold in the large quantities of stuff put through is required to make the returns highly payable. In this connection it may be mentioned that from one small dredge working on the Clutha River near Roxburgh as many as one hundred and eighty ounces (say seven hundred pounds worth) of the precious metal have been obtained in a single week.

Dredging for gold in New Zealand is still in its infancy. Much yet remains to be done in the way of perfecting its various processes. Rome was not built in a day, nor have the ultimate or ideal methods of gold-dredging and subsequent gold-saving yet been attained to. The fact remains, however, that even with the somewhat crude dredging appliances at present in use, an appreciable increase is being made in the output of gold from the southern portion of the colony of New Zealand.

SUNSTRUCK.*

CHAPTER VII.

AN hour later, the two young men were seated in long lounge-chairs in the dense shade cast by a huge tree. On a table between them lay flowers and luscious fruits; while beneath the table lay blinking at them a huge Cuban blood-hound, as if keeping guard over his master's guests.

The house was hidden by the luxuriant foliage, and the only personage visible in the midst of the calm dreamy silence was Semiramis, the black nurse, who sat on a stool at a little distance, watching them from time to time, to see if her services were needed.

The silence was at last broken by Manton, who had been lying back with his eyes half closed, and who now said softly: 'Thank God!—Will, lad, I never thoroughly knew the delight of existence till now. Yes: we shall soon grow strong again.'

'Amen to it all, Jack,' replied Burns. 'I'm pounds better already.'

They relapsed into silence once more, and then Burns spoke, after drawing in a long deep breath: 'It's heavenly!'

Then he took a glass from the table, drank, and set it back.

'Have a drink, Jack.'

Manton slowly raised his glass and drank, gazing at the dog the while.

'Jack. What a brute of a dog.'

'Yes. Kept to hunt the runaways, I suppose.'

'How long have we been out here?'

'I don't know: about a couple of hours, I suppose; but time seems to have dropped away, and it is all delicious repose. That fevered agony seems something which never existed.'

'But it did. Two hours, eh?—I say.'

'Yes.'

'I'm nearly well; and as soon as you can start we shall have to go.'

'Go? Oh no. Captain Greville said we were to stay until the ship came back.'

'Yes, lad, he said so to me too; but we must be off almost at once.'

'Go?' said Manton so excitedly that the black woman started up.

'Massah want 'Miramis?'

'No, no, my good woman, no,' said Manton, with the impatience of an invalid.—'Now, then, why must we be off at once?'

'Because, lad, the captain told me this morning that he was glad to have a couple of honourable English gentlemen beneath his roof.'

'Well,' panted Manton, with a faint colour coming into his cheeks.

'No: it's ill, lad. I can't answer for you, though I may suspect; but as far as I am concerned, he has not got an honourable English gentleman beneath his roof.'

'Will!'

'But a thorough-paced scoundrel instead.'

'You are speaking in riddles,' said Manton hoarsely.

'Then I'll speak plain English. Look here, Jack: we have been thrown into the society of two sweet innocent girls who have led the most secluded of lives; and if there is such a thing as love, that's the disease I've taken badly. It's contagious, I believe, and if I give that complaint to one in whose company I am hospitably allowed to be, I shall have been the scoundrel I say.'

Manton drew a long deep breath.

'I think you are as bad as I am, my lad, from what I have seen; and if I am right, there can be only trouble. So we had better go while our shoes are good.'

'Yes,' said Manton excitedly, 'trouble. Two men who have always been like brothers growing ready to spring at each other's throats, while they are taking advantage of their host's kindness by bringing misery upon his home.'

'Sounds vain, doesn't it, to say so much?'

'It might in some cases, Will,' responded Manton, 'but I think not here. They are not accustomed to the ways of the world. Yes; we must go, and the sooner the better, I suppose.—Yes?—What is it, 'Miramis?'

'De young missie say may dey come and sit an' talk to de gemmen lil bit?'

'Yes,' said Manton eagerly.—'No. Our compliments, and we are still too weak and ill.'

'S, massah,' said the nurse, and she moved off.

'Jack, you brute,' said Burns, in a low angry voice, 'how could you have the heart to send such a message as that!'

'I want to be an honourable gentleman if I

can,' said Manton coldly. 'The ladies are indeed unused to the ways of the world.'

'No need to insult them if they are,' said Burns bitterly. 'Seems to me that the feud has begun.'

That evening Renée grew thoughtful and strange, and found herself furtively watching Josephine, blushing each time she realised that she was guilty of what she told herself was a meanness.

There was a change, too, in Josephine, who was singing about the house in a wild excited manner; but so sure as she caught Renée's eyes fixed upon her, her own contracted, the lines between the eyebrows grew more deeply marked while she returned a defiant angry stare, that brought the tears to Renée's lids, and made her turn away with a sigh so as to be alone and think.

Josephine sat at her window with her head resting upon her hand. One by one the lights had been extinguished about the house, till one only remained—that in Captain Greville's room, where he sat reading for a time before going to bed.

At last the light was extinguished in the captain's room; and as soon as all was dark there, the girl's hand dropped upon the sill, and she reached out a little, peering into the darkness, where little points of light glided here and there over the transparent purple of the shadowy night.

'My bootiful,' said a soft thick voice directly after in a whisper just beneath where the girl leaned out.

'Oh 'Miramis,' cried Josephine, in an eager whisper, 'I thought you would not come.'

'Den missie shouldn' tink such ting. Well, didn' 'Miramis say she make de hahnsume buckra officer quite well?'

'Yes, 'Miramis.'

'And um make lub to missie?'

'Yes—no—not much.'

'Ah? Wait lil bit, Missie Josee, and he lub her much as she like.'

'But sometimes I think he might love Renée instead,' said the girl faintly.

'Oh no,' said the woman with a low chuckle. 'He going lub Missie Josee. 'Miramis make lub-charm, and Missie Josee hab de lubber she like moce. Where Missie Josee hahn? Dat's um—now touch. What dat you touch?'

'Your necklace of bright-coloured seeds,' said the girl.

'Yes, missie. Ebery one got a charm in um—make young man tink 'bout de lady who want um. Missie Josee want um buckra Massah Manton marry her. He got to marry her—dat's all.'

'But suppose he doesn't care for me, 'Miramis.'

'Yes.—What suppose?'

'He were to love Renée instead,' whispered the girl, almost inaudibly.

'What? No: he goin' lub my lil darlin' Missie Josee, who always lub 'Miramis. She gib him ting make um grow strong an' well, all o' purpose for Missie. Massa Captain tink he go cure de hahsum sailor, but it all 'Miramis' doing. Whah Missie Josee's hahn?'

The girl leaned out again into the darkness, and there was a loud rustling and a sharp ejaculation.

'What's the matter?' whispered Josephine.

'Miramis slip an moce tumble down out ob de tree. Dah, kissie, kissie, kissie lubly hahn. Juss like Missie Josee moder's hahn. Good-night, darlin'! She shall hab de hahnsum buckra officer.—Good-night.'

Josephine let herself sink down upon the matting-covered floor and rested her burning face in her hands to think of John Manton and her newly-awakened love; while in her room on the other side of the passage, Renée was also awake, too unhappy to sleep, for the home which had once been so happy seemed now to be clouded over with trouble, and the future began to look very blank.

CHAPTER VIII.

'Nonsense, my lads. I stand to you both in the position of your captain, and I am answerable to him for the state in which he will find you when he returns.'

'Yes, Captain Greville,' said Manton, who acted as spokesman, one evening as they sat together after dinner, with the moths whirring round the shaded lamps, and the fireflies playing about like sparks over the bushes in the garden near the open window; 'but we have been here nearly a month; and Burns and I think that we ought not to trespass on your kindness any longer.'

'Humph!' said Greville. 'What do you think of doing, then?—putting to sea in an open boat?'

'Oh no, sir,' interposed Burns; 'it must be a month before the ship returns, perhaps two, and we have set our minds on making an exploring expedition through the island.'

'Rubbish!' said the captain tartly.—'Now, gentlemen, speaking as your host, I say I shall not let you go; and then as your medical man, I say it would be madness. Why, my good fellows, you are both as weak as ever you can be, and no more fit to go cutting your way through those forests than to fly. You would both be down with fever at the end of a couple of days. You must hug the shore, and hug it here in my garden. There is the boat.'

'Yes, Captain Greville, you are very good, and we are most grateful,' said Manton.

'Show it then, sir, by doing me justice when Captain Lance comes back.'

'But really, sir'—said Burns.

'There—there—there—my dear boys; light your cigars, and we'll have coffee.—What! you will not smoke? Very well: let's get into the drawing-room and have some music. Renée's harp has been almost silent since you two have been here; but the noise will do you good now.'

The young men glanced at each other as the captain rose.

He threw aside a thin drapery, and held it while the young men passed through into the drawing-room, where, dimly seen by the light of the shaded lamp, Renée and Josephine were seated some distance apart, the one reading, the other with work in her hand, which she hastily went on with as the gentlemen entered.

'Come, girls,' cried Greville. 'Your turn now to entertain. I'm going to smoke my cigar outside. Let's have a little music.—Sing me my old favourite, Josee.'

He stopped by the door while Renée crossed to the harp standing in one corner, and Josephine went to a canterbury and drew out a music-book. Then there was a little tuning; and both young men stood watching the round white arms, the one with its fingers busy among the strings, the other straining at the harp wrest.

This preparation finished, Renée played a short prelude; and Josephine's rich full voice rose and filled the room, thrilling her hearers as she sang with wonderful force and passion one of the fine old Irish ballads, full of love and promise of faith to the very end. And as she sang, her eyes were for a time half closed, the lids veiling their lustre till near the end, when she raised them and fixed them full upon Manton, who was watching and listening intently.

Burns saw the look pass between them, and his brow contracted as he noted that Manton seemed fascinated by the glowing eyes fixed upon his. Then he turned away, and saw that Renée's hands still rested on the harp, to whose silent strings her fingers seemed to cling, while her head drooped, and he could read misery and despair in every lineament of her face.

'Poor girl!' said Burns bitterly to himself as he crossed to her side and offered a chair.

'You are tired, Miss Greville,' he said.

'Tired? Oh no,' she replied gently.

'Well,' cried the captain 'from outside, 'what next? That's very good, but I want more.'

'Yes, you will sing again, Miss Maine?' said Manton, as the girl looked up at him with a timid appealing look, full of tenderness, one which plainly enough said: 'Shall I?'

'And you will play the accompaniment again, Miss Greville?' continued Manton, advancing towards the harpist.

Renée bowed her head and avoided his glance, turning to the music and selecting the ballad she knew from old habit her companion would prefer.

Manton drew back as he saw how plainly Renée avoided him. Burns stood leaning against the back of a chair, watching the little comedy being played; and directly after the chords of the harp vibrated through the room, Josephine took up the strain, and Manton listened from the couch, with his head resting upon his hand, seeing Burns advance to turn over the music on the stand of the harpist, and then involuntarily letting his eyes seek those of Josephine, who was singing, so it seemed, only to him, the words of the song sounding like the outpourings of her own heart.

He gazed at her once more, as if fascinated, listening, drinking in the music—the blending of voice and harp, which sounded so dreamy and delightful in his weak state, that his eyes grew dim, and the passionate look of the beautiful girl was robbed of half its power.

'Done?' came the voice of him who filled his thoughts. 'Then come out here, you young people. It is delicious. The moon is just rising.'

They all went out slowly in obedience to the captain's words, and Renée shrank back, to leave the room last with Burns; while Josephine, after throwing a light scarf about her head and neck, placed her hand upon Manton's arm.

'Ah, that's better,' said the captain as they

approached the spot where he was leaning back in a cane-seat. 'The most delicious night we have had for months. What a relief these times are after our hot days. But we must be careful.'

That night, after the captain and the two young men had retired to their rooms, there was an eager conversation going on beneath Josephine's window, where she was leaning out; while Renée had sought her room to throw herself upon her bed, weeping silently in the misery of spirit which had come upon her.

'Is that you, 'Miramis?' whispered Josephine as she reached out and peered down to gaze into the darkness.

'Yes, Missie Josee.'

'Miramis! Come closer—closer still, so that I can whisper.'

'Dah, missie, you reach down. You touch my ear an' speak right in um. You got somefin' good to say?'

'Yes,' panted the girl excitedly. 'He loves me, 'Miramis—he loves me!'

'Course. 'Miramis always tell Missie Josee so. She nurse and save de hahnsum officer buckra, Massa Manton, for Missie Josee. Missie Josee gib 'Miramis gold brooch now, and yaller hankchiff.'

'Yes—yes—yes!' cried Josephine excitedly. 'Now go. I want to shut my window and think.'

'When Missie Josee gib 'Miramis de brooch?'

'To-morrow.'

'An' de yaller hankchiff?'

'As soon as I can buy one.—Good-night—good-night.'

She drew back and closed the window, to take her right hand in her left and hold it to her lips as she stood in the half-light, the broad yellow moon sending its rays through the lattice panes and casting her shadow upon the wall.

'It was here he held it,' she whispered softly; 'and there—and there—and there.'

At each word she kissed her hand, her full red lips curling as she stood there afterwards smiling at her happy thoughts; and that smile was upon her lips as she lay down that night and slept.

CHAPTER IX.

How did it happen? Who can tell? How does it always happen that two who love are drawn together. Nature's magnetism must be to blame.

Days had passed since the night when Manton had listened to the singing, and an afternoon had come when he and his friend were in their old place down the garden.

Burns had dropped asleep after they had sat together for some time in silence, for a coolness had sprung up between the young men, one which a few words on either side spoken openly would have cleared away; but those words were not uttered, and the coolness threatened to be the beginning of a feud.

Weary of much sitting, Manton left his chair, and began to stroll down the garden toward where he could hear the voices of the black labourers in the plantation.

'Perhaps the captain's with them,' he thought, 'and I must see him alone and speak out frankly, for my position seems to be intolerable.'

He went on, and passed out of the garden to the beaten track which led through a patch of the primeval forest toward the negroes' cottages. The path was very secluded and winding, dark almost in the deep shade cast by the huge trees which the captain had religiously preserved for their grandeur; and Manton was slowly and dreamily wandering on, thinking out what he should say, when his heart suddenly began to beat rapidly, the blood flushed to his temples, and he stopped short to watch the slight graceful figure in white coming slowly toward him, her hat in one hand, a basket in the other, suggesting that she had been out upon some mission to the negroes' village. Her head was bent; and as Manton gazed eagerly at the beautiful face before him, he could see that it was troubled, for the tears were stealing down her cheeks.

For a moment he felt that his presence was an intrusion upon her sorrow; and he was about to hurry away; but his feet seemed nailed to the spot, and he stood firm till she was close up and became aware of his presence, starting violently, flushing up, and then turning deadly pale.

'Mr Manton!'

'Miss Greville—Renée,' he exclaimed hoarsely; and, carried away by the emotion within him, he caught her hands and held them firmly in spite of the violent efforts she made to snatch them away.

'Mr Manton!' she exclaimed, now flushing once more, and her eyes meeting his full of indignant fire—'loose my hands. What does this mean?'

'What I had hoped you saw and believed,' he cried in a low passionate voice: 'what I have tried hard to hide; what I have fought against all through these weary weeks of anxiety.—Renée, listen to me. Forgive me, if it is dishonourable to speak as I do, but the words will out now.—No, no—don't repulse me like this. The thought of you almost brought me back to life, for I love you—I love you as dearly as ever man could love.'

She looked at him wildly for a few moments, and then snatched her hands away.

'It is an insult!' she cried angrily.

'To offer the love of an honest man!' he said in a tone full of bitter reproach. 'Is this the gentle girl whose image I set up in my breast to worship! No, no—don't leave me like this, Renée. I am not worthy of you, but believe me all I say is true.'

She seemed to grow before him in her indignation, and for a few moments stood gazing at him with a look of withering contempt.

'Is this the gentleman to whom my father has done nothing but good—to whom we offered a kindly welcome in his time of need?'

'Miss Greville,' he cried excitedly, 'what have I said that you should turn upon me like this!'

'Returned evil for good. Given us deceit when we looked for frank manliness.'

'Renée, you are too cruel!' he cried.

'Cruel? How could I be harsh enough to the man who, after trifling and leading on one whom I look upon as a sister, dares to offer me what he calls his love!'

'I—trifle—lead on Josephine?' he cried indignantly. 'Never, so help me Heaven!'

She gazed at his flushed indignant face wildly, as he went on angrily now.

'Who dares say that? Oh, this is too much! Miss Greville—Renée—what have I ever said and done that you should think me so contemptible a cur?'

'Mr Manton!' she cried, with her voice trembling now, and her eyes gazed searchingly into his, 'I thought—my sister thought'—

'So little of me that you both supposed I would insult you and betray your father's confidence in so contemptible a way.'

'But Josephine'—

'Well,' he said coldly, 'Josephine?'

'She thinks that'—

'That I love her,' he cried bitterly. 'Surely she could not think this. I have never by word or look given her cause. I have never thought of her in connection with love. There is some terrible mistake. Miss Greville, Renée, you misjudge me, on my soul.'

'Is—is this the truth?' she faltered, her voice growing hoarse and agitated.

'Look at me and ask me that question again,' he said, catching her hand. 'Renée, from the first day I saw you, when weak almost unto death, you seemed to be the angel of hope beckoning me back to life. Indeed, indeed, it is true; and I have never given your sister more than a passing thought.—Don't withdraw your hand. Tell me you believe me. You cannot think I could be so base.'

'What can I think?' she faltered. 'Josephine believes so firmly that'—

She did not finish her sentence, for, as she spoke, he could read in her eyes that she had perfect faith now in all he said. Her sweet countenance had softened, and was irradiated now by a joy she could not hide; and as he drew her toward him, he felt that she was yielding softly, and that the misunderstanding was at an end, when all at once her face grew set, with a look of horror and dread. She shrank from him; and with a feeling of anger and shame that they should have been surprised, he turned round quickly to face Captain Greville, and ask pardon for suffering love to master duty toward his host.

But he was wrong. The captain was not standing behind him in the path, but Josephine, with her dark eyes dilated, her creamy cheeks flushed with scarlet, her head thrown back, and her lips parted in a smile which showed her white teeth.

'I am so sorry,' she said with a mocking laugh; and her voice had a metallic ring. 'I did not know you two were lovers. Shall I go away?'

'No,' said Manton, recovering himself, and holding out his hand as he met the girl's flashing eyes. 'Stay with us. Josephine—sister—I love Renée very dearly. You love her dearly too. Give me your hand.'

She fixed her eyes on his in a cruel vindictive stare, made no answer, but stood motionless for some moments before turning quickly and hurrying away.

Manton stood frowning for a few moments.

'Come,' he said, taking Renée's hand; 'there must be no further misunderstanding. Tell me, though: you believe me now?'

She could not answer; but he was satisfied with the look of faith and trust that beamed from her eyes; and they walked slowly back together

till they reached the garden, where Burns still lay back asleep. They stopped near him, and Manton felt a strange fresh dread arise within him as he asked himself whether he was to find an enemy in the sleeping man.

'I cannot help it,' he said half aloud. 'If he loves you too, what wonder? Renée, tell me all. Has Will here ever told you that he loved you?'

'Mr Burns?' she whispered eagerly. 'Oh no. Could you not see? He loves poor Josee, I am sure, and I always thought he was jealous of you.'

'He—Josephine,' cried Manton excitedly. 'Then it was about her! How blind I have been.—Here, Will: wake up!' And he laid his hand on the sleeper's shoulder.

Burns started up, to look wildly from one to the other.

'Congratulate me, old fellow,' cried Manton, taking Renée's hand as she stood flushed and tearful beside him. 'You and I have been playing at cross-purposes. Renée here has made me the happiest man under the sun.'

'Jack!' cried Burns wildly. 'I thought—I thought.—He stopped, looking deadly pale, and then flushing in his excitement.

'Yes; I know now what you thought. But it was all a mistake, lad. Renée'—

'Is my child, sir,' said a stern voice, 'and you are my guest, whom I trusted as a man of honour. I think some explanation is first due to me.'

It was given after dinner.

MEMORY IN ANIMALS.

ARROGATING the title of 'lord of creation,' man has been loth to recognise the claim of the lower animals to a mental status approaching that of himself. But the many objections formerly raised against this claim, objections mainly dictated by human vanity and unreasoning prejudice, have long been disposed of as baseless assumptions. Darwin, Lubbock, Lindsay, Romanes, and many others, have given ample proof that there is no fundamental difference in the mental faculties of man and the lower animals, the difference being simply one of degree and not of kind.

The possession of Memory by Animals forms one of the most important and interesting chapters in comparative psychology, and is one of the many facts establishing the claim of the lower animals to a common intelligence with ourselves. That animals profit by past experience is shown by the fact that they have retentive memories for; or vivid recollections of, past events, as well as of persons, places, and things. Darwin relates the case of a baboon at the Cape of Good Hope recognising with joy its owner who had been absent for nine months. In his *Descent of Man*, the great naturalist gives the following particulars of his own dog: 'I had a dog who was savage and averse to all strangers, and I purposely tried his memory after an absence of five years and two days. I went near the stable in which he lived, and shouted to him in my old manner: he showed no joy, but instantly followed me out walking, and obeyed me, exactly as if I had parted with him only half an hour before. A train of old associations, dormant during five years, had thus been instantaneously awakened in his mind.'

Professor Romanes cites the case of a dog remembering a certain sound after an interval of three years. 'I had a setter in the country, which one year I took up with me to town for a few months. While in town he was never allowed to go out without a collar, on which was engraved my address. A ring upon this collar made a clinking sound, and the setter soon learned to associate the approach of this sound with the prospect of a walk. Three years afterwards I again took this setter up to town. He remembered every nook and corner of my house in town, and also his way about the streets; and the first time I brought his collar, slightly clinking as before, he showed by his demonstrations of joy that he well remembered the sound with all its old associations, although he had not heard this sound for three years.'

Sir Andrew Smith once witnessed the following, and related the story to Darwin: 'At the Cape of Good Hope an officer had often planged a certain baboon; and the animal seeing him approaching one Sunday for parade, poured water into a hole and hastily made some thick mud, which he skilfully dashed over the officer as he passed by, to the amusement of many bystanders. For long afterwards the baboon rejoiced and triumphed whenever he saw his victim.'

Professor Romanes, for the purpose of obtaining material at first hand, obtained the loan of a monkey from the collection of the Zoological Society. From the first the monkey took a violently passionate attachment to him, and after keeping it for about three months, he returned it to the Zoological Gardens; and up to the time of the monkey's death it remembered him as well as the first day it was sent back. The following is Mr Romanes' statement in regard to the memory of this monkey:

'I visited the monkey-house about once a month, and whenever I approached his cage he saw me with astonishing quickness—indeed, generally before I saw him—and ran to the bars, through which he thrust both hands with every expression of joy. He did not, however, scream aloud; his mind seemed too much occupied by the cares of monkey society to admit of a vacancy large enough for such very intense emotion as he used to experience in the calmer life that he lived before. Being much struck with the extreme rapidity of his discernment whenever I approached the cage, however many other persons might be standing around, I purposely visited the monkey-house on Easter Monday, in order to see whether he would pick me out of the solid mass of people who fill the place on that day. Although I could only obtain a place three or four rows back from the cage, and although I made no sound wherewith to attract his attention, he saw me almost immediately, and with a sudden intelligent look of recognition ran across the cage to greet me. When I went away, he followed me, as he always did, to the extreme end of his cage, and stood there watching my departure as long as I remained in sight.'

There are many well-authenticated facts showing that the elephant has an exceedingly tenacious memory. Pliny wrote of this animal that in old age it could recognise men who were its drivers when young; and this is rendered highly

credible by the following instances, quoted by Mr Romanes, which came under the personal notice of Mr Corse. 'He saw an elephant which was carrying baggage take fright at the smell of a tiger, and run off. Eighteen months afterwards this elephant was recognised by its keepers among a herd of wild companions which had been captured and were confined in an enclosure. But when any one approached the animal he struck out with his trunk and seemed as fierce as any of the wild herd. An old hunter then mounted a tame elephant, went up to the feral one, seized his ear and ordered him to lie down. Immediately the force of old associations broke through all opposition; the word of command was obeyed, and the elephant while lying down gave a certain peculiar squeak which he had been known to utter in former days. The same author gives another and more interesting account of an elephant which, after having been for only two years tamed, ran wild for fifteen years, and on being then recaptured, remembered in all details the words of command.'

The memory of the horse is most marked. There are well-authenticated anecdotes in abundance showing that horses have spontaneously visited blacksmiths' shops when they required shoeing or when their shoes were uncomfortable. The horse's memory of roads and places is well known, and the following letter from the Rev. Rowland H. Wedgwood to Darwin is a good instance of this: 'I want to tell you of an instance of long memory in a horse. I have just driven my pony down from London here, and though she has not been here for eight years, she remembered her way quite well, and made a bolt for the stables where I used to keep her.'

The memory and keen observation exhibited by a horse belonging to Mr Romanes is both instructive and amusing. 'I myself had a horse which was very clever at slipping his halter after he knew that the coachman was in bed. He would then draw out the two sticks in the pipe of the oat-bin so as to let all the oats run down from the bin above upon the stable floor. Of course he must have observed that this was the manner in which the coachman obtained the oats, and desiring to obtain them, did what he had observed to be required. Similarly, on other occasions he used to turn the water-tap to obtain a drink, and pull the window cord to open the window on hot nights.'

The instances given of animals under the influence of alcohol form appropriate anecdotes at temperance lectures. Dr Lauder Lindsay relates that a dog, once drunk, ever afterwards refused the same kind of intoxicating liquor—beer. Its recollection of the disagreeable effects of drinking it even caused it to growl at the sight of a beer-pot. And Darwin relates how an American monkey after getting drunk on brandy would never touch it again; and thus, adds the great naturalist, was wiser than many men.

The parrot, too, possesses a strong memory. 'The bird,' says Dr Lindsay, 'not unfrequently takes a prominent and certainly intelligent part in the private worship of its master's household. Such parrots, for instance, make responses at the proper time—an exercise that implies a good deal more than mere memory, mere attention to the service. The behaviour, nay, the very speech,

the remarks and conversation of the bird, are suitable to place, time, and other circumstances. Thus, a certain English bishop's parrot is (or was) in the habit of saying—sometimes quite devoutly and with becoming solemnity, at other times sarcastically or ironically, but in either case at proper seasons and appropriately to the circumstances—"Let us pray." Of another we are told that it could sing in correct time and measure "There is a happy land."

The memory of bees is typical of most common insects. The following example, given by Huber, of its duration in bees is but one of a hundred, as readers of Sir John Lubbock's interesting experiments know. One autumn, Huber placed some honey in a window, which was visited by bees in large numbers. The honey was removed in the winter, and the shutters put up. When the shutters were taken down in the following spring, the honey was not replaced in the window, yet the bees, after an absence of many months, returned with the ostensible purpose of obtaining honey.

We cannot better conclude than by a reference to the memory of the ant. The remarkable intelligence of this little animal has excited the wonder and admiration of mankind. Darwin remarked that its brain 'is one of the most marvellous atoms of matter in the world, perhaps more so than the brain of man.'

To test the power of memory in the ant, Sir John Lubbock first tried keeping an ant away from its nest for more than a year and then restoring it. He found it was immediately recognised and caressed by its old friends and associates. He repeated this experiment a number of times, and with the same result. In order to deceive the ants in the nest, a foreigner was introduced in place of the one taken away; but the ants immediately detected the deception, and severely maltreated the intruder.

On the duration of memory in ants we have the following observation of Mr Belt, quoted by Mr Romanes: In June 1859 Mr Belt's garden was invaded by leaf-cutting ants. He found their nest about a hundred yards distant from his garden, and poured down their burrows a pint of common brown carbolic acid mixed with four buckets of water. 'The marauding parties were at once drawn off from the garden to meet the danger at home, and the whole formicarium was disorganised, the ants running up and down again in the utmost perplexity.' Next day Mr Belt found them busily employed bringing up the ant-food from the old burrows, and carrying it to newly-formed ones a few yards distant. These, however, turned out to be only intended as temporary repositories; for in a few days both the old and the new burrows were entirely deserted, so that Mr Belt supposed all the ants to have died. Subsequently, however, he found that they had migrated to a new site, about two hundred yards from the old one, and there established themselves in a new nest. Twelve months later the animals again invaded his garden, and again he treated them to a strong dose of carbolic acid. The ants, as on the previous occasion, were at once withdrawn from the garden; and two days afterwards he found 'all the survivors at work on one track that led directly to the old nest of the year before, where they were busily em-

ployed in making fresh excavations. Many were bringing along pieces of ant-food' from the nest most recently deluged with carbolic acid to that which had been similarly deluged a year before, and from which all the carbolic acid had long ago disappeared. 'Others carried the undeveloped white pupæ and larvæ. It was a wholesale and entire migration;' and the next day the nest down which he had poured the carbolic acid was entirely deserted. Mr Belt adds: 'I afterwards found that when much disturbed, and many of the ants destroyed, the survivors migrate to a new locality. I do not doubt that some of the leading minds in this formicarium recollected the nest of the year before and directed the migration to it.'

On the duration of memory in ants, Mr Romanes further quotes from a statement of Karl Vogt 'that for several successive years ants from a certain nest used to go through certain inhabited streets to a chemist's shop six hundred metres distant in order to obtain access to a vessel filled with syrup. As it cannot be supposed that this vessel was found in successive working seasons by as many successive accidents, it can only be concluded that the ants remembered the syrup store from season to season.'

THE PROFESSOR'S SKELETON.

THE Professor was a good man, a man of unimpeachable character and reputation—a man who had never been known to make a mistake, and also a man who was thoroughly aware of the fact. So much for himself. For his abilities—he knew his work, and how to do it; he likewise knew a good deal about other people's work, and, as far as he conveniently could, insisted upon its being done too. Without going into details, it will readily be understood that, though undoubtedly a useful man in his day and generation, the Professor was by no means a popular one; and it was over one of his latest interdicts that his wife and his step-daughter were conferring one rainy morning in the solitude of the best parlour.

'It is of no use whatever, my dear; he will not even discuss the question. I am very sorry for you; but I don't see any help for it.'

'You give way to him a good deal too much, mother. If he had one shadow of common-sense on his side, it would be another story. It's too late now to pass things over in that high-handed fashion.'

Mary Andrews spoke with some heat. Had she not good cause? Her first lover, unexceptionable in all respects, had appeared upon the scene; and without rhyme or reason, the Professor had put down his foot and refused to countenance any such proceeding.

'Why? why? In my day, young people did not presume to question the why and wherefore of their guardian's conduct; it ought to be sufficient for you that I have good reasons of my own, Mary,' he had told her when she tried to argue the matter.

'But it's not sufficient,' returned Mary. 'I'm too old to be treated that way, papa. If you have anything against him, you must tell me straight and plain.'

'Well, for one thing,' began the Professor, fairly driven to bay—'for one thing, his manner is objectionable. I dislike that light jesting style exceedingly. I believe him to be incorrigibly careless and superficial; and I do not speak without observation. Then he is wanting in the commonest courtesy of a gentleman; I caught him only the other day with a grossly caricatured representation of myself on his desk. You may think these trivial matters, my dear; but straws show the way the wind blows.'

The Professor had been edging towards the door as he spoke; with the last word, he vanished from the room. With all his learning, he was not altogether above such devices; and Mary quite understood that, and made up her mind to resume the discussion the very first opportunity: not so was the Professor to dispose of her views and feelings, whatever he might do with her mother's.

Discretion is said to be the better part of valour. Dr Dow did not appear again that day. Where or how he spent the time was a matter best known to himself; but for many days afterwards it was impossible to secure the smallest chance of an interview with him. Mary met her lover on the Park road one afternoon, and owned, with mingled wrath and irritation, that affairs were still as before. She had been able to accomplish nothing in the way of bringing the Professor to a more satisfactory state of mind.

'I am sorry to say it of any one connected with you, Mary,' remarked the young man gravely; 'but there is a good deal of stubbornness in your respected step-father's composition; he will neither be led nor driven. Shall we throw him overboard, and do without his kind permission?'

Mary shook her head despondently. 'We can't do that, John; it means mother too; besides, he has a kindly nature underneath.'

'Then he has a most unpleasant way of showing it on the surface,' was the rejoinder. 'I suppose you go off to your country quarters next week, and it will be rank heresy for me to show my face within twenty miles of the place. By the time you come back, it's hard to say what may have happened.'

'I may even have married into the band of professors myself,' said Mary demurely, 'and have an infallible guide of my own.'

'I'll qualify him for three months in hospital the first time I come across him,' was Mr Grierson's reply.

'Seriously, John, we can't very well help ourselves. You can write as often as you like; and the first chance I have of a solemn square up with the Professor, be sure I'll take it. But for that unlucky caricature, there might have been no trouble of any kind. Why did you risk it?'

'It was impossible to help it, Mary. If only you had seen him chasing round with that famous umbrella after some imaginary miscreant who had tampered with his papers—it was too good to be lost—not that I have not been sorry enough about it since,' he added in a graver tone.

It could not be undone now, and the pair had just to make the best of the position. For the next few days Dr Dow kept his household in a perfect whirlwind of preparation that effectually shut out all hope of private debate. On Sunday he raked up some acquaintance at the other side of the town, and spent the whole day there; and on Monday morning, provokingly triumphant, he stood on the front steps surveying the train of cabs waiting to convey his family and their belongings to the station, and keeping a vigilant outlook for possible shortcomings.

'Mary, my dear, if you would have some little regard for neatness. I never in my life saw such a disreputable portmanteau. What was your mother thinking of to allow it to go? Unless I look after everything myself'—

'Richard, did you notice if that roll of rugs was carried out?' interrupted Mrs Dow from behind.

'It was, my dear, and put into the second cab. I never yet met with a woman who knew where the wraps went, or if there were any at all. It takes a man'—

Mrs Dow did not wait to hear the rest, had probably heard it before. She went back into the dining-room, where a further consignment of packages was stacked upon the table, and began to strap up an overflowing bag.

'Now, mother,' said Mary warningly, 'that is not work for your fingers. Where is papa, that he can't?'—

'Hush! He's counting up the boxes. You know it takes a man'—

'Oh yes; I know all about that,' laughed Mary, finishing the refractory straps herself. 'Now, mother, we will just go and put ourselves into the first cab, and leave the "man" to wind up any way that pleases him.'

She swept her mother out of the chaos, past the energetic Professor—who was expounding the first principles of leverage to a sulky porter—into the roomiest cab, whence they looked out at the rest of the performance with rather malicious satisfaction on Mary's part.

It came to an end at last. The Professor, with his hands under his coat-tails, looking not at all unlike a dignified bantam cock, strutted round the various rooms, turned the key in the front door with his own hand, and descended the steps. One foot in the cab, he paused and looked searchingly at his wife. 'Isabella, where was my study coat packed?'—

'Oh dear,' cried Mrs Dow, stricken into dire confusion and consternation; 'I do believe it hasn't been packed at all; it's hanging up in that dark closet behind your study.'

'I knew it!' ejaculated her husband. The coat in question was a baggy venerable garment, of a nondescript greenish hue, but dear beyond price to the heart of its owner. The holiday would have been no holiday without it, and the whole establishment knew that very well; hence the Professor felt that here was solid ground for

a grievance at last. He waved the cabman aside and went back into the house.

'Take care of the matches, dear,' his wife cried after him.

Dr Dow stalked majestically in without vouchsafing a backward glance; he passed the dining-room door, his study door, and turned up a dim narrow passage; the closet door was at the end, a big dark cavern, that served as a general receptacle for lumber, and all the odds and ends of the household. The Professor tumbled over two trunks, and knocked his hat off against some sharp projection, before it occurred to him to dive into his coat-tail pocket for a match. Then he discovered that the unfriendly projection had been the gas bracket, and that the shock had knocked off the burner. No matter; it was only one more annoyance. He lighted the burnerless pipe and proceeded to look for his coat. There it was, not even decently hung up—just thrust out of sight and mind behind an empty crate. The Professor carried it out into the lobby and sorrowfully viewed the creases by the light of day.

'Papa!'—it was Mary's voice at the front door in a tone of indignant expostulation—'do you know we have only fifteen minutes left to get to the station? It's no use going at all if you don't come now—this minute!'

Dr Dow gathered up the maltreated coat under his arm. His papers, his umbrella—where were they? What way was this for a man to set off to his well-earned rest? In a fever of justifiable impatience at the utter unreasonableness of all things animate and inanimate on this particular morning, the Professor turned and locked the closet door—which had swung to of its own accord—and rushed once more into the street.

That was the last of the day's minor worries; nothing else went wrong. They did not miss the train or lose their luggage. The rescued coat was tenderly brushed, and folded up in the rack above. The sun shone out over browning fields and purpling heather; the anxious lines faded out of Mrs Dow's face; she moved up a little closer to her troublesome husband, and both looked as contented as though their days went by in one unbroken round of peace and concord. They meant to enjoy their holiday-time.

For the pair who were separated there was always one grand resource—the post. Mary wrote endless letters to her young lover; and neither of them appeared to be absolutely steeped in misery and despair, whatever they might choose to say on that head, and though that solemn 'squaring up' had come, and gone, and been of none effect.

'It is entirely for your own good, my dear,' said the learned man, looking at her quite pathetically. He had held his ground through all her arguments and entreaties. 'If I believed the young man to be worthy of you, no one would welcome him into the family more joyfully; but I have been unable—utterly unable to discover one redeeming point about him; and I should be failing, most miserably failing in my duty to you if, for the sake of present peace, I allowed you to sacrifice your future. Do not speak to me any more on this matter, my dear, I beg of you.'

Of course all this was faithfully reported to John, who as faithfully promised by return, to

do any doughty deed that might present itself in the rather limited round of daily existence. 'If he would hurl himself into the sea, I would be only too pleased to fish him out again; or if he wants a contribution to any pet charity, he has but to hint as much. I am ready to thrash any rival Professor within an inch of his life for him; but I must say it is a trifle hard on us both his sticking out in this fashion, when there's not the least likelihood of anything of the kind.'

Some days after the exodus from town, it chanced that the Professor had occasion to go back to attend a committee meeting. He was to return that same night. Nevertheless, Mrs Dow and Mary escorted him to the tiny railway station and surrounded him with little attentions, as if it were to be a lengthy parting; a state of things that the Professor thoroughly appreciated. He looked down upon them from the window of the railway carriage with quite a benignant expression.

'Richard, dear,' observed his wife, emboldened by it to a parting petition, 'the evenings are a little chilly; would you mind calling at the house and bringing my fur cloak back with you? It's hanging up in that dark closet.'

'Certainly, my dear,' he answered. 'You may depend upon me, though you would have left my coat in that same closet.'

Dr Dow reached town very comfortably, attended his meeting, and, after lunch, proceeded leisurely in the direction of his own house. Not very far from it, he unexpectedly and rather unwillingly came upon John Grierson. The young man was turning a corner sharply, and the pair almost came into collision. There was no loophole for pretending they had not observed each other; Mr Grierson at anyrate wanted no loophole; it was a chance not to be lightly lost.

'Ah, Dr Dow, I am lucky to have met you,' he said. 'I thought you were in the country.'

'So we are. A committee meeting brought me in for the day—that is all,' quickening his pace as he spoke.

Mr Grierson quickened his too. 'I wanted to tell you that I have got that appointment I mentioned; it will make a very comfortable addition to my income.'

'I am glad to hear it,' returned the Professor frigidly, walking up his own door-steps.—'I will bid you good-morning now, Mr Grierson; I have to look in here for a minute or two.'

'Then perhaps you will allow me to wait for you? I have several other things to speak to you about.'

Very reluctantly, the Professor gave way; he had the instincts of a gentleman, and could hardly decline as curtly at his own door as elsewhere. 'The house is *en deshabille*,' he said, opening the door with his latchkey; 'but if you like to wait here for a moment, I will not detain you longer. Leave the door open—it feels uncommonly close inside.'

It certainly did. John Grierson stood in the doorway, looking thoughtfully out at the passing cabs and omnibuses, and making up his mind that there should be no further begging the question by his proposed father-in-law. If fair means did not answer, he should be made to

understand in plain Saxon that they would do without him. At this point Mr Grierson suddenly became aware of smothered execrations and ejaculations from the regions behind.

'Hullo! is anything the matter?' he called out. 'Burglars—— Good gracious!' He had found his way to the little passage behind the study. Dr Dow was there, clutching at the door into the dark closet, from which a lurid light shone. The air from it was like a blast from a furnace; but the interior was like unto no furnace either of them had ever seen.

The gas had been burning in the closet since the day the family left town! The Professor had neglected to turn it off before he locked the closet door! And there it was, the smoking gas jet—without a burner—flaring away, as it had flared day and night since the house was shut up. How the house itself had escaped entire destruction was a mystery not to be explained. From wall and ceiling of the closet, from shelves and pegs and crates and garments, hung waving pendicles of soot. Every box and bundle was crusted with it, even to the boarded floor; and the luckless Professor stood gazing helplessly in at the havoc he had accomplished.

Mr Grierson gave vent to a prolonged whistle. 'Phew! if that's the plight your servants leave behind them, I'd make a clean sweep of them every one. Why, the place might have been burned down three times over.'

'It was I who left it,' gasped the convicted master, 'not the servants.'

'O-h!'

'I wouldn't have had it happen for ten—twenty—fifty pounds,' panted the Professor. 'I have always been so particular about anything of that kind, and now'—— He broke off with a groan that expressed more than words.

Mr Grierson made no comment; he did not feel called upon to express any sympathy—it was hardly to be expected of him. The Professor might be great in metaphysics, but in a practical emergency he was nowhere. As far as John Grierson could perceive, they were likely to spend the rest of the evening gazing at the sooty scene.

'You are going back by the six train, I suppose?' he remarked tentatively.

'How can I go back with a house like this?' demanded the Professor. 'I shall never hear the last of it. Look at Mrs Dow's cloak; I was to have taken it back with me.' He lifted the edge of the garment as he spoke—the fur-lining might have been composed of black fringe, for any colour that could be seen.

Mr Grierson shook his head discouragingly. 'I'm afraid Mrs Dow will never put that on again.'

'I never had a misfortune like this in my life before,' wailed her unhappy husband. 'I'd almost as soon the whole place had caught fire.'

Mr Grierson shook his head a second time. It was quite a refreshment of spirit to be able to look on reprovingly; he would not have missed the chance for a good deal, even if his own affairs had to stand over in consequence. All at once a sudden gleam of inspiration came upon him; some expression that was hardly compassion so much as self-interest swept across his complacent face; he dimly saw some beautiful possibility

of establishing a hold upon the immaculate Professor, and working it round to his own ends.

'How would it be if you were to say nothing at all about it?' he suggested cautiously. 'Get a charwoman in and have this mess cleared away? It's only soot, after all—there's no real damage done.'

The Professor grasped at the idea, like the proverbial drowning man at the straw. 'Could it be done?' he asked anxiously. 'There is that cloak too, only bought last winter.'

'Couldn't you get another like it?' insinuated the tempter. 'They're sure to have plenty more at the shop it came from; women's clothes are all cut after the same pattern.'

The Professor fell headlong into the trap; the downward path is fatally easy, once the first crooked step is taken. John Grierson promptly placed himself at the head of affairs, and the Professor was like clay in the hands of the potter. A charwoman was hunted up, brooms and brushes brought into full play, Dr Dow and Mr Grierson assisting till they might have passed for a pair of itinerant Christy Minstrels. The cloak was vigorously shaken out of the study window, and tied up in a clumsy paper parcel, ready for negotiating the change next morning. By ten o'clock that night the Professor's credit was saved; but his innocence was gone. For him, a grimy skeleton would haunt that closet through all time to come.

'Would it be possible to stop up that gas pipe, do you think?' he asked his accomplice, as they stood critically surveying the result of their labours. 'It doesn't look at all bad till you turn that light on; a person coming in with merely a candle would not notice any difference.'

Mr Grierson laughed. 'All right. We'll make assurance doubly sure. A plug of paper will keep that pipe off duty till it's convenient to put it on again.—Now we may as well look after some soap and water for ourselves; we have put in a fair night's work.'

Whatever John Grierson's failings might have been in the past, Dr Dow had no reason to complain of his doing things by halves on this occasion. He gave the finishing touches to everything, swept away all trace of the charwoman's presence, took upon himself the sole responsibility of the cloak transaction, and presented himself at the station the next morning in abundance of time to hand it in to the Professor's carriage and assure him that detection was impossible.

'I really do not know what to say to you, Mr Grierson,' said the Professor, uneasily arranging his parcels on the opposite seat. 'You have given yourself a good deal of trouble over this unfortunate accident. I am almost afraid I lost my balance slightly yesterday; but it is so seldom that anything of that kind has occurred, you can perhaps understand my unwillingness to have it generally talked about.'

'Don't think of it,' said Mr Grierson, with great politeness. 'Very few of us have contrived to get on so far without some kind of skeleton to hide away.—Good-bye; be sure and tell Mary I'll take a run over to see her on Saturday.'

And somehow—into the details of the process it is better not to inquire too closely—the Pro-

fessor brought himself to deliver the message verbatim. He knew now that that same skeleton would be a powerful lever in all coming arrangements.

Some years back—about the juvenile era of the present generation—it was the universal creed that no good action ever went unrewarded, no deed of darkness undiscovered and unpunished. Nevertheless, there have been many exceptions recorded. Dr Dow's skeleton is one of them: months of quiet dust have gathered undisturbed about it; no ruthless hand has let in the light of day, or gas, into the dark closet behind the study, and possibly Mrs John Grierson is the only outsider who has ever heard it whispered that there was any mystery connected with it. The nearest approach to discovery came with the Christmas bills; even gentle Mrs Dow was aghast at the length of the quarter's gas account. 'It is a perfect imposition,' she declared indignantly; 'we have not burned the half of it. I am most careful in seeing that it is never used unnecessarily. I don't know what the Professor will say when he sees it.'

But the Professor coming in just then, declined to interfere. It was better—much better, he said—speaking very feelingly—to be cheated than to cheat; and if there was any imposition in the matter, he preferred to leave it entirely to the conscience of the gas company.

It was curious that Mr Grierson took much the same view when he saw the bill. After that, Mrs Dow had no alternative but to pay it, though she did it under protest, and with a firm conviction of flagrant iniquity in high quarters.

W H Y ?

I WONDER why, six months ago,

When we two met to say good-bye,
And roses tossed their scented snow

To wooing winds that whispered nigh :

When sunlight fell in glittering showers

The blossom-laden boughs among,

And all the earth was bright with flowers,

And all the air was glad with song :

That, even though you bent and kissed

The tearful cloud upon my face,

I only saw a world of mist,

Which held no beauty and no grace !

I wonder why, now days are cold,

And no gay wing the coppice stirs ;

Now snow lies thickly o'er the wold,

And mournful winds are in the firs :

Nor sun, nor bird, nor flower I miss,

Because at the old place we stand

(There are no tears for you to kiss),

And once more whisper hand in hand :

That though the earth is wrapped in gloom,

And leaden clouds shut out the sky,

My world seems filled with light and bloom

And summer warmth—I wonder why !

CONCERNING EARTHQUAKES.

BY A LATE RESIDENT IN TOKYO, JAPAN.

EARTHQUAKES are popularly regarded as among the most terrible visitants that bring destruction on man.

The wild wind and the remorseless dash
Of billows

have probably destroyed more human life; but they can to a certain extent be eluded. The man who ventures not upon the deep has little to fear from the hurricane; but from the dire earthquake there is no escape. It comes and goes, mocking at our *terra firma*, and ruthlessly laying low our loftiest towers. The fiercest storm heralds its approach by goats' beards of cirrus cloud and a falling barometer. But the earthquake has no sure heralds; and the scientific man is baffled in all his attempts at prognostication. It is this mysteriousness, this apparent free-will, that add to the terror of its visitations.

Even in countries where earthquakes, though frequent, are rarely disastrous, there is an *uncanniness* which experience never lives down. Indeed, it is all the other way, as most residents in such countries can testify. Familiarity does not in this case breed contempt. The gentlest rumbling has been known to develop suddenly into a terrific shaking; and who knows but what this particular tremor may so develop? Anything is possible; everything is uncertain. We have met with some, it is true, who have claimed a prophetic instinct in the matter, who have maintained that they always felt peculiarly nervous an hour or two before an earthquake came. It is not a little curious, however, that no person of scientific training has ever claimed such foreknowledge. Further, it was always *after* the earthquake had come and gone that we heard such phrases as, 'I was sure an earthquake was coming;' or, 'That explains my nervousness to-day.' On one occasion, about two hours before quite a lively shake, one *soi-disant* prophet boldly

declared there would be no earthquake that night, because he lacked the peculiar sensations. Whatever may be claimed in the matter, however, one thing is certain—no person has ever warned a community of the approach of an earthquake; and till such a benefactor has arisen, earthquake visitations will be as wayward as human fancies themselves.

Science has nevertheless taught us much concerning our earth-shakings, especially during the last twenty or thirty years. More particularly has our knowledge of small earthquakes been considerably extended; while many old theories have been exploded, and some new ones have been advanced. And yet the grand problem of the origin of earthquakes remains essentially unsolved. There is no doubt, of course, that an earthquake must originate in an explosion, or a crack, or a disturbance of some kind, in the body of the earth. But what is the cause of the disturbance itself? Is it simply a loosening of rocks in the neighbourhood of cavities, or is it a chemical reaction, or a sudden evolution of steam caused by water coming into contact with molten rock? There are a great many facts that point to water and steam as important agents in the origin of earthquakes. One of the most suggestive of these is the contiguity of earthquake districts to the sea. Furthermore, earthquakes frequently have their origin just off the coast below the ocean bottom.

Now, if we consider the significance of a shoreline, we shall easily recognise the probability of neighbouring districts being seismically sensitive, as it might be termed. Seawards, the land slopes down till in some regions it is nine or ten miles lower in level than the heights that lie landwards. If the solid crust of the earth were to become fluid, it would at once flow down from its elevated parts until all became reduced to the same level. As it is, however, its rigidity sustains it; but none the less will there be a tendency, under the action of gravity, towards a general levelling. There must therefore exist in the intermediate districts lying near to the

shore-line a severe straining; so that the very irregularity of the land contour gives all the conditions favourable for the production of snaps and tremors in a material as intensely heterogeneous as we know the earth's crust to be. When such facts and possibilities are given their full weight, the surprise is not that there *are* earthquake districts here and there on the margins of continents, but that there are not more of them.

We have just pointed out that in the irregularity of distribution of the earth's solid matter we have a sufficient explanation of the existence of these seismically sensitive regions. But there is a very old theory of the cause of earthquakes which still has credence in some quarters, but which physically has not a leg to stand on. Error, indeed, always dies hard; and in this case not a few facts, real or supposed, seemed to find a ready enough explanation. For instance, the lava that streamed from volcanoes suggested oceans of molten rock many miles down below the earth's surface. The known increase of temperature as we descend into the earth's crust lent a powerful support to this view. Thereupon followed the theory that, just as the moon's gravitational action caused tides on the surface oceans of water, so would it produce tides in the subterranean ocean of lava. These bearing upon the lower surface of the crust would cause ruptures with tremors and earthquakes, or would find outlet by lava streams through volcanoes. Now, to establish this, it was obviously necessary to submit earthquake statistics to a severe examination, so that haply there might be discovered therein a periodic variation in frequency following some lunar periodicity. This was the problem which Professor Perrey of Dijon set himself to solve nearly fifty years ago. By an elaborate manipulation of statistics, he concluded that earthquakes were more frequent at new moon and full moon than at half-moon; more frequent at new moon than at full; more frequent when the moon was nearest the earth than when it was farthest away; more frequent at times of meridian passage of the moon than at other times. For the last twenty years these calculations by Perrey have been discredited for various reasons. His catalogue of earthquakes was far from complete, since it took no account of the innumerable small earthquakes of the kind that are almost hourly being registered by the delicate seismographs of to-day. Further, the differences in the frequencies on which he based his conclusions were all very small; and it is now generally admitted that, rationally interpreted, the statistics point to no excess of frequency at new moon, or at perigee, or at meridian passage. Very recently, M. De Ballore, a Swiss captain of artillery, has with much fuller statistics treated the last-named relation (if any) between earthquake frequency and lunar culminations. His conclusion is a negative one.

Now that we know more about the structure of the earth, we are not surprised that Perrey's supposed relations do not hold. G. H. Darwin's refined calculations have fully established Sir William Thomson's earlier conclusion, that our earth as a whole is as rigid as an equal-sized

globe of steel. This rigidity is quite inconsistent with the hypothesis of an ocean of lava spread out under a comparatively thin crust of solid material. The crust of the earth is a phrase still in common use; but it cannot now be taken as implying an under-stratum of molten rock. It simply means that part of the earth which is accessible to us. Of the deeper parts we know nothing definite, except that they are to a depth of several hundred miles at least essentially solid, being so kept, in spite of the high temperature, by the pressure of the superincumbent mass. Probably the structure of the earth is very heterogeneous, perhaps full of cavities containing semi-fluid material. It is quite possible, also, that tidal *strainings* may exist within the earth; but this is a very different thing from the subterranean tides whose assistance was invoked by the earlier seismologists.

Before passing to the discussion of other possible seismic influences, it will be well for us to consider some of the characteristics of earthquake motions. We do not refer so much to those terrible shakings which destroy towns, open chasms, and devastate a country. Terrible and heart-thrilling though these are, they are ill adapted for scientific study. Only very general ideas as to the nature of the motion can be obtained either from the recollection of the survivors of the catastrophe or from the character of the havoc wrought. Such a seemingly simple problem as the finding of the impulse that will level a wall is still far from being solved. At present, then, we rather refer to those small earthquakes which do little damage, but which can be recorded and even measured on suitable instruments.

An instrument for recording earthquakes is called a seismograph; an instrument for measuring them is called a seismometer. There are many kinds of the former class of instrument, all more or less useful in their way; but evidently the seismometer is a much higher grade of instrument, since it gives us the means of comparing the intensities of earthquakes occurring at different times. When, nearly twenty years ago, the Japanese government invited the aid of scientific men of other countries, it was fortunate in attracting to its shores some enthusiastic Britons, whose united labours led to the evolution of a trustworthy seismometer. Japan was one of the few countries where continually recurring earthquakes of small intensity could be studied with ease; and Professors Milne, Gray, and Ewing, building on the foundations of their predecessors in seismology, and working more or less independently, speedily devised instruments capable of giving continuous and complete records of earthquake motions. From these records the whole circumstances of the motions can be accurately worked out at leisure.

We do not purpose at this time to enter into a description of these seismometers. It is sufficient here to know that with such instruments motions amounting only to the five-hundredth part of an inch can be registered and measured. When the motion of the ground amounts, say, to half an inch, there is great risk of these delicate seismometers being thrown off their bearings. For larger earthquakes, therefore, less delicate seismometers must be constructed. A seis-

mological observatory should contain, indeed, a variety of instruments for recording the whole range of earth-shakings from the feeblest tremor up to earthquakes that fall just short of disaster. Observations, approaching more or less closely to this ideal state of equipment, exist in various parts of the world; and from their cumulated material we may hope in time to gather important information as to the distribution and relative frequency of earthquakes at different localities.

There is, so far, only one law of frequency that has unmistakably declared itself. It is usual to call it the annual periodicity; but, as will be shown immediately, seasonal periodicity is much the better name. Broadly stated, the fact is that in winter there are more earthquakes than in summer. For example, in Japan, the liveliest earthquake months are generally between January and May; while in Chili and in New Zealand, the maximum frequency occurs between June and September, that is, in their winter. In tropical districts like Java and Sumatra, there is no marked winter maximum, and we know that there is no marked winter. These facts are very instructive; and their significance was first fully discussed by Professor C. G. Knott in a paper on 'Earthquake Frequency' published in the Transactions of the Seismological Society of Japan.

Now, in inquiring into the possible causes of this seasonal periodicity, we must bear in mind that the sun is the great ruler of the seasons; consequently, we may possibly have to look to some solar phenomenon or effect, which, though timing with the seasons, may not be of necessity involved with them. For example, as the sun's distance from the earth changes from its smallest magnitude to its greatest in half a year, its tidal straining on the solid material of the earth passes from its maximum to its minimum. For the nearer the tide-producing body to the earth, the greater the tide or the tidal stress. The sun is nearest to the earth in December, so that if earthquake frequency should depend on this 'annual tide,' we should look for a maximum frequency in our winter.

We have no right to expect the effect to be contemporaneous with the imagined cause; for in many natural phenomena effects distinctly lag behind their causes. For example, our warmest summer weather is much later than the longest day when the sun attains his highest altitude. So in the case under discussion, a month or two may well elapse before the seismic influence of the maximum tidal stress can assert itself. Now, as already noticed, it is in winter that earthquakes do attain their maximum frequency. But it is in the *local* winter; and consequently we must abandon the suggested hypothesis. For, although in the northern hemisphere the maximum frequency does really occur when the sun is near its perigee, yet in the southern hemisphere the maximum frequency occurs when the sun is near its apogee.

It is evident, in fact, that we have to look to some influence depending upon what astronomers call the declination of the sun—that is, its position north or south of the equator. Now, the most obvious phenomenon attending the sun's march from solstice to solstice is, of course, the alterna-

tion of heat and cold. But a little consideration will show that this phenomenon can hardly have any direct influence upon the frequency of earthquakes. The annual variation of temperature at the earth's surface is not perceptible at a depth of fifty feet, while we are certain that the great majority of earthquakes originate in regions several miles below the surface. In addition to the broad temperature changes we have, further, the various climatic conditions as to rain, wind, storm-tracks, and atmospheric pressure. To what extent may we connect these periodic factors with earthquake frequency? Professor Milne has subjected the Japanese earthquakes to a searching analysis, grouping them under high barometer, low barometer, rising barometer, falling barometer, strong winds and calms, and so on; and in no case was he able to establish any relation. If such meteorological phenomena are to have any effect at all, it must, in short, be in virtue of their annual or long-period variations. As soon as the full significance of this statement is realised, we have not far to seek for a real cause. We may find it in the accumulation of snow over continental regions, adding to the pressure on the land. In this way the straining effect existing along the shore-line may be increased, so that the seismically sensitive region may yield most frequently during the winter months. Or we may find it in the great annual see-saw of barometric pressure over land and sea. In the warm summer weather the land surface becomes strongly heated as compared with the ocean surface. The result of this is that the atmospheric pressure over the ocean is somewhat greater on the average than the pressure over the land. As the winter comes on, the land surface cools until in temperate regions it becomes on the average colder than the sea. As a result, the atmospheric pressure over a continent becomes considerably greater than over the contiguous ocean. It should be noted that this see-saw of pressure is not perceptible in tropical regions, exactly where, as we have seen, there is no distinct seasonal periodicity in earthquakes. Here, then, we have a meteorological phenomenon with a seasonal periodicity of identically the same character as the annual variation in earthquake frequency. We do not mean that this winter accumulation of pressure over land areas causes earthquakes; but that, given the seismically sensitive region separating land and ocean areas, it may well be enough to accelerate the occurrence of those yieldings or snappings or explosions which are among the real origins of earth-shakings. In this sense we may regard snow accumulations and barometric gradients as real seismic factors.

These conclusions are based on statistical averages; and when we speak of a winter maximum of frequency we do not mean that the greatest earthquakes tend to occur in winter. Terrible disasters like that which visited the south shores of Japan in October of last year must be regulated—if we may use the expression—by conditions that depend wholly upon the internal structure of the earth. This earthquake was the most violent that had visited Japan for thirty-seven years. It was felt over the greater part of the main island; and, from the destruction caused to railways and telegraphs, it was some days before it was generally known how

terrible had been the shock in the populous provinces of Mino and Owari. This region lies about forty miles to the south-east of Kyoto. Here railway metals were twisted, river embankments destroyed, bridges broken, whole towns of houses and temples reduced to ruins, and thousands of inhabitants killed. In the neighbourhood of Gifu the configuration of mountain and valley has been changed completely; and it is believed that a large tract of inland country has been depressed below the sea-level. An important centre in the pottery industry was involved in the destruction; while the floods and fires that ensued added to the havoc wrought. For a week following the great shock thousands of smaller disturbances continued to occur. In Tokyo and Yokohama the shock was fortunately not felt as an excessive one. The motion of the ground was much greater than is usually experienced; but it was of a gentle swaying character, and was consequently unaccompanied by any serious damage to property. It may be mentioned that the region most heavily visited is not volcanic, and is much less subject to shakings than regions farther east—another instance of the hopelessness of any attempt to predict the approach of a disastrous earthquake.

THE IVORY GATE.*

By WALTER BESANT.

CHAPTER I.—UP THE RIVER.

‘CAN you not be content, George?’ asked the girl, sitting in the stern. ‘I think that I want nothing more than this. If we could only go on always, and always, and always, just like this.’ She had taken off her right-hand glove, and she was dipping her fingers into the cool waters of the river as the boat slowly drifted down stream. ‘Always like this,’ she repeated softly. ‘With you close to me—so that I could touch you if I wanted to—so that I could feel safe, you know—the sun behind us, warm and splendid, such a sweet and fragrant air about us, trees and gardens and fields and lanes on either side—and both of us always young, George, and—and nice to look at, and all the world before us.’

She, for one, was not only young and nice to look upon, but fair—very fair to look upon. Even young persons of her own sex, critics and specialists in the Art and Science of Beauty—rivals as well—had to confess that Elsie was rather pretty. I believe that few such critics ever go farther. She was, to begin with, of sufficient stature, in a time when dumpy women are not considered, and when height is a first necessity of comeliness: she paid, next, such obedience to the laws of figure as becomes the age of twenty, and is, with stature, rigorously demanded at this end of the century. Her chief points, perhaps, lay in her eyes, which were of a darker shade of blue than is common. They were soft, yet not languid; they were full of light; they were large, and yet they could be

quick. Her face was subject to sudden changes that made it like a spring-time sky of shower, rainbow, sunshine, and surprise. Her hair was of a very common brown, neither dark nor light. She was attired, this evening, in a simple gray frock of nun’s cloth with a bunch of white roses on her left shoulder.

When one says that her companion was a young man, nearly all is said, because the young men of the present day are surprisingly alike. Thousands of young men can be found like George Austin: they are all excellent fellows, of much higher principles, on some subjects, than their fathers before them; not remarkably intellectual, to judge by their school record: yet with intelligence and application enough to get through their examinations moderately: for the most part they do pass them with moderate success: they are not ambitious of obtaining any of the great prizes—which, indeed, they know to be out of their reach—but they always set before themselves and keep always well in sight the ideal suburban villa and the wife: they always work steadily, if not feverishly, with the view of securing these two blessings; they always hope to secure an income that will enable them to maintain that wife—with a possible following of babies—in silk attire (for Sundays); in ease as to household allowance; and in such freedom of general expenditure as may enable her to stand up among her neighbours in church without a blush.

The world is quite full of such men: they form the rank and file, the legionaries: their opinion on the subject of labour is purely Scriptural—namely, that it is a curse: they do not particularly love any kind of work: they would prefer, if they had the choice, to do nothing at all: when they get their summer holiday they do nothing all day long, with zeal: they give no more thought to their work than is sufficient for the bread-winning: whether they are professional men or trading men their view of professional work is solely that it brings in the money. If such a young man becomes a clerk, he never tries to learn any more after he has left school: he accepts the position: a clerk and a servant he is, a clerk and a servant he will remain. If he is engaged in trade he gives just so much attention to his business as will keep his connection together: that and no more: others may soar: others may become Universal Providers: for his part he is contented with his shop and his Sunday feast. If he becomes a professional man he learns no more of his science than is wanted every day. The lawyer passes his exam. and puts away his law-books; he knows enough for professional purposes: the doctor reads no more; he knows enough for the ordinary needs of the G. P.: the schoolmaster lays aside his books; scholarship and science interest him no longer; he has learned enough to teach his boys: the curate makes no farther research into the history and foundations of his church; he has learned enough. In a word, the average young man is without ambition; he is inclined to be lazy; he loves the present far more than the future—indeed, all his elders unite in letting him know that his own is quite the most enviable time of life; he likes to enjoy whatever he can afford, so that he very often eats up all his

* Copyright 1892 in the United States of America by Harper & Brothers.

wages : he does not read too much : he does not think too much : he does not vex his soul too much with the problems of life—greater problems or lesser problems—he accepts the teaching of his newspaper, and agrees with the words and the wisdom of yesterday's leading article : he accepts religion, politics, morals, social systems, constitutions, things present, past, and future, as if—which is perfectly true—he had nothing to do with them, and could not help it whatever was to happen. He never wants to alter anything : he believes that all British institutions are built on the solid rock and fashioned out of the hardest granite : any exceptions to this rule, he thinks, have come straight down from Heaven.

Observe, if you please, that this kind of young man confers the greatest possible benefits upon the country. He ought to be made a Baronet at least, if honours meant anything. His apparent sluggishness keeps us from the constant changes which trouble some nations : his apparent lack of ambition makes it easy for the restless spirits to rise : were the country full of aspiring young men we should be for ever having civil wars, revolutions, social upsydowns, new experiments, new religions, new governments, new divisions of property, every year. Again, it is this young man who by his steady attention to business, his readiness to work as much as is wanted, but no more ; his disregard of theories and speculations, his tenacity ; his honesty, his loyalty, his courage, and his stout heart, has built up the British name so that there has never been any name like unto it, nor ever will be again, for these solid and substantial virtues.

Being, then, just a young man of the time, George Austin was naturally like most young men in dress, in appearance, in language, and in manners. And had it not been for the strange experience which he was to undergo, he would have remained to this day just like other young men. He was better looking than most, having a good figure, a well-shaped head, and regular features, with eyes rather fuller of possibilities than falls to the lot of most young men. In short, a good-looking fellow, showing a capability for something or other in his firm mouth, ample cheek, strong chin, and resolute carriage. He would have made a fine soldier ; but perhaps an unsuccessful general, for want of that quality which in poets is called genius. In the same way he would in a lower walk keep a business together, but would fail to achieve a great fortune for lack of the same quality. As for his age, he was seven-and-twenty.

'Always like this,' the girl went on. 'Always floating down the stream under a summer sky. Always sweet looks and love and youth. It seems as if we could never be unhappy, never be worried, never want anything, on such an evening as this.' She turned and looked up the stream, on which lay the glory of the sinking sun—she sighed. 'It is good to come out on such an evening only to have a brief dream of what might be. When will the world give up their foolish quarrels, and join together to make the lives of all happy ?'

They had been talking, among other things, of socialism, all out of yesterday's leading article.

'When,' George replied, 'there is enough of good things to go round : when we invent a way to make all men ready to do their share as well as to devour it : when we find out how to make everybody contented with his share.'

Elsie shook her head, which was filled with vague ideas—the ideas of a restless and a doubting time. Then she went back to her original proposition. 'Always like this, George—and never to get tired of it. Time to stand still—nothing to change : never to get tired of it : never to want anything else. That is Heaven, I suppose.'

'We are on earth, Elsie,' said her lover. 'And on earth everything changes. If we were to go on drifting down the stream, we should get into trouble over the weir. To capsize would be a pretty interruption to your Heaven, wouldn't it ? And the sun will soon be setting and the river will get misty ; and the banks will grow ugly. But the chief thing is that we shall both grow old. And there is such a lot that we have got to do before we grow old.'

'Everything has to be done,' said Elsie. 'I suppose we have done nothing yet.'

'We have got to get married for the first thing, before we grow old.'

'Couldn't you love an old woman, George ?'

'Not so well, Elsie,' her lover replied, truthfully. 'At least, I think not.—And oh ! Elsie, whenever I do think of the future, my heart goes down into my boots. For the prospect grows darker and darker.'

Elsie sighed. She knew, already, too well, what was in his mind. Plenty of girls, in these days, know the familiar tale.

'Darker every day,' he repeated. 'They keep on crowding into the profession by multitudes, as if there was room for any number. They don't understand that what with the decay of the landed interest and of the country towns, and the cutting down of the costs, and the work that goes to accountants, there isn't half the business to do that there was. There don't seem any partnerships to be had for love or money, because the few people who have got a good thing have got no more than enough for themselves. It is no use for the young fellows to start by themselves ; so they have got to take whatever they can get, and they are glad to get even a hundred a year to begin with—and I am seven-and-twenty, Elsie, and I'm drawing two hundred pounds a year.'

'Patience, George ; something will turn up. You will find a partnership somewhere.'

'My child, you might as well tell Robinson Crusoe that a boiled leg of mutton with caper sauce is going to turn up on his desert island. We must not hope for the impossible. I ought to be grateful, I suppose, considering what other men are doing. I am planted in a good solid House. It won't run away, so long as the old man lives.'

'And after that ?'

'Well, Mr Dering is seventy-five. But he will not die yet, not for a long time to come. He is made of granite : he is never ill : he never takes a holiday : he works harder than any of his people ; and he keeps longer hours. To be sure, if he were to die without taking a partner—well

—in that case, there would be an end of everything, I suppose.—Elsie, here's the position.' She knew it already, too well—but it pleased them both to parade the facts as if they were something quite novel. 'Let us face it'—they were always facing it. 'I am Managing Clerk to Dering & Son—I get two hundred pounds a year—I have no prospect of anything better. I am bound all my life to be a servant. Elsie, it is not a brilliant prospect: I found out at school that it was best not to be too ambitious. But—a servant all my life—I confess that did not enter into my head. If I knew any other trade, I would cut the whole business. If there was any mortal thing in the whole world by which I could keep myself, I would try it. But there's nothing. I have but one trade. I can't write novels, or leading articles; I can't play on any instrument; I can't paint or act or sing or anything—I am only a solicitor—that's all. Only a solicitor who can't get on—a clerk, Elsie. No wonder her ladyship turns up her nose—a clerk.' He leaned his chin upon his hands and laughed the conventional laugh of the young man down on his luck.

'Poor George!' she sighed. In such a case there are only two words of consolation. One may say 'Poor George!' or one may say 'Patience!' There is nothing else to say. Elsie first tried one method and then the other, as a doctor tries first one remedy and then another when Nature sulks and refuses to get well.

'And,' he went on, piling up the misery, 'I am in love with the sweetest girl in the whole world—and she is in love with me!'

'Poor George!' she repeated with a smile. 'That is indeed a dreadful misfortune.'

'I am wasting your youth, Elsie, as well as my own.'

'If it is wasted for your sake, George, it is well spent. Some day, perhaps'—

'No—no—not some day—immediately—at once.' The young man changed colour and his eyes sparkled. It was not the first time that he had advanced this revolutionary proposal. 'Let prudence go to the'—

'Not there, George—oh! not there. To the winds, perhaps, or to that famous city of Palestine. But not there. Why, we might never get her back again—poor Prudence! And we shall be sure to want her all our lives—very badly. We will, if you please, ask her to go for a short voyage for the benefit of her health. We will give her six months' leave of absence: but we shall want her services again after her holiday—if you think we can do without her for so long.'

'For a whole twelvemonth, Elsie. Let us brave everything, get married at once, live in a garret, and have a splendid time—for a whole twelvemonth—on my two hundred pounds.'

'And am I to give up my painting?'

'Well, dear, you know you have not yet had a commission from anybody.'

'How can you say so, George? I have painted you—and my sister—and my mother—and your sisters. I am sure that no studio even of an R.A. could make a braver show of work. Well—I will give it up—until Prudence returns. Is it to be a garret? A real garret, with sloping walls, where you can only stand upright in the middle?'

'We call it a garret. It will take the form, I suppose, of a tiny house in a cheap quarter. It will have six rooms, a garden in front and a garden behind. The rent will be thirty pounds. For a whole twelvemonth it will be a real slice of Eden, Elsie, and you shall be Eve.'

Elsie laughed. 'It will be great fun. We will make the Eden last longer than a twelvemonth. I daresay I shall like it. Of course I shall have to do everything for myself. To clean the doorstep will be equivalent to taking exercise in the fresh air: to sweep the floors will be a kind of afternoon dance or a game of lawn-tennis: to wash up the cups and saucers will be only a change of amusement.—There is one thing, George—one thing'—she became very serious—'I suppose you never—did you ever witness the scouring of a frying-pan? I don't think I *could* do that. And did you ever see beefsteaks before they are cooked? They suggest the animal in the most terrible way. I don't really think I could handle those bleeding lumps.'

'You shan't touch a frying-pan, and we will have nothing roasted or fried. We will live on cold Australian beef eaten out of its native tin: the potatoes shall be boiled in their skins. And perhaps—I don't know—with two hundred pounds a year we could afford a servant—a very little one—just a girl warranted not to eat too much.'

'What shall we do when our clothes are worn out?'

'The little maid will make some more for you, I suppose. We certainly shall not be able to buy new things—not nice things, that is—and you must have nice things, mustn't you?'

'I do like things to be nice,' she replied, smoothing her dainty skirts with her dainty hand. 'George, where shall we find this house—formerly Eve's own country villa before she—resigned her tenancy, you know?'

'There are places in London where whole streets are filled with families living on a hundred and fifty pounds a year. Checkley—the chief's private clerk—lives in such a place: he told me so himself. He says there is nobody in his parish who has got a bigger income than himself: he's a little king among them because he gets four hundred pounds a year, besides what he has saved—which is enormous piles. Elsie, my dear, we must give up our present surroundings, and take up with gentility in its cheapest form.'

'Can we not go on living among our own friends?'

George shook his head wisely. 'Impossible. Friendship means equality of income. You can't live with people unless you do as they do. People of the same means naturally live together. Next door to Lady Dering is another rich Madam, not a clerk's wife. For my own part I shall sell my dress clothes for what they will fetch—you can exchange your evening things for morning things. That won't matter much. Who cares where we live, or how we live, so that we live together? What do you say, Elsie dear?'

'The garret I don't mind—nor the doorsteps—and since you see your way out of the difficulty of the frying-pan'—

'You will be of age next week, when you can please yourself.'

'Hilda gives me no peace or rest. She says that there can be no happiness without money. She has persuaded my mother that I am going to certain starvation. She promises the most splendid establishment if I will only be guided by her.'

'And marry a man fifty years older than yourself with one foot already well in'—

'She says she has always been perfectly happy. —Well, George, you know all that. Next Wednesday, which is my birthday, I am to have a grand talk with my guardian. My mother hopes that he will bring me to my senses. Hilda says that she trusts entirely to Mr Dering's good sense. I shall arm myself with all my obstinacy. Perhaps, George—who knows?—I may persuade him to advance your salary.'

'No, Elsie. Not even you would persuade Mr Dering to give a managing clerk more than two hundred pounds a year. But arm yourself with all you have got—don't forget any piece of that armour, child. The breastplate—there was a poor damsel once who forgot that and was caught by an appeal to her heart—nor the helmet—another poor damsel was once caught by an appeal to her reason after forgetting the helmet. The shield, of course, you will not forget—and for weapons, my dear, take your sweet eyes and your lovely face and your winning voice—and I swear that you will subdue even Mr Dering himself—that hardened old parchment.'

This was the kind of talk which these lovers held together whenever they met. George was poor—the son of a clergyman, whose power of advancing him ceased when he had paid the fees for admission. He was only a clerk, and he saw no chance of being anything else but a clerk. Elsie could bring nothing to the family nest, unless her mother made her an allowance. Of this there could be no hope. The engagement was considered deplorable: marriage, under the circumstances, simple madness. And Hilda had done so well for herself, and could do so much for a sister so pretty, so bright as Elsie! Oh! she was throwing away all her chances. Did one ever hear of anything so lamentable? No regard for the family: no ambition: no sense of what a girl owes to herself: no recognition or gratitude for the gift of good looks—as if beauty was given for the mere purpose of pleasing a penniless lover! And to go and throw herself away upon a twopenny lawyer's clerk!

'George,' she said seriously, 'I have thought it all out. If you really mean it—if you really can face poverty—mind—it is harder—much—for a man than for a woman'—

'I can face everything—with you, Elsie,' replied the lover. Would he have been a lover worth having if he had not made that answer? And, indeed, he meant it, as every lover should.

'Then—George—what in the whole world is there for me unless I can make my dear boy happy? I will marry you as soon as you please, rich or poor, for better for worse—whatever they may say at home.—Will that do for you, George?'

Since man is so constituted that his happiness wholly depends upon the devotion of a woman,

I believe that no dear boy ever had a better chance of happiness than George Austin—only a managing clerk—with his Elsie. And so this history begins where many end, with an engagement.

THE MONUMENT.

To the Londoner there is only one monument in the world—The Monument. And now that an agitation has been set on foot for its demolition or removal to the Victoria Embankment, we may be sure that a good deal of feeling will be exhibited on the part of the public who are partial to the ancient glories and landmarks of the City. The Monument, as is well known, was erected to commemorate the extinction of the Great Fire of London; and while its erection was not untinctured by partisanship, it still remains a very interesting memorial of a state of public feeling that, we hope, is now less and less manifested.

The summer of 1666 had been excessively dry, and the wood and plaster houses of old London were consequently in a ripe condition for burning, when the fire which proved so disastrous broke out. Every effort was made to prevent the spread of the flames, and everybody lent what aid he could in rescuing life and property. Even the king seemed to think seriously of the matter, and indeed a contemporary writer informs us that he took great pains—'no less than if he had been a poor labourer'—and 'strecht forth his own royal hands to assist in the putting out of those aspiring flames, which seemed to expect a princely extinguisher.'

There is no need to dwell upon the extent of the ravages of this dreadful conflagration, for that is well known to all; it will be sufficient to say that the City rose from its ashes, an improvement perhaps upon the old one, but not by any means so great a one as might have been made, had Wren's plans for rebuilding it been accepted and carried out.

In order to 'preserve the memory of this dreadful visitation,' an Act of Parliament was passed enacting that a column or pillar of brass or stone should be erected on or near unto the spot where the fire broke out, in perpetual remembrance thereof, and that such inscriptions as the Mayor and Court of Aldermen might direct should be engraved thereon. Sir Christopher Wren was appointed to design and carry out the erection of the column. For this purpose he drew up several designs, notably one with sculptured flames of gilt bronze issuing from the loopholes lighting the staircase; and a phoenix, also of gilt bronze, upon the summit. It was found, however, that this design would prove too costly; and, moreover, the resistance which the outspread wings of such an ornament would offer to the wind would have rendered it somewhat unsafe. The great architect then suggested a statue of Charles II., twelve or fifteen feet high, which in brass would have cost one thousand pounds. Such a finishing would, he thought, 'be more valuable in the eyes of foreigners and strangers,' and worthy of the greatness of the pillar. This was submitted to His Majesty, who, although he did not dislike the idea of a statue, was of opinion that a large ball of metal would

be more ornamental at a distance. Next to a statue, this seemed the most suitable thing that could be placed upon the column, 'by reason of the good appearance at distance, and because one may goe up into it and upon occasion use it for fireworks.'

The work of erecting the Monument was accordingly commenced in 1671, the site chosen being that upon which the church of St Margaret, New Fish Street, had stood before the fire, and was exactly two hundred and two feet—the height of the column—from the spot where the fire broke out.

The Rev. Samuel Rolle, whose meditations upon the fire and its results are well known, found food for reflection not only in the site selected for the Monument, but also in the materials of which it was proposed to construct it. Nothing, he thought, is more emblematical of fire than burnished brass; and moreover, if the City, as it was alleged, met its destruction by 'the treachery of the Papists,' no metal could be more appropriate as showing that they had sinned with a brow of brass. If, on the other hand, stone were used, that would be a lasting emblem of the hardness of their hearts in burning such a city and bringing thousands of families to ruin. It was his opinion that a memorial should have been placed where the fire ended, to mark the termination of the citizens' sufferings, rather than where it now stands. In this opinion he had the support of Evelyn, who would like to have seen in addition 'a plain lugubrious marble' placed where it broke out.

As is generally known, the substance chosen was stone; and the column was completed in 1677, the work having proceeded somewhat slowly on account of the difficulty of obtaining stone of sufficient size and quantity. To remedy this, a proclamation was issued forbidding the transport of stone from the Isle of Portland 'without leave and warrant first obteyned from Dr Christopher Wren, surveyor of our works.' Altogether, 28,196 cubic feet were used in the construction of the Monument, which is a fluted Doric column, 202 feet high; the body of the shaft is fifteen feet in diameter, and stands upon a pedestal forty feet high and twenty-one square. Upon the summit is a blazing urn of gilt brass, supported by a cone thirty-two feet high, around which is an iron balcony. Upon the north side of the pedestal is graven a lengthy legend in Latin, which describes the extent of the damage done by the fire, and formerly ended in this manner: 'But the Papistical malice which perpetrated such mischiefs is not yet restrained.' This last line formed no part of the original inscription, but was added, by order of the Court of Aldermen, in 1681, at which time rumours of the Popish Plot were disturbing men's peace of mind, and exciting in them horror and hatred of the Papists in an extreme degree. In 1685, however, this line was erased, only to be cut still deeper four years later. Once more, and for ever, it was obliterated in January 1831 by Act of Common Council. In the same manner was treated the following inscription, which was engraved around the base of the pillar, beginning on the western side: 'This Pillar was set up in perpetual remembrance of that most dreadful burning of this Protestant City, begun and carried on by the

treachery and malice of the Popish faction in the beginning of Septem. in the year of our Lord 1666, in order to the carrying on their horrid plott for extirpating the Protestant religion and old English liberty, and the introducing Popery and slavery.'

It was the recutting of these offensive inscriptions that inspired Pope with the well-known lines:

Where London's column pointing at the skies,
Like a tall bully lifts the head and lies.

Upon the south face is another legend, also in Latin, and somewhat lengthy, which informs us of the measures which were taken for the restoration of the City in the best possible manner, such as widening and levelling streets, rebuilding churches, bridges, and gates. The east side records the names of the Lord Mayors in whose years of office the column was begun, continued, and completed.

A most interesting feature of the Monument is the allegorical picture upon the front or west side. It was sculptured by Gabriel Cibber, father of the famous actor and poet-laureate, and represents the City—in the form of a female figure—wearing a most unhappy look. Time is trying to raise her, while Providence bids her look towards a cloud upon which are seated figures of Peace and Plenty. To the right is a figure of the king, who wears a laurel wreath upon his head, and holds a truncheon in his hand. He is attended by Science, Architecture, and Liberty, whom he bids render assistance to the languishing City. Behind the king stands his brother, the Duke of York, who holds a garland in one hand wherewith to crown the City, and in the other a sword for her protection. Justice and Fortitude bring up the rear; while beneath the raised pavement upon which the king is seen, grovels Envy, gnawing at a heart. This figure gave rise to an amusing query some time back, a correspondent of *Notes and Queries* asking the editor of that paper whether it was intended to represent a man swallowing an oyster!

Although Cibber was a sculptor of great capability, as shown by his well-known figures of 'Raving and Melancholy Madness,' which were formerly over the gates of Bethlehem Hospital, and are now in the Guildhall Museum, this specimen of his work has been severely criticised. Wren's biographer considered it sufficiently rude and gross. 'Charles,' he continues, 'is bewigged and be-Romanised; scaffold poles support Portland stone clouds, and solid genii float bisected with joints of mortar as thick as their fingers. The scaffolding, ladders, and hodmen have been admired for years, and record the dresses of the labourers with more fidelity than that of the monarch and his architect.'

The total cost of erecting the Monument was £13,700, of which Cibber was paid £600 'for carving the hieroglyphick figures'; Robert Bird, coppersmith, £128, 6s. for the copper urn; and William French, £104 for setting up the balcony. The remainder mostly went in masons' and carpenters' charges, &c.

In the present day, when there is everywhere a craze for building Babels, the 'Metropolitan Maypole,' as the Monument has been called, is

no longer to be marvelled at on account of its proportions. At the time of erection, however, it was spoken of as 'the biggest and highest all Europe has to show,' being considerably taller than the columns of Trajan and Antoninus. But if our pillar does not impress the visitor of to-day with the magnificence of its proportions, it may at least claim his attention on the score of the historic interest with which it is imbued. It is for this reason, perhaps, that the greater number of sightseers in London betake themselves to Fish Street Hill; although not a few find the journey up the winding stairs—three hundred and more in number—and the admission fee of threepence repaid by the view which is sometimes to be obtained from the summit. Addison on one occasion visited the Monument in company with his friend the fox-hunter, and found the 'perpendicular march' very trying both to wind and limbs, having to pause for breath several times on his way up. His friend, on the contrary, being a 'well-breathed man,' quickly mounted the steps; and by the time poor Addison emerged from the darkness of the staircase, had counted all the steeples and churches that were within sight, and was calculating upon how many acres they stood. The number of warehouses and barns visible from this elevated position raised in his mind thoughts of Popish meeting-houses which required all Addison's persuasive powers to dispel. On reaching the street again, the fox-hunter was more than joyed at reading the inscription which accused the Papists of burning London, as he had always been under the impression that the Presbyterians were responsible for the act. This impression was the result of a country attorney's information, who doubtless held opinions savouring of Papacy.

The Royal Society at first made use of the Monument for astronomical observations; but the vibration of the column, due in some measure to the constant stream of traffic in the vicinity, so affected the nicety of their experiments that they had to be discontinued. Owing to this, a report quickly spread that the column was unsafe, and for some time people were afraid to ascend. As, however, there was no collapse, they gradually got the better of their fear, and continued their visits. It was formerly permitted to continue the upward journey beyond the cage in which visitors now stop; and Roger North gives the following interesting account of a visit at a time when the interior of the flaming urn was open to the public. He says: 'We mounted to the top, and one after another crept up the hollow iron frame that carries the copper head and flames above. We went out at a rising plate of iron that hinged, and there found convenient irons to hold by. We made use of them, and raised our bodies entirely above the flames, having only our legs, to the knees, within; and there we stood till we were satisfied with the prospects from thence. I cannot describe how hard it was to persuade ourselves we stood safe, so likely did our weight seem to throw down the whole fabric.' Those who have paid a visit to the top of the Eiffel Tower will doubtless remember experiencing a similar feeling on a larger scale to that described by Roger North.

The 'London Spy' could not, of course, omit seeing the Monument in his travels, and was

informed by his guide that it was the first thing that caused wry-necks in England, by reason of the people 'staring at the top on't.' As for the utility of it, the vintners' boys and drawers visited it once a week for the purpose of exercising their legs and learning the 'tavern-trip' by running up to the balcony and down again. An instance is on record of a drawer at the *Baptist's Head Tavern* in the Old Bailey performing this feat for a wager which was laid by some of the frequenters of that house. The boy was allowed three minutes, but was down again in two and a half, a performance which gained him the applause of the bystanders, if he did not manage to get the wager paid.

The Monument seems to have had the same fascination for suicides as some other lofty structures, notably Clifton Suspension Bridge. No fewer than seven persons have met their deaths from this pillar, six of which were suicides. Cradock, a baker, was the first to throw himself over in 1788. Next on the list is Lyon Levi, the diamond merchant, who was in the thoughts of the 'vulgar little boy' when he was contemplating self-destruction from Margate pier:

And now I'm here, from this here pier
It is my fixed intent
To jump as Mr Levi did
From off the Monument.

A baker named Leander; Margaret Moyes, a baker's daughter; a boy named Hawes; and Jane Cooper, a servant girl, were the other unfortunate victims of suicidal mania, the seventh death being that of a man who fell from the balcony accidentally while looking at a live eagle that was kept in a cage there. Advantage was taken of these melancholy occurrences to publish 'special' news-sheets containing detailed accounts of them, with a grotesque illustration, and perhaps a few verses on the subject with a moral of some sort running through them.

SUNSTRUCK.*

CHAPTER X.

'No, my boys; I am going to say no more about it. I believe you, John Manton, fully. I grant that the declaration was an accident, and that you would have spoken to me. It has been a surprise, for I could not help suspecting Josee of liking you, and I thought it was mutual.'

'On my honour as a man, Captain Greville,' cried Manton, 'never since I have been your guest have I said word, or given your adopted child look when we have been alone that you might not have heard or seen.'

'I believe you, John Manton; and sorrowfully enough I congratulate you, for you are a fortunate fellow.—Now, let's finish our wine and change the subject. There has been enough of this for one day. Another time we'll discuss the matter in its business light.—But come, Burns; you look very solemn. Is there another complication? Do you want to make a clean breast about anything?'

'Yes, sir,' cried the young officer, flushing like a school-girl; 'but I can't find words to say what I wish.'

* Copyright reserved in the United States of America.

'Shall I say the words for you?—This has all been a complete piece of deceit: you and John Manton here knew I had two pretty daughters, and you determined to come and carry them off.'

'Don't treat it like that, sir,' cried Burns; 'it is too serious. I am weak yet, and I can't speak as I should like; but I will tell you—I do love Miss Maine—Josephine.'

'And you want my consent?'

'Yes, sir,' said Burns sadly; 'but I want hers too, and it seems hopeless.'

'Faint heart never won fair lady,' said the captain, shaking the young man's hand. 'Be patient and wait.'

He opened the door and drew aside the curtain for the young men to pass into the drawing-room, where Renée and Josephine were sitting far apart.

That evening passed like a dream to John Manton, in spite of several fierce or mocking glances from Josephine's eyes. But he paid little heed to them, for he saw that she was laughing merrily and chatting with Burns half the time, while the latter was giddy with excitement and delight.

After a time, at his earnest request, she sang ballad after ballad, Renée willingly playing the accompaniments, and Josee's sweet rich contralto voice never sounded more full of power and passion. The notes thrilled through Burns, and in his fool's paradise he made himself believe that the loving expression given to the songs was intended for his ears and his alone.

But when all separated for the night, he was somewhat chilled by Josee's manner. He spoke to her tenderly, but he could not conceal from himself that the words she uttered in return had a half-mocking ring. Still, he brightened up when he reached his room, where Manton stayed with him for a few minutes, looking dreamily happy and content, for the gentle pressure of Renée's hand still clung to his fingers, and in her eyes he had read a young innocent girl's first love and devotion to the man of her heart.

'Ah, Jack!' said Burns with a sigh, 'I wish I were as happy as you seem to be.'

'There is no seem, old fellow, for it is all true—true as heaven. Only wait, and you will be the same. There; good-night. I'm too stupid to talk. It is all so new and strange—so much greater than I can believe.—Good-night, lad—God bless you!'

He hurried out of the room, through the mat-draped doorway, to his own.

Burns tossed off the white coat he wore, lit a cigar, and went to the open window to lean out over the long, low, flower-hung veranda, and drink the delicious, comparatively cool night-air. It was profoundly dark; and he listened to the peculiar notes of the night-birds in the neighbouring forest, and the whir and chirp of the abundant insects that thronged around. He was thinking of Josephine, and going through the evening once again, when it struck him that he could hear a faint whispering somewhere close at hand, like the voices of two people in eager consultation, the one deep and angry, the other almost piteous, and broken every now and then by a sob.

This roused his curiosity, and he was wondering who it could be, when the whispering sud-

denly ceased, and from a distance rose a dull, low, thrumming, followed by a chorus of voices, sounding weird and strange in the darkness, with the lightning playing faintly just above the spot whence the music seemed to come.

'How fond these blacks are of night meetings,' thought Burns. 'Well, they work hard enough by day, and they have a right to some amusement, of course.—I wonder whether she ever will—I wonder whether she ever will—— Bah! what a coward I am.'

He left the window and went to the draped doorway which separated the rooms, drew the matting aside and whispered: 'Asleep, Jack?'

A heavy breathing came back for answer, and Burns dropped the hangings.

'Asleep and happy, poor fellow. Well, Heaven bless 'em both! I wonder whether I can get my share.'

He threw off his clothes and lay down; but his mind was not at rest, and hour after hour passed with the sleep he wooed refusing to come.

At last a peculiar drowsy sensation assailed him, and he was just dropping off, when he started back into wakefulness to lie listening to a rustling movement in the next room, followed by a faint *chink* as of glass against glass, and then came a trickling sound.

'Jack's thirsty,' he said to himself. 'So am I. Shall I get out and have a good drink? Yes, I will—no, I will not; the water will be flat, mawkish, and warm. I wish I had an orange—I wish—I wish'—

It must have been something about Josee, and her hands giving him some luscious production of the captain's garden, for a smile played about his lips as he forgot his thirst, and dropped off soundly into a deep sleep, which lasted till the cathedral birds were chanting loudly in the dewy woods. Then he awoke with a start, for the idea was strong upon him that he had heard the sound of a fall, and a deep groan in his room, and that he had been grasped by a hand, while a voice whispered sharply: 'Will—Will—for God's sake—help!'

CHAPTER XI.

All was perfectly still for a few moments; and in the belief that he had been dreaming, Burns was about to settle himself down to sleep again, when a groan came from the adjoining room; and hurrying in, it was to find Manton writhing on the floor, his face all drawn and ghastly in hue, his brow covered with great agony-wrung drops, and his teeth set upon one of his arms to check the cries which strove to escape.

'Jack, what is the matter?' cried Burns, hurrying to his friend's side.

Manton raised his head a little and gasped forth in a choked unnatural voice: 'Water—burning—help!'

There was a great porous vessel on the table, and a glass by its side, which Burns filled hastily and bore to his companion, who dashed out his hand to seize the glass, but only struck it from Burns's grasp, for it to fall on the matting, every drop being spilled.

Before he could fill it again, Manton writhing in a fresh paroxysm the while, there was a sharp tap at the outer door, and Greville's voice was heard.

'May I come in?' he said. 'Is anything the matter?'

Burns flew to the door and flung it open.

'For goodness' sake, get some brandy, sir. The poor fellow is in a horrible state.'

Greville hurried to Manton's side, dropped on one knee, hurriedly asked him a few questions, and examined him the while.

'What is it, sir?' whispered Burns; 'the fruit?'

'Fruit? No,' said Greville, through his teeth.

—'Here, Manton, my lad, try and speak. What have you taken?'

No words came, but the young man feebly pointed to the water-vessel.

Greville caught up the glass from the floor, poured into it a portion of the contents of the vessel, tasted it cautiously, and then spat it violently out and poured the contents of the glass back again.

'Don't touch any more of that, any one,' he cried.—'Stop; I'll secure it;' and catching up the vessel, he hurried with it out of the room, to return at the end of a few minutes with another glass, whose contents he forced the young man to swallow. It was a hard task, though, for his teeth were set fast, and he was writhing and groaning in the midst of agony which was insupportable.

By this time the whole house was astir. Renée and Josephine had hurriedly dressed, and the former had been twice to the bedroom door to beg for news, but only to be summarily dismissed, and return to her companion, whose face was drawn into a set frown, her eyes looking wild and strange, and in her way she seemed to be suffering as deeply as Renée.

'What does papa say?—what does he say?' she whispered hoarsely. 'Is it the old illness come back?'

'I don't know. He will not speak. I was to go back and wait,' sobbed Renée. 'Josee, dear, do you think he is very bad?'

The girl made no answer, but began to pace the room hurriedly, looking wild and strange. Several times over, she shuddered and made for the open window, as if to hurry out into the garden; but she always checked herself, and resumed the hurried pacing of the room.

Twice over, a low moaning reached them, and Renée ran to the door, wringing her hands; while Josephine thrust her fingers into her ears to shut out the sound.

Then there was silence again, and they waited, till all at once, so wild a cry of agony rang out that Renée could bear no more, and, rushing up-stairs, passed at once into the sufferer's room.

Her father started from where he had been bending down over Manton, trying to restrain him, and turned to her.

'Renée, my child,' he whispered, 'how could you be so mad as to come here. I am doing everything I can for him.'

'Yes, yes,' she said in a pitiful tone; 'I know, I know; but you can't do this;' and, sinking upon her knees by the pillow, she laid one of her soft white hands upon the young officer's brow, as she whispered: 'Jack—Jack—my darling—if I could but bear it for you!'

He turned his strained and bloodshot eyes to her, raised his hands and pressed them upon hers,

a low painful sob escaping from his lips before he set his teeth and lay with his eyes closed, evidently suffering acutely.

Renée looked up at her father—a long appealing look; but he shook his head.

'I can do no more,' he said. 'That is right: try and get him to suffer patiently. There may be a little hope.'

Renée's eyes dilated with horror.

'May be a little hope!' she said half aloud; and, uttering a stifled cry, she laid her brow upon the edge of the bed, her lips moving fast in prayer.

Greville stood gazing down at the young people for a few minutes, heart-wrung by his child's agony, and fully realising now the potency of the first love awakened in her breast. Then with a sigh of misery he walked across to the window, where Burns was standing, ready to look appealingly in his eyes.

Greville read his thoughts, and said in a whisper: 'I can do no more. It is horrible—horrible!'

'Yes; but tell me,' said Burns, 'what is the complaint? Have you given him medicine?'

'Don't you see what it is?'

'No: only that he seems in frightful, cramping, burning pain.'

Greville was silent for a few moments, and then gloomily: 'You must know the truth,' he said in a voice so low that his words were hardly audible: 'he has been poisoned.'

'What!' cried Burns excitedly.

'Hush! Come down with me to my den;' and, unnoticed by Manton and Renée, they stole from the chamber, and into the captain's private room, half-office, half-study, where, after closing the door, he unlocked a cupboard, took out the porous vessel that had stood upon Manton's table, and then taking a glass, he poured out a little, tasted it, and spat twice.

'Yes,' he said; 'that is the third time of testing it. I cannot be mistaken—it is manchineel.'

'Manchineel? What is manchineel?'

'The deadly poison used by the black people to get rid of their enemies.'

'Impossible!' cried Burns. 'Poor Jack had no enemies. The black people liked him, for he was generosity itself. No one could be so cruel. And without a motive! There was no'—

He stopped short, with his face blanching and a look of horror in his eyes.

'Well,' said Greville hoarsely, 'what are you thinking? You are suspecting some one.'

'I? No, no!' cried Burns. 'Whom could I suspect?'

The captain's face was very white too, as he caught Burns's arm in a fierce grip, and his voice sounded strange in the young man's ears. 'That drug is terrible in its effects. Please God, the antidote I have given may save John Manton's life; but if he dies, I have seen enough yesterday and this morning to know that it will destroy another young life as well. William Burns, you suspect some one; and if I can bring home the guilt to the wretch who has done this thing, even if it were one dear to me, he should suffer by the law—if I could withhold my own hand, and not be his executioner myself. Now! Speak out: the truth. Hah!'

It was as if a sudden revelation had flashed across his brain, and loosening his fierce grip of the young man's arm, he staggered back into a chair, and sat gazing wildly up at Burns.

'No, no!' he panted; 'it is too horrible. It is impossible.'

'Yes,' cried Burns; 'the thought is too horrible. It is impossible.'

'He thinks the same—he thinks the same,' muttered Greville; and he let his face drop down into his hands, as, in rapid review, he ran over the incidents of the love matters of the young people, of the pangs of jealousy and hatred, and of there being the strain of the vindictive black blood in certain veins. Then he thought of the people on his plantation, their secret meetings, their dabblings in witchcraft so called, and poison; and he recalled the different cases of death which had occurred in the island, several of which could be traced to poison.

'No, no!' he gasped, as he raised his head again, and saw Burns gazing at him with a look full of agony and despair. 'It is impossible. But you—you are thinking the same still.—You believe it—you suspect her.'

'No,' cried Burns fiercely. 'I do not suspect her. Do you think I could suspect the woman I love of such a horror!'

Greville stood with his brow deeply lined, gazing straight before him, and as he remained there fixed, the glass rattled against the porous vessel, for the floor vibrated with the hurried tread of some one walking to and fro in the next room, and once more the eyes of the two men met in a penetrating gaze.

'Not in a sane moment,' said Greville at last aloud, but as if speaking to himself; 'but perhaps in a mad fit of jealous passion.—Come with me.'

'No,' cried Burns fiercely, as he barred the way. 'Where are you going?'

'To see my patient,' said Greville, with a bitter smile.

Burns gave way, and followed his host into the chamber, where the situation remained the same. Manton was in agonising torture, but one arm was about Renée's neck.

He opened his eyes as they entered, and Greville crossed over to him and laid his hand upon his brow.

'Don't—don't let me die—now,' he whispered. Then his face contracted again, and Greville shrank away, signing to Burns to follow.

'It is too hard to bear,' he whispered. 'Poor lad!—poor lad!'

He led the way to his own room again, and now Burns caught his arm.

'A doctor,' he said—'a doctor.'

'There is not one upon the island,' replied Greville. 'If there were a hundred, they could do no more than has been done.'

He stopped, listening to the rapid pace to and fro in the dining-room, and, with his face contracting more and more, he whispered the one word 'Come!'

'No,' said Burns again fiercely. 'You shall not go there. It is a cruel insult. It is madness. I tell you it is impossible.'

'And yet in your heart you believe it,' said Greville sternly, 'or you would not try to stop me. Come.'

'You shall not go,' cried Burns.

'Silence, boy. I stand to her in the place of her father. Recollect, too, that you are as weak as a child. I will be just, but I must have this cleared up and at once.'

He grasped the young man's wrist in a tremendous grip, and Burns was constrained to accompany him as he led the way into the dining-room, where, with her long black hair dishevelled and her face wild with horror, Josephine was walking rapidly to and fro, caged in by the horrible thoughts from which she was trying vainly to escape.

CHAPTER XII.

The girl did not hear them enter, and walked on with her eyes fixed, like one walking in her sleep, till she was close upon Greville, when she started excitedly, caught at his arm, and thrust her face close to his.

'John Manton?' she said in a husky tone of voice. 'How is he? Is he better?'

'No,' said Greville, gazing down at her fiercely.

'What is the matter with him?' she cried imperiously.

'You know,' said Greville coldly.

'I? No! Oh no! I do not know,' she said rapidly; and she laid her hand upon her breast, as if to stay its throbbings.

'Then I will tell you,' said Greville in a slow, hard, magisterial tone.

'No, no,' cried Burns. 'Captain Greville, it is an outrage.—Josephine, go to your room. You shall not hear his words.'

She darted a grateful look at him; and then faced the captain, as he said sternly: 'Silence, boy! That poor fellow—my guest—the man to whom my child has given her heart—lies above us, foully—treacherously poisoned.'

'Ah!' cried Josephine, uttering a wild cry.

'No, no, no; it is impossible.'

'It is possible, for it has been done.'

'No, no,' cried Josephine wildly, as she threw herself upon her knees at the captain's feet. 'Don't say that. Father!—my more than father, don't say that.'

'I do say it; I will say it; and it has been done by the accursed hand of one who was wildly jealous of him—mad that he had fixed his affections elsewhere.—Josephine, I took you to my heart as a child; I have been as your father, and now you have stricken at me through him—through them.'

'What!' she cried, shrinking back so that she half crouched upon the floor, supporting herself by one hand.

'I say you have stricken at me through them.'

'No, no; it is not true,' she cried hysterically.

'No other hand could have done the cruel deed; no other could have had access to the room above and drugged the water with manchineel.'

'Manchineel?' cried Josephine, gazing wildly before her. 'Ah, yes; it must have been manchineel.'

'Your words almost convict you, girl. You have always loved to consort with the wretched women who practise upon their fellow-slaves. You know of the powers of these drugs.'

'I? No,' she cried hurriedly; 'very little.'

'Enough for the purpose. Answer me: you placed that poison where he would drink of it?'

'I?—No, father, no!—It is too cruel.'

'Yes, it is too cruel,' cried Burns.

'You deny it? Do you deny that you cared for Mr Manton, and suffered bitterly from jealousy at what you have seen?'

'No,' she cried, rising slowly, and shaking back her hair from her face; 'no; I do not deny that I did suffer, as I am suffering now.'

'Captain Greville, you hear. Have some mercy.'

'Yes, I will have mercy if she will confess.'

'That I poisoned John Manton!' said Josephine proudly. 'No; I cannot confess. I would sooner have poisoned myself and been at rest.'

'I'd give the rest of my poor life to know that this was true,' cried Greville.

'But you believe me guilty,' said the girl, drawing herself up. 'Well, I am little better than a black slave. I have lived upon your charity all these years; now send me back amongst your slaves; punish me, if you will. I could not be more wretched than I am. What will you do—flog me? Well, I have nothing to confess.'

'Josephine, my child!' cried Greville wildly, 'it was in a fit of madness.'

'Ah!' she cried, as his appealing tones rang through her, and she threw herself at his feet.

'Now then—the truth—the truth?'

She rose and shrank away. 'I have told you the truth,' she said coldly, 'and you do not believe. I would have died sooner than injure him and break poor René's heart.—And you,' she said, turning sharply upon Burns and speaking with a curiously *naïve* innocence of manner. 'I am not blind: you always liked me from the first. Do you, too, believe I could be the wretch he thinks?'

'No,' cried Burns excitedly, as he caught her hands and held them firmly. 'I do not believe it, dear; and I'll fight your battle against the whole world.—Now, Captain Greville, what have you to say?'

The captain turned upon him slowly as Josephine drooped over the hands which held hers, kissed them both, and then sank down weeping hysterically.

CURIOUS WEAPONS.

In these days, the appliances of war have been elaborated to such a degree that it is questionable whether they are not rather too scientific to be used by excited men in so rough a business as actual fighting. But on this subject invention has never stood still, and there is hardly any race so barbarous or low in the scale as not to have some ingenious 'slaughter-weapon' to show.

Perhaps a too practical acquaintance with the claws of wild beasts led some races to copy their use. The best-known instance of this is the Indian 'bâgh'nakh,' or tiger's claw, consisting of from three to five steel claws about two inches long, connected together, and furnished with rings in which to insert the fingers. This horrid con-

trivance was carried in the left hand, leaving the right free for a dagger; and the identical 'tiger-claw' wherewith Sivaji, founder of the Mahratta kingdom, murdered the Mogul's general, is now in the Indian Museum. But in actual war the bâgh'nakh would have been only an encumbrance, and its use was confined to private feud. Some of the White Nile tribes use an iron ring on the right wrist, with diverging blades four or five inches long. The Samoans, without the feline race to copy, invented the 'fighting glove,' a sort of mat of coco fibre, tied to the hand by strings, and thickly set with rows of sharks' teeth.

The boomerang (literally, 'kangaroo-stick') is too well known to need description; but it may be said that there are two varieties, one of which, the war boomerang, was not intended to return to the thrower. It is much less curved and heavier than the other or 'circling' weapon. Boomerangs of this sort were in common use in Southern India, made of wood, iron, and even ivory; but the returning boomerang is solely Australian. The best performers were the blacks of the Riverina plains, and marvellous some of their feats were; but few of them are left, and before long, boomerang-throwing will be a lost art.

The 'chakra,' or quoit, of India is a very ancient weapon. It was much affected by the 'akalis,' or champions, of the Sikhs, and is still in use in the Punjab. The akali wore a conical cap some two feet high, formed of plaited cane, covered with blue cotton cloth, surrounding which, hoop-fashion, were sometimes as many as nine quoits, from a foot to four inches diameter, of light thin steel, and sharpened outwardly to a knife-edge. When the warrior desired to use them, he passed his forefinger through the uppermost to lift it off, gave it a rapid spin on the finger overhead, and launched it horizontally at his enemy's face. Some of these men were said to have made good practice at eighty yards. But its use was resorted to only when hard pressed, as the quoits were often valuable articles, inlaid with gold, and the chances of recovery after a *mélée* would be small.

Another odd missile weapon is the Central African 'trombash.' This is a species of knife, but of the most eccentric shape, no two specimens being alike, and resembling old English capital letters in outline. They are formidable weapons when used by practised hands; but it is quite evident in examining them that a good deal of labour has been wasted on them, for many of the blades and projections are so placed as to be perfectly useless. Africans in general seem to have a weakness for unnecessary detail in their weapons. Some of them spend a vast amount of labour and skill in forging the most atrocious-looking arrow and spear heads, bristling with barbs till they look like awns of barley imitated in iron. Some of them go so far as to make the barbs point in opposite directions, so that the arrow may neither be drawn out nor pushed through. It is strange that no African race seems to have any idea of making a really effective sword or dagger. All those illustrated in books of travel or exhibited in collections are curiously unpractical instruments. The same peculiarity

can be seen in the curious axes used by the Khonds and other aborigines of Central India, the blades of which are scolloped and crescented in a way to take away greatly from their efficiency.

The national Malay weapon, the kris, is said to have been invented by a Javanese monarch of the fourteenth century. Its varieties are said to exceed a hundred, and there are in Javanese no fewer than fifty names for them. It varies in size, from the two-feet wavy blade of Sulu down to a mere toothpick. But the peculiarity is that the weapon is never ground, but kept rough and saw-like in edge, by scouring with lime juice or the juice of an unripe pine apple, sometimes mixed with arsenic; and it is on this account that kris wounds are so dangerous. Old specimens are so eaten away by this practice that the blade seems formed from a bunch of wires roughly welded up. Such crises are highly valued, and some of the ancient ones, heirlooms of chiefs, with grotesquely carved and inlaid hilts and sheaths, are almost unpurchasable.

The Bornean 'mandau,' or 'head-taker,' is a modification of the Burmese 'dah.' It is a heavy thick-bladed cutlass, from twenty to thirty inches long, and the edge is ground from the right side only, the left side being forged slightly concave. The blade is also slightly curved to the right, so that the cutting action of the weapon is like that of an enormous gouge. Only two strokes can be dealt with the mandau—from right to left downwards, and left to right upwards.

But it is to India that we must look for strange and ingenious varieties of the sword and dagger, as well as for the most striking examples of art in arms. The weapon common to every part of Hindustan, so as to deserve the name of the national arm, is the 'katar.' This is a broad two-edged dagger, the hilt of which is formed something like an H, the hand grasping the crossbar, which is generally double, while the side-bars extend on each side of the wrist. Some katars are made with five blades, which unite into one, but, by squeezing together the crossbars, diverge like the fingers of a hand when the thrust has been given. Other katars are made in sets of two, or even three, of diminishing sizes, the blades of the larger being hollow, and forming sheaths for the smaller. Some of the Southern Indian katars, known as 'death-givers,' are immense weapons, nearly two feet long in the blade; and the hilts are a mass of fantastic scroll-work and mythological monsters, the cobra with expanded hood figuring largely. There is also the 'bich'hwa,' or scorpion's sting, a doubly-curved dagger; the 'khanjar,' a larger form of the same; and the 'peshkabz,' or hunting-knife. But none of these elaborate weapons have about them the terribly 'business-like' look of the Khyber knife (ch'hura), with its ponderous single-edged, tapering blade, and plain ivory hilt.

The sword-stick, or 'gupti,' is of Indian origin. There is one form of it which was peculiar to chiefs and men of rank. The hilt of the sword, forming the handle of the stick, is crutch-shaped, and the owner, when lying on his divan, would have his arm resting upon this, so as never to be taken quite unarméd. It was called in Persian 'takiyah-i-zafar,' or 'cushion of victory.' Another form of concealed sword was made so

flexible as to be worn round the waist like a girdle.

The swords of Hindustan are of endless variety in size and shape, the most common being the 'teggha' and 'talwar,' broad much-curved blades, wrongly styled scimitars, the real scimitar being a clumsy chopper-like weapon, nearly straight, and widening to the point. There is the 'khanda,' a heavy straight sword with basket-hilt, like the Scottish claymore. The khanda was an object of worship to the Rajputs, precisely as to the Scythians. The 'pata,' or gauntlet sword, much used by the Mahrattas, was a development of the 'katar,' having a long rapier blade, often of Spanish make, and a cylindrical hilt, into which the arm was passed to the elbow. The Persian sword, however, was valued above all others, and particularly those of Khorassan. These are the real 'Damascus blades,' the damascening being produced by the crystallisation of the steel. Connoisseurs recognise ten different varieties of watering or 'jauhar,' and the most incredible prices have been given for fancy specimens. In Burnes' Visit to the Court of Sind, he says: 'I have had in my hand a plain blade which had cost them [the Amirs] half a "lac of rupees" [in that day about five thousand pounds]. Such swords as these often bear long inscriptions in gold inlaying, such as: "I am the produce of Persia, of ancient steel and water. When a brave man wields me, a hundred thousand Hindus will perish by my edge."' There is a very singular sword in the South Kensington collection, composed of two very thin blades, with half-hilts, which are made by a series of catches on the inner side to unite and form a single weapon. From the great beauty of the ornaments and mounting, it was probably made by some renowned armourer for presentation. But the great brittleness of these swords makes them unfit for use by Europeans, who would shiver them to pieces by a 'swashing blow;' while the Oriental employs their razor edge only for the 'drawing' cut.

The Nepalese 'kukri,' or heavy-curved knife, with the edge on the inner side, is familiar by name to readers of the accounts of our 'little wars,' in which the Ghoorka infantry have taken part. But there is another Nepalese weapon, the 'kora,' the most strangely-shaped sword ever used, which, starting from the hilt about an inch and a half wide, when near the end turns at right angles and expands to six inches. The late Jung Bahadur, a noted expert at all Eastern arms and exercises, was able to decapitate a bullock with one blow of the kora.

There is a weapon known as the 'crow's beak,' which was formerly much in use among men of rank in Persia and North India. It was a horseman's weapon, and consisted of a broad curved dagger-blade, fixed at right angles to a shaft, pickaxe fashion. The shaft encloses a dagger, unscrewing at the butt end. This concealed dagger is a very common feature of Indian arms, and especially of the battle-axes of Persia.

The club, or mace, was probably the first, as it is the most universal weapon, and every nation would seem to have some form peculiar to itself. The Maori spent years of labour in grinding to shape his battledore-like 'merai' out of jade

or greenstone; the New Britain savage makes a hole through a granite pebble by dropping water on it while hot, and thus forms the head of his club; the Fijian found ready to his hand a tree, whose evenly radiating roots he trimmed into an exact likeness of the medieval 'morgenstern,' wherewith the Swiss battered down the Austrian ranks at Sempach. The mace of the Persian horseman was of steel, with a head formed of six or more radiating blades or ridges, and had often a basket hilt like a sword. The terrible Mahmud of Ghazni, like the knight of Border song, 'at his saddle-girth had a good steel sperthe, full ten pound weight and more,' and it was with this that he shattered the idol of Somnauth before the eyes of the horrified priests, strewing the temple floor with the jewels hidden within.

The bow as used by Asiatic horsemen assumes a curious shape. They were made of horn, generally buffalo horn, in two pieces, joined by a wooden centre, and when unstrung, had the form of a capital C, which enabled them to be hung over the arm on horseback. When strung—a difficult feat to those unused to them—they took the double curve of the antique bow as seen in the representation of Cupid. This was the 'Tatar's bow,' used by the Scythians, Parthians, and Persians, and, up to quite recent times, in India. It was drawn by the thumb alone, on which the archer wore a broad thick ring of horn, ivory, or cornelian, on whose edge the bowstring rested. The long-bow was also much in use among Indian infantry of the middle ages; but neither they nor any other Asiatics appear to have done such execution as the English archers of the same period. Bernier says, describing a battle between Aurungzebe and his brother Dara: 'They draw their arrows with a marvellous swiftness, one man being able to draw six of them before a musketeer can discharge twice; but, to say truth, their arrows do but little execution; more of them are lost in the air or broken on the ground, than hit.' The bow, in fact, requires more than any other weapon constant practice from childhood; and strong Englishmen of the present day are quite unable to use the bows of the half-human Mincopies of the Andamans. There is a curious example of a repeating crossbow in the United Service Museum, taken from the Taku forts, at which place the Chinese archers caused us heavy loss on the first occasion of the attack.

The many strange machines known as catapults, balistas, &c., had their counterparts all over Asia. It may be mentioned that the last instance of the use of the catapult in Europe was at the great siege of Gibraltar, where one was built, by order of General Eliott, to 'lob' shells into a part of the Spanish works too close to allow the guns to depress enough. But when cannon and muskets had once come into use, they were soon adopted everywhere. The great gun of Bijapur was cast in 1549 at Ahmednagar. It is twenty-eight inches in diameter of bore, and weighs over forty tons; and as the two places are distant nearly two hundred miles as the crow flies, it would be interesting to know how it was transported. It was used in several battles by the Mogul emperors, sacks of copper coins being fired from it. It was named Malik-i-Maidan, or 'the monarch of the field.' There was a gun at Dacca

thirty-six feet long, and weighing some thirty tons, made of wrought-iron bars laid together like the staves of a cask, and hooped with iron rings. Its bore was about fifteen inches. This gun was worshipped by the natives of Dacca; but about 1780, the island on which it lay was washed away, and it disappeared in the Ganges. The celebrated fort of Asirgarh had a gun of about the same calibre, which the natives believed capable of pitching a four-hundred-pound ball fourteen miles. It was a common practice with Eastern armies to cast their cannon before the place besieged, so as to avoid the difficulties of transport. In 1838, at the siege of Herat by the Persians, Mahmoud Shah had a heavy bronze gun cast in his camp; and when the siege was raised, the gun was sawn to pieces, and taken back to Teheran. The most celebrated guns of this sort are the 'kemaliks' of the Dardanelles, huge bronze howitzers, some of them over two feet in calibre. At the passage of the Dardanelles by Sir J. Duckworth's fleet in 1806, the ships suffered heavily from these seemingly antiquated monsters, the range being short. One shot killed and wounded twenty-five men, and an eighty-gun ship was all but sunk by an eight hundred pound stone ball. At the siege of Rhodes, the Turks constructed mortars by hollowing out cavities in the solid rock at the proper angle; and in the arsenal at Malta is a trophy of the long and glorious defence of Valetta, in a Turkish gun, about a six-pounder, composed of a copper tube, coiled over with strong rope, and 'jacketed' with raw hide. In the same collection are some antique 'quick-firers,' breech-loaders, with small bores and immensely long barrels, like punt guns. The Malay pirates put great trust in the long brass swivel guns called 'lela'; and in Borneo, these lelas were used as a kind of currency, large sums being estimated in guns. The Chinese cast excellent bronze guns (there is a fine specimen of them in Devonport Dockyard); but so little did they understand gunnery, that in the so-called 'Opium War,' the forts of the Bocca Tigris, defending the Canton river, had the guns built immovably into the walls. The Sikh gunners opposed to us in the two Punjab wars, though they loaded with amazing recklessness, shovelling in the powder from open boxes, stuck to their guns to the last. The blood of the first man killed was smeared on the gun, and the whole detachment died beside it, sooner than retreat.

Eastern muskets and matchlocks are remarkable for their great length of barrel, which is necessary to consume the large charge of weak, slow-burning powder. The 'Damascus' or 'laminated steel' twist barrels were brought to a high state of perfection in the East long before our gun-makers adopted the plan. The same gorgeous ornamentation was applied to firearms as to swords, 'armes de luxe' being made for chiefs, in which even the bands attaching the barrel to the stock were of massive gold, and the muzzle cased in gold and set with jewels, the foresight being sometimes a diamond, in anticipation of a recent patent. Skilful marksmanship has always been highly valued in India. Akbar the Great was a noted shot, proving the muskets with his own hands, so that it may be guessed that there was not much 'scamping' done in the royal workshops. Bernier, however, says of Aurung-

zebe's infantry: 'Their musketeers be pitiful men, afraid of burning their eyes or singeing their great beards, but most of all, lest some Djin or evil spirit burst their musquet.'

CASKS CUT FROM THE TREE.

FEW objects are more familiar than the common cask or barrel; yet few people have probably been at pains to consider the skill and ingenuity which have succeeded in bringing to perfection an invention as scientific as beneficial all the world over; and probably fewer still are conversant with the brain-power and time which have been expended in attempts to produce machinery which shall at the same time cheapen and expedite the manufacture of these well-known and useful contrivances. Barrels are no new thing; as far back as the time of Pliny they were in use, and that author mentions the Alpine valleys as the locality of their invention.

The trade readily divides itself into two great classes—the wet and dry manufactures; or casks designed to hold liquids, or dry goods. A third subdivision, known technically as 'white cooperage'—that is, wooden tubs, churns, pails, and other even-staved vessels—may be added.

When it is considered that tight casks have not merely to withstand the pressure of the contained liquid, but frequently also that of gases, arising from fermentation of such liquid, in addition to the handling and rough usage to which they are at all times liable, it will be readily understood how important are sound materials and workmanship in their construction.

A cask is a double conoid—namely, having its greatest diameter—technically known as the 'bulge' or 'belly'—at its centre; and this being borne in mind, the complex shape of each stave will be at once appreciated. Not only is the stave curved lengthways to form the 'bulge,' but crossways it is similarly made to form part of the circumference of the cask; whilst the edges must receive the exact bevel to fit those on either side along their entire length. The two processes known as 'chiming' and 'crozing,' which consist in finishing the ends for receiving the heads, yet remain to be performed. The 'chime' is the bevel formed on the extremity of the staves; and the 'croze' is the groove into which the ends or heads fit. Hooping, generally with iron bands, completes the manufacture of a cask.

Having thus sketched in brief outline the routine in vogue in the cooper's trade for manufacturing casks, we pass to consider as concisely as possible Mr Oncken's invention for producing staveless casks direct from the tree. Mr Oncken aims at turning out casks from one piece of wood—the body of the cask to be formed of one long single stave; the ordinary shape—that is, the double conoid—being retained. The method of preparing the body of the cask may be likened to sharpening a lead-pencil by a pocket sharpener, the shaving produced forming the staves of the cask.

The stem of a tree—poplar is frequently chosen—is first cut into lengths corresponding to the size of the cask. These lengths are then boiled

for two or three hours in a closed vessel, a current of electricity being passed through the water the whole time. The chemical action thus produced in combination with the prolonged boiling gives to the wood the necessary softness, and enables the subsequent cutting process to be performed without difficulty in a machine rotating the log in the same manner as the ordinary lathe, whilst advancing it towards a broad block fixed on a frame, having a slot in it similar to that of the common joiner's plane. As the trunk of the tree is revolved against the block, a continuous sheet of wood is cut of any desired thickness, and drawn out flat by hand on to a table at the rear of the machine. The sheets are then passed through a grooving-machine, which cuts the 'croze' or groove in which the head is eventually fitted. Another machine seizes the sheet between two arms, and by the means of knives, cuts a series of mortises or slots round the sides, giving it when made up the desired conical shape. Eventually, the sheet reaches the cooper, who rolls it into cylindrical form, drives on the hoops, and renders it a perfect barrel, after drying in a special apparatus.

The invention above detailed has safely passed the experimental stage, and is already in full practical operation at Merxem, in Germany, where Mr Oncken has started a factory, and is busily engaged in turning out his staveless casks.

When it is considered how numberless are the quantities of casks in daily use in every part of the globe, and the innumerable purposes to which they are devoted, hardly a trade or industry being carried on without them, the wide field open to improved and economical means of production of such indispensable necessities of civilisation, will be readily appreciated.

'HOME, SWEET HOME.'

'I'm going home, I'm going home!'

A ragged urchin cried one day;

The blue sky looked a far-off dome,

As he pursued his homeward way.

I wondered if 'sweet home' to him

Had music's meaning soft and clear,

Those words that mock, or seem a hymn,

According to the list'ning ear.

The urchin's voice was jubilant;

And yet I judged his home must be

Where daily toil kept off grim want,

Or struggled with chill poverty.

But if the lamp of love burns bright

Young hearts to warm, and cheer, and bless,

'Tis still 'sweet home' where day and night

Is felt some human happiness.

A palace home without love's spell

Can only be a stately Inn,

Though mortals are constrained to dwell,

Its cheerless, sheltering walls within,

And dream, with undefined desire,

Of something which they do not know,

Of peace to which their hearts aspire,

Which only love can here bestow!

CAMILLA CROSLAND.

TECK AND ITS DUCHY.

THE announcement of the engagement of Prince Edward of Wales to the Princess May of Teck, and the melancholy fact of his death since, drew attention to the duchy from which the Princess's father derives his title.

It has been often a matter of surprise to the writer how very little English people visit some of the most interesting scenery in Germany, through and past which they whirl in express trains on their way to the Alps. It is true the Alps are giants and supreme in beauty. The snow and ice exercise a magnetic influence on such as are hurrying for a short holiday among the mountains away from the drudgery of office and the smoke of a capital. But there are others who have time on their hands and who saunter on their way; yet these are content to follow the beaten route and stay where the guide-book tells them there is a good hotel and a fine view. Such persons are perhaps ill disposed to venture on new ground; but there are others to whom new ground is attractive, and to such we would suggest an expedition that will halt short of the Alps—almost within sight of them, and visit the Rauhe Alb, a singular limestone and volcanic plateau between the Neckar and the Danube.

The district is interesting to the geologist, for the Jurassic limestone has been penetrated and metamorphosed by volcanic vents; the flora is interesting; this region, moreover, has been a cradle of crowned heads. Here is Hohenzollern, the ancestral home of the imperial German family; here is Hohenstaufen, whence issued the splendid imperial Swabian house that held the crown of Charles the Great till its extinction in Conradin.

Here also is Teck, whence the fair Princess draws her title. Moreover, the valleys are most quaint and beautiful; and the little towns and villages of the principality, with their russet-tiled roofs, teem with picturesque subjects for the pencil and brush. The Jura limestone makes

a great crescent with its horns to the north, and in the basin thus formed flow the Neckar and the Main. The limestone range springs out of the Black Forest chain; the Danube rises in it; then, after running east, it curves up into Franconia, and dies away into the Main Valley, between Bamberg and Baireuth. This half-moon of limestone forms a plateau, with the long slope towards the south and east, and the abrupt face towards the basin it encloses. The plateau is in itself barren and bald; the rain that falls on it is at once absorbed, and goes to fill vast subterranean reservoirs that decant into the streams at the mountain roots. The valleys torn in the limestone are wildly beautiful, the rocks assuming the most strange and picturesque shapes; and the bottoms are occupied by cherry and pear and apple orchards; or by meadows rich with grass, watered by the deep limpid streams that well out of the flanks of the mountains.

The Swabian Jura, that leads into the Franconian Jura to the east, is, in fact, a continuation of the Swiss Jura. The geologic formation is the same. Fire and water have combined to give a peculiar character to the portion of the Jura which is in Swabia, for not only have the torrents rent the sides of the mountain terrace in all directions, but the central fire of the earth has sought a vent there, and has thrown up a multitude of mud volcanoes, now quiescent indeed, but bearing unmistakable evidence of their origin. Thus the plateau of limestone is broken by a number of conical heights, of which the Rechberg rises to the height of 2316 feet, and is crowned by a little pilgrimage church. The Hohenstaufen (2237) is another of these singular cones, the summit occupied by the ruins of the castle of Barbarossa. Another, again, is Hohenzollern (2840), surmounted by a marvellous crown of towers and battlements, a modern restoration of a medieval castle, the nursery of the present imperial house of Germany. The geologic formation consists of the dark lias, the lowest of the rocks that at all shows; then the brown oolite, and above that the white Jura limestone.

Nothing can be conceived more dreary than the plateau, with its white road glaring in the mid-day sun, the miserable starved barley-fields on each side of it, and the cottages whitewashed till they hurt the eye—in the blaze of the summer sun. But the contrast, the moment we pass into the valleys, is the more charming, and the views from the high points, such as Hohenstaufen or Teck, are of peculiar beauty, especially at sunset, when the golden orb has sunk behind the purple-domed heights of the Black Forest. Or, again, looking south, to see the marvellous panorama of the Swiss and Bavarian Alps before one, ghost-like, their silver peaks alone visible, their bases lost in ethereal blue.

The castle of Teck lies on a peak of the Rauhe or Swabian Alb, that runs out from the main mass above the village of Owen in the Lauter Valley. The valley is walled to the west by a singular spur of limestone, or rather peninsula, connected with the main range by a narrow neck, that has at some prehistoric period been cut through by a fosse and a bank thrown up, so that it was made an almost inaccessible camp of refuge in time of war. The valley watered by the Lauter is of singular beauty; it is held to be the most lovely in the whole district. In June it is a sea of flowers, from the fruit-trees that occupy it—plums, apples, cherries, pears, damsons—and the stately old walnut trees are certain to attract admiration. Vines are grown on the slopes of the hills. Unhappily, a vineyard is not so picturesque as one would have fain wished it, so we will say no more about them.

The nearest station is Kirchheim, on a branch line from that connecting Stuttgart and Ulm. From Kirchheim a good road leads to Owen, about five miles distant, and when there, we are at the foot of the heights of 'the Teck.' This is a peak of limestone, connected with the main mass by a neck of rock, and it has a volcanic hill thrown up to the north of it, connected with it by another neck. From the platform of the old castle the eye looks down some twelve hundred feet into the valley below over the precipices of limestone. This old ducal residence, this eagle nest of a noble family, is surrounded with basaltic elevations, that stand as watchmen about it. Across the green meadows and glittering thread of the Lauter rise precipitously the great crags to the west, that form the plateau out of which rises another fortress, the Hohenneuffen. The view is most impressive; the conical Achalm shooting up above Reutlingen, capped with the towers of a venerable castle, stands to the west. The Rechberg, with its little chapel high up in the clouds, is visible to the west; Hohenstaufen, Stuifen, the Rosenstein, and other points, form a coronet of volcanic cones surrounding Teck on the horizon. And far away in the west lie the dark masses of the Black Forest. Below, the plain, with its clusters of brown-tiled houses in hamlets and towns, with the spires of churches, and here and there an

old tower of an enclosing wall, rising out of the richest foliage and the most smiling pastures, forms a picture of as great a charm in its own way as the distant prospect.

The castle of Teck must at one time have been very extensive, if we may judge by the remains. Who built it is unknown. In 1152 it was pawned by Bertold of Zähringen to the Emperor Frederick I.; but it was redeemed shortly after, and it formed the nucleus of the estates of the family of Zähringen in this part of Swabia. In 1525, when the peasants rose in arms against the feudal lords, this castle, like almost every other in Swabia, fell into their hands, and was burnt. However, in 1557 a chapel was still in use in the midst of the ruins, and some attempt was made in 1564 to convert the remains of the castle into a great breeding-place for horses and cattle, and a cheese and butter manufactory. It was hence that the breed of cattle that goes by the name of Teck was raised, a breed held still in esteem. In 1736, Duke Charles Alexander of Würtemberg considered it advisable to erect here a fortress after the prevailing fashion; but on his death the works were abandoned.

The Teck family was founded by Adalbert, one of the Zähringen stock, a faithful companion of Henry VI. He died in 1197. One of the members was Bertold, Bishop of Strassburg in 1223, and one of the best bishops of that see. Conrad III. received several votes of the electors to the German crown after the death of Rudolf of Hapsburg. He died in 1242. Owing to the German custom of subdividing all estates among the children equally, the Teck family was greatly reduced in wealth and power; and in 1384, Frederick IX. fell into difficulties; but was assisted by Frederick, Elector of Bavaria, and Eberhard, Duke of Würtemberg. His son Ulric rode to the Council of Constance at the head of two dozen horsemen. He died in Italy in 1432. Ludwig IX. became an Augustinian friar, and was given the patriarchate of Aquileia. He died of the plague at Basle, and was buried there, the last of his race. The embarrassments of the family had been the advantage of their neighbours; the Dukes of Würtemberg had managed to gradually absorb most of the estates, either by purchasing them outright, or by lending money on some of the manors, which the Teck Dukes were unable to redeem. As now the race had come to an end, the Duke of Würtemberg obtained a grant from the Emperor Maximilian I. in 1493 to assume the title of Duke of Teck and to quarter the Teck arms. So it remained till 1806. The title of Dukes of Teck has now passed to a line collateral to that of the kings of Würtemberg, and is borne by the son of Duke Alexander of Würtemberg by his wife, the Countess Claudine of Rhédey, who was created Countess of Hohenstein by the Emperor Francis I.

Just under the castle of Teck is a cave called the Cavern of Sibylla. In it at one time lived a certain Sibylla, who was the mother of three bold sons who carved out their fortune with their sword, and built themselves the daring tower of Wielandstein on a precipitous needle of rock a little farther up the valley. For long these three brothers lived in the closest friendship: then—all three fell in love with the same

woman, and their affection towards each other was turned into deadly hatred. They fought each other, and, according to the belief of the superstitious, at dead of night about the ruins may be heard the cries and clash of arms of the brothers, who are condemned to fight till doomsday. And then at night, from out of her cave issues the mother, and travels in a coach of flame from the Teck to Wielandstein, to endeavour to bring her sons to peace. And it is said that a certain strip along the valley where the leaves hang on the trees for a fortnight longer than elsewhere, and where the fruit is always sweeter than elsewhere, and the grapes yield a more fiery wine, marks the course along which the Lady Sibylla rolls nightly in her coach of fire.

There are a good many legends connected with the neighbourhood.

Duke Lutzman of Teck married Elizabeth, Countess of Freiburg about 1300. A witch warned her that she would die by lightning; accordingly, she was in deadly fear whenever a storm broke. After having consulted many learned scholars, one gave her a charm she was to repeat whenever a cloud passed over her head. This gave her some rest. However, she always bade her ladies in waiting look well at the sky and report to her if they saw a cloud that seemed to threaten. One day there was a great feast in the castle at Teck. Before she entered the banquetting hall, she said to her maid: 'Go forth and search the sky if all be clear.' The girl went outside, and looked in every direction. The sky was quite clear except for a tiny fleecy cloud that came up with the wind from the Black Forest. She went in and told the Duchess that there was no cloud to be seen. So the lady sat down at table. During the banquet, the little cloud gathered more vapour and spread over the sky. Suddenly there was an explosion. The lightning fell and struck the Duchess dead as she sat at table by her lord. Such is the story. As, however, she seems to have been alive in 1336, she must have used her charm pretty well for a good number of years of her married life. She and her husband were buried in the monastery church of Oberndorf, to which they had been benefactors. Most of the family were, however, buried at Owen, a little town dominated by the castle of Teck, and numbering about two thousand inhabitants. The chapel in which were the tombs of thirteen of the Dukes is, however, destroyed, and only one monument remains. The parish church is gone, the nave much earlier than the choir. A good number of old pictures, removed from the castle of Teck before it fell into complete ruin, are preserved in the town-hall.

The town held to the Swabian league in the sixteenth century, and stoutly resisted Duke Ulrich of Württemberg, who twice laid siege to it. The women armed themselves with hay-forks, and charged the men-at-arms and drove them from the gates. In reward for the prowess of the little town, it was granted special privileges by the Emperor.

The whole valley of the Lauter is rich with picturesque objects, and is full of interest. It was clearly at one time a perfect hive of knightly families, for almost every height is crowned with the remains of a castle. The valley is about twelve miles long, and ends at Gutenberg, that

lies somewhat overshadowed by the mountain walls in their very lap, near the source of the Lauter, that bursts forth from a grotto in the face of a cleft. A little way up the mountain side is a cavern, consisting of several chambers, that has never been thoroughly explored. In this, tradition says, sits a white lady with face cold and dead as the moon—so cold, that he who looks on her feels a chill strike to his heart. There she sits winter and summer, waiting her release; and that will not be till some good Christian shall venture to approach her and, without showing signs of fear, shall kiss her icicle-cold and colourless lips.

THE IVORY GATE.*

By WALTER BESANT.

CHAPTER II.—IN THE OFFICE.

'I'LL take in your ladyship's name. There is no one with him at this moment.—Oh yes, my lady,' Checkley smiled superior. 'We are always busy. We have been busy in this office for fifty years and more.—But I am sure he'll see you. Take a chair, my lady. Allow me.'

Checkley, the old clerk, had other and younger clerks with him; but he kept in his own hands the duty, or the privilege, of going to the private room of the chief. He was sixty-seven when last we saw him. Therefore, he was now seventy-five; a little more bent in the shoulders, a little more feeble; otherwise unaltered. In age we either shrivel or we swell. Those live the longest who shrivel; and those who shrivel presently reach a point when they cease to shrink any more till they reach the ninetieth year. Checkley was bowed and bent and lean: his face was lined multitudinously: his cheeks were shrunken: but not more so than eight years before. He wrote down the name of the caller—Lady Dering—on a square piece of paper, and opened the door with an affectation of extreme care not to disturb the chief's nerves by a sharp turn of the handle, stepped in as if it was most important that no one should be able to peep into the room, and closed the door softly behind him. Immediately he reappeared, and held the door wide open, inviting the lady to step in. She was young; of good stature and figure, extremely handsome in face; of what is called the classical type, and very richly dressed. Her carriage might have been seen, on looking out of the window, waiting in the square.

'Lady Dering, sir,' said Checkley. Then he swiftly vanished, closing the door softly behind him.

'I am glad to see you, Hilda.' The old lawyer rose, tall and commanding, and bowed, offering his hand with a stately and old-fashioned courtesy which made ladies condone his unmarried condition. 'Why have you called this morning?

* Copyright 1892 in the United States of America by Harper & Brothers.

You are not come on any business, I trust. Business with ladies who have wealthy husbands generally means trouble of some kind. You are not, for instance, in debt with your dress-maker?'

'No—no. Sir Samuel does not allow of any difficulties or awkwardness of that kind. It is not about myself that I am here, but about my sister, Elsie.'

'Yes? What about her? Sit down, and let me hear.'

'Well, you know, Elsie has always been a trouble to us on account of her headstrong and wilful ways. She will not look on things from a reasonable point of view. You know that my mother is not rich, as I have learned to consider rich, though of course she has enough for a simple life and a man-servant and a one-horse brougham. Do you know,' she added pensively, 'I have often found it difficult not to repine at a Providence which removes a father when he was beginning so well and actually on the high-road to a great fortune.'

'It is certainly difficult to understand the wisdom of these disappointments and disasters. We must accept, Hilda, what we cannot escape or explain.'

'Yes—and my mother had nothing but a poor thousand a year!—though I am sure that she has greatly bettered her circumstances by her transactions in the City. Well—I have done all I can, by precept and by example, to turn my sister's mind into the right direction. Mr Dering—by long habit Hilda still called her guardian, now her brother-in-law, by his surname—'you would hardly believe the folly that Elsie talks about money.'

'Perhaps because she has none. Those who have no property do not understand it. Young people do not know what it means or what it commands. And whether they have it or not, young people do not know what the acquisition of property means—the industry, the watchfulness, the carefulness, the self-denial. So Elsie talks folly about money—well, well!—he smiled indulgently—'we shall see.'

'It is not only that she talks, but she acts. Mr Dering, we are in despair about her. You know the Rodings?'

'Roding Brothers? Everybody knows Roding Brothers.'

'Algy Roding, the eldest son of the senior partner—enormously rich—is gone—quite gone—foolish about Elsie. He has been at me a dozen times about her. He has called at the house to see her. He cares nothing at all about her having no money. She refuses even to hear his name mentioned. Between ourselves, he has not been, I believe, a very steady young man; but of course he would settle down; we could entirely trust to a wife's influence in that respect: the past could easily be forgotten—in fact, Elsie need never know it: and the position would be splendid. Even mine would not compare with it.'

'Why does she object to the man?'

'Says he is an ugly little snob. There is a becoming spirit for a girl to receive so rich a

lover! But that is not all. She might have him if she chose, snob or not, but she prefers one of your clerks—actually, Mr Dering, one of your clerks.'

'I have learned something of this from your mother. She is engaged, I am told, to young Austin, one of my managing clerks.'

'Whose income is two hundred pounds a year. Oh! think of it! She refuses a man with ten thousand a year at the very least, and wants to marry a man with two hundred.'

'I suppose they do not propose to marry on this—this pittance—this two hundred a year?'

'They are engaged: she refuses to break it off: he has no money to buy a partnership: he must therefore continue a clerk on two hundred.'

'Managing clerks get more, sometimes; but, to be sure, the position is not good, and the income must always be small.'

'My mother will not allow the man in the house: Elsie goes out to meet him: oh, it is most irregular. I should be ashamed for Sir Samuel to know it. She actually goes out of the house every evening, and they walk about the square garden or in the Park till dark. It is exactly like a housemaid going out to meet her young man.'

'It does seem an unusual course; but I am no judge of what is becoming to a young lady.'

'Well—she needn't go on like a housemaid,' said her sister. 'Of course the position of things at home is strained, and I don't know what may happen at any moment. Elsie says that she shall be twenty-one next week, and that she means to act on her own judgment. She even talks of setting up a studio somewhere and painting portraits for money. That is a pleasant thing for me to contemplate. My own sister earning her own living by painting!'

'How do you think I can interfere in the matter? Lovers' quarrels or lovers' difficulties are not made or settled in this room.'

'Mr Dering, there is no one in the world of whom she is afraid, except yourself. There is no one of whose opinion she thinks so much. Will you see her? Will you talk with her? Will you admonish her?'

'Why, Hilda, it so happens that I have already invited her to call upon me on her birthday, when she ceases to be my ward. I will talk to her if you please. Perhaps you may be satisfied with the result of my conversation.'

'I shall—I am sure I shall.'

'Let me understand. You desire that your sister shall marry a man who, if he is not already rich, should be at least on the high-road to wealth. You cannot force her to accept even the richest young man in London unless she likes him, can you?'

'No. Certainly not. And we can hardly expect her to marry, as I did myself, a man whose wealth is already established. Unless she would take Algy Roding.'

'Very good. But he must have a certain income, so as to ensure the means of an establishment conducted at a certain level.'

'Yes. She need not live in Palace Gardens, but she ought to be able to live—say in Pembridge Square.'

'Quite so. I suppose, with an income of

fifteen hundred or so to begin with. If I make her understand so much, you will be satisfied?'

'Perfectly.—My dear Mr Dering, I really believe you have got the very young man up your sleeve. But how will you persuade her to give up the present intruder?'

'I promise nothing, Hilda—I promise nothing. I will do my best, however.'

Hilda rose and swept back her dress.

'I feel an immense sense of relief,' she said. 'The dear child's happiness is all I desire. Perhaps if you were to dismiss the young man immediately, with ignominy, and were to refuse him a written character on the ground of trying to win the affections of a girl infinitely above him in station, it might produce a good effect on Elsie—showing what you think of it—as well as an excellent lesson for himself and his friends. There is no romance about a cast-off clerk. Will you think of this, Mr Dering? The mere threat of such a thing might make him ready to give her up; and it might make her inclined for his own sake to send him about his business.'

'I will think of it, Hilda.—By the way, will you and my brother dine with me on Monday, unless you are engaged? We can talk over this little affair then at leisure.'

'With pleasure. We are only engaged for the evening. Now I won't keep you any longer.—Good-bye.'

She walked away, smiling graciously on the clerks in the outer office, and descended the stairs to the carriage, which waited below.

Mr Dering returned to his papers. He was not changed in the eight years since the stormy interview with this young lady's brother: his small whiskers were a little whiter: his iron-gray hair was unchanged: his lips were as firm and his nostrils as sharp, his eyes as keen as then.

The room looked out pleasantly upon the garden of New Square, where the sunshine lay warm upon the trees with their early summer leaves. Sunshine or rain, all the year round, the solicitor sat in his high-backed chair before his great table. He sat there this morning working steadily until he had got through what he was about. Then he looked at his watch. It was past two o'clock. He touched a bell on the table, and his old clerk came in.

Though he was the same age as his master, Checkley looked a great deal older. He was bald, save for a small white patch over each ear; he was bent, and his hands trembled. His expression was sharp, foxy, and suspicious. He stood in the unmistakable attitude of a servant, hands hanging in readiness, head a little bent.

'The clerks are all gone, I suppose?' said Mr Dering.

'All gone. All they think about when they come in the morning is how soon they will get away. As for any pride in their work they haven't got it.'

'Let them go.—Checkley, I have wanted to speak to you for some time.'

'Anything the matter?' The old clerk spoke with the familiarity of long service which permits the expression of opinions.

'The time has come, Checkley, when we must make a change.'

'A change? Why—I do my work as well as

ever I did—better than any of the younger men. A change?'

'The change will not affect you.'

'It must be for you then. Surely you're never going to retire!'

'No—I mean to hold on as long as I can. That will only be for a year or two at most. I am seventy-five, Checkley.'

'What of that? So am I. You don't find me grumbling about my work, do you? Besides, you eat hearty. Your health is good.'

'Yes, my health is good. But I am troubled of late, Checkley—I am troubled about my memory.'

'So is many a younger man,' returned the clerk, stoutly.

'Sometimes I cannot remember in the morning what I was doing the evening before.'

'That's nothing. Nothing at all.'

'Yesterday, I looked at my watch, and found that I had been unconscious for three hours.'

'You were asleep. I came in and saw you sound asleep.' It was not true, but the clerk's intentions were good.

'To go asleep in the morning argues a certain decay of strength. Yet I believe that I get through the work as well as ever. The clients do not drop off, Checkley. There are no signs of mistrust—eh? No suspicion of failing powers?'

'They think more of you than ever.'

'I believe they do, Checkley.'

'Everybody says you are the top of the profession.'

'I believe I am, Checkley—I believe I am. Certainly, I am the oldest. Nevertheless, seventy-five is a great age to be continuing work. Things can't last much longer.'

'Some men go on to eighty, and even ninety.'

'A few—a few only.' The lawyer sighed. 'One may hope, but must not build upon the chance of such merciful prolongation. The older I grow, Checkley, the more I enjoy life, especially the only thing that has ever made life happy for me—this work. I cling to it'—he spread his hands over the papers—'I cling to it. I cannot bear to think of leaving it.'

'That—and your savings,' echoed the clerk.

'It seems as if I should be content to go on for a hundred years more at the work of which I am never tired. And I must leave it before long—in a year—two years—who knows? Life is miserably short—one has no time for half the things one would like to do. Well'—he heaved a deep sigh—'let us work while we can. However, it is better to climb down than to be pulled down or shot down. I am going to make preparations, Checkley, for the end.'

'What preparations? You're not going to send for the minister, are you?'

'No. Not that kind of preparation. Nor for the doctor either. Nor for a lawyer to make my will. All those things are duly attended to. I have resolved, Checkley, upon taking a partner.'

'You? Take a partner? You? At your time of life?'

'I am going to take a partner. And you are the first person who has been told of my intention. Keep it a secret for the moment.'

'Take a partner? Divide your beautiful income by two?'

'Yes, Checkley. I am going to give a share in that beautiful income to a young man.'

'What can a partner do for you that I can't do? Don't I know the whole of the office work? Is there any partner in the world who can draw up a conveyance better than me?'

'You are very useful, Checkley, as you always have been. But you are not a partner, and you never can be.'

'I know that very well. But what's the good of a partner at all?'

'If I have a partner, he will have his own room, and he won't interfere with you. There's no occasion for you to be jealous.'

'As for jealous—well—after more than sixty years' work in this office, it would seem hard to be turned out by some new-comer. But what I say is—what is the good of a partner?'

'The chief good is that the House will be carried on. It is a hundred and twenty years old. I confess I do not like the thought of its coming to an end when I disappear. That will be to me the most important advantage to be gained by taking a partner. The next advantage will be that I can turn over to him a quantity of work. And thirdly, he will bring young blood and new connections. My mind is quite made up, Checkley. I am going to take a partner.'

'Have you found one yet?'

'I have. But I am not going to tell you who he is till the right time comes.'

Checkley grumbled inaudibly.

'If I had been less busy,' Mr Dering went on, 'I might have married, and had sons of my own to put into the House. But somehow, being very much occupied always, and never thinking about such things, I let the time pass by. I was never, even as a young man, greatly attracted to love or to young women. Their charms, such as they are, seem to me to depend upon nothing but a single garment.'

'Take away their frocks,' said Checkley, 'and what are they? All alike—all alike. I've been married myself—women are expensive frauds.'

'Well—things being as they are, Checkley, I am going to take a partner.'

'You'll do as you like,' said his servant. 'Mark my words, however; you've got ten years more of work in you yet—and all through these ten years you'll regret having a partner. Out of every hundred pounds his share will have to come. Think of that!'

'It is eight years, I remember,' Mr Dering went on, 'since first I thought of taking a partner. Eight years—and for much the same reason as now. I found my memory going. There were gaps in it—days, or bits of days, which I could not recollect. I was greatly terrified. The man whom I first thought of for partner was that young Arundel, now'—

'Who forged your name. Lucky you didn't have him.'

'Who ran away in a rage because certain circumstances seemed to connect him with the crime.'

'Seemed? Did connect him.'

'Then the symptoms disappeared. Now they have returned, as I told you. I have always regretted the loss of young Arundel. He was clever and a quick worker.'

'He was a forger,' said the clerk, stoutly.—'Is there anything more I can do for you?'

'Nothing; thank you.'

'Then I'll go. On Saturday afternoon I collect my little rents. Not much—in your way of thinking. A good deal to me. I hope you'll like your partner when you do get him. I hope I shan't live to see him the master here and you knuckling under. I hope I shan't see him driving away the clients.'

'I hope you will not see any of these distressing consequences, Checkley.—Good-day.'

The old clerk went away, shutting the outer door after him. Then the lawyer was the sole occupant of the rooms. He was also the sole occupant of the whole house and perhaps of the whole Square. It was three o'clock.

He sat leaning back in his chair, looking through the open window upon the trees in the Square garden. Presently there fell upon his face a curious change. It was as if the whole of the intelligence was taken out of it: his eyes gazed steadily into space with no expression whatever in them: the lips slightly parted, his head fell back: the soul and spirit of the man had gone out of him, leaving a machine which breathed.

The watch in his pocket ticked audibly: there was no other sound in the room—the old man sat quite motionless.

Four o'clock struck from the Clock Tower in the High Court of Justice, from St Clement's Church, from Westminster, from half-a-dozen clocks which could be heard in the quiet of the Saturday afternoon. But Mr Dering heard nothing.

Still he sat in his place with idle hands, and a face like a mask for lack of thought.

The clocks struck five.

He neither moved nor spoke.

The clocks struck six—seven—eight.

The shades of evening began to gather in the corners of the room as the sun sank lower towards his setting. At twilight in the summer there is never anybody to fear—man, woman, or cat—in the chambers, and at that hour the mice come out. They do not eat parchment or foolscap or red tape, but they eat the luncheon crumbs. Mr Checkley, for instance, always brought his dinner in a paper parcel in his coat-tail pocket, and ate it when so disposed, sprinkling crumbs lavishly—the only lavishment of which he was ever guilty—on the floor. Junior clerks brought buns and biscuits, or even apples, which they devoured furtively. Mr Dering himself took his luncheon in his own room—leaving crumbs. There was plenty for a small colony of mice. They came out, therefore, as usual; they stepped at sight of a man, an unwonted man, in a chair. But he moved not: he was asleep: he was dead: they ran without fear all about the rooms.

It was past nine, when the chambers were as dark as at this season of the year they ever are, that Mr Dering returned to consciousness.

He sat up, staring about him. The room was dark. He looked at his watch. Half-past nine. 'What is this?' he asked. 'Have I been asleep for seven hours? Seven hours? I was not asleep when Checkley went away. Why did I fall asleep? I feel as if I had been somewhere—doing something. What? I cannot remember. This strange sensation comes oftener. It is time that I should take a partner* before something

worse happens. I am old—I am old.' He rose and walked across the room erect and with firm step. 'I am old and worn out and spent. Time to give up the keys—old and spent.'

(To be continued.)

FLUORINE.

THE French chemist, M. Moissan, has compelled that extraordinary substance, Fluorine, to expose reluctantly to view nearly the whole of its secrets, and has published his discoveries in the October number of the *Annales de Chimie et de Physique*. For years the element completely baffled scientific investigation. Its energy and power of combination with other bodies was so intense, that nothing could induce it to forsake its union with them and appear in *proprid personâ*. Its hydrogen compound was discovered by Schwankhardt, a chemist of Nürnberg, as long ago as 1670, who first observed that the gas given off by a mixture of fluor-spar and oil of vitriol etched glass. All the figures on thermometers and barometers are now etched by this process. The glass is covered with a thin coat of white wax; and when all the necessary marks have been made by a steel point, the instrument is laid on a long leaden trough filled with the fuming mixture, and the gas eats into the glass wherever the wax has been removed.

In 1771, just one hundred years afterwards, the celebrated Scheele, to whom, among other things, we owe the vivid arsenical green which bears his name, and which, fortunately, is a much less frequent constituent of wall-paper than it used to be, contributed a work on Fluor-spar to the Memoirs of the Stockholm Academy, in which he stated that it was composed of lime and a new acid, named by him fluoric acid, which produced the etching on glass. This fluor-spar is one of our most beautiful minerals, and is variously known under the names of Blue John and Chlorophane, being found in considerable quantities both in Derbyshire and Cornwall. It possesses a glassy lustre, is more or less transparent, sometimes colourless, and perfectly so; but is, as a rule, beautifully tinted, presenting every variety of the purest and most exquisite shades of yellow, green, blue, and red. It crystallises in the cubical system. The crystals are large, and very frequently occur in the most remarkable and charming complications—an octahedron of one colour being in the middle of a cube of another, and so on. Muscalonga Lake, in Jefferson county, New York, was once a noted locality for these wonderful crystals. On its borders were found huge cubes of a greenish tinge, and sometimes more than a foot through, imbedded in granular limestone. Unlike most minerals, the colour is not produced by traces of foreign substances or by organic impurities, but seems to depend entirely on their physical structure. Connected with this is another curious phenomenon: when heated to just below redness,

the crystals exhibit a vivid phosphorescence; and still more curiously, the light emitted, which is of various tints, is perfectly independent of the external colour. If, however, the heat be carried too far, the phosphorescent power is lost, but may be restored to some extent by an electric current.

Scheele did not succeed in isolating the elementary constituents of his new acid; but it is really marvellous how accurate all his work was, when we come to consider that he was working at the time in Scharenberg's apothecary's shop with antiquated and primitive apparatus, and very little even of that. Three years before, Margraaf had attempted the analysis of fluor-spar, but without arriving at any result. It was not, indeed, until about fifty years afterwards that the composition of Scheele's fluoric acid was definitely fixed. Gay-Lussac and Thénard strove hard to prove, though unsuccessfully, that it contained oxygen; and it was Ampère who finally assigned the compound to its proper place in chemistry and named the element itself Phtor, or the destroyer, on account of its violent action. It was renamed Fluorine, as it had been first discovered in fluor-spar; and the hydrogen compound—Scheele's fluoric acid—was called Hydro-fluoric Acid.

Humphry Davy, in 1809 and 1813, tried, but without success, to isolate fluorine; and many earnest and gifted workers, both in our own country and abroad, followed on similar and different lines, only to meet with failure. It is probable that many of them did succeed in obtaining it for an instant in the free state, but it immediately attacked the glass or metal of the containing vessel and formed a fresh combination. Gore did a great deal of valuable work on it, trying to liberate it from its silver salt. He also made several investigations on the hydro-fluoric acid just mentioned and other compounds. Messrs Thorpe and Hambly have done much useful service in determining the physical constants of the same body, from which they were able to calculate the vapour density of fluorine itself; as has also M. Dumas by another method. Even in the end, the resources of chemistry alone proved unequal to the task, and it was by passing a strong current of electricity from twenty-six or twenty-eight Bunsen batteries through hydro-fluoric acid in which was dissolved a metallic compound to increase the conductivity, that M. Moissan, in 1887, was enabled to first obtain the element fluorine in a state of purity. Since then, he has considerably enlarged and improved his apparatus, which is now capable of turning out nearly four litres of the gas per hour. Every part of it is constructed of platinum with stoppers of fluor-spar, through which the wires conveying the current pass. The purifying vessels, tubes, and connections are also of the same metal, fastened together by nuts and flanges with lead-washers, which when acted on by the escaping gas, expand and seal any leak. As the price of platinum is two-thirds that of gold, the pecuniary sacrifices involved in the research are by no means insignificant. The U-shaped tube

in which the generation takes place is kept at a temperature of -9° Fahrenheit by the evaporation of a very volatile organic liquid contained in an outer vessel, and the first member of the purifying series at -58° Fahrenheit by the same means; the greatest care having to be taken that even the vapour of the refrigerating liquid does not enter any part of the apparatus, or else violent explosions occur.

Fluorine gas is of a yellow colour, with a smell resembling bleaching-powder. It has not been liquefied, and still remains gaseous at -140° Fahrenheit. Every precaution has to be taken in studying its action on other bodies, both on account of its dangerously irritating action on the eyes and mucous membrane of the operator; and its marvellous and wonderful energy, far exceeding that of anything hitherto discovered. There is hardly a gas, liquid or solid, that it does not attack, usually with the greatest violence; in fact, its mere contact with any other substance is nearly always signalled by the sudden evolution of intense heat and light and fierce detonations. It almost realises the fondest dreams of the alchemists, and might fitly be their long-sought Liquor Alkahest or universal solvent, for even dull inert flint takes fire instantly it is exposed to the vapour, and the whole mass becomes luminous with a grand incandescence. As a supporter of combustion it leaves oxygen far behind. Lampblack bursts immediately into brilliant flame and gets red-hot in a current of fluorine gas; and charcoal is made to give an interesting exhibition of its porosity by first filling its interstices with the gas and then burning spontaneously with sparkling scintillations. The diamond, however, is able to withstand its action even at high temperatures. Silicon, a crystalline substance closely resembling the diamond, gives a very beautiful reaction, showers of brilliant spangles being scattered in all directions from the white-hot crystals, which are finally melted. As they do not fuse under 2190° Fahrenheit, one can gain some idea of the immense energy set free during the combination. Both lime and chalk under the same circumstances give a most gorgeous incandescence. Phosphorus, as one might expect, does not fail to illustrate its powerful affinity when exposed to the gas. Prussian-blue reacts very beautifully, and burns with a pink flame. A crystal of iodine placed in a current of the gas gives a pale flame, and a heavy liquid distils over, which etches glass, and hisses like red-hot iron when thrown into water.

All the metals, with the exception of gold and platinum, are rapidly attacked by fluorine, and even these in less degree. Iron combines in the cold with splendid energy, becoming white-hot; and rust, when heated, behaves in a similar manner. Magnesium, aluminium, and many other metals, burn with great brilliancy, the combustion of the last named being especially beautiful. Zinc, if slightly warmed, bursts into gorgeous luminosity, accompanied by bright white flames so intense as to be almost blinding. Mercury is attacked violently in the cold. M. Moissan attempted on one occasion to pass a quantity of the gas into a tube standing over mercury protected by an inert fluid; but when inclining the tube, the two elements came into contact, there

was a violent detonation, and the containing vessels were broken to atoms. Copper, on the other hand, combines very quietly even when heated. This is rather curious, as, judging from its analogy in most points to lead and mercury, one would anticipate quite the opposite result. Silver requires some persuasion before it will take up fluorine, and very little action occurs until 212° Fahrenheit—the boiling-point of water—is reached. At a red-heat, however, incandescence is observed, the product melts, and on cooling, has a sheen like satin. Gold, on heating, forms a volatile fluoride, which, when carried to a slightly higher temperature, splits up again into the metal and the gas.

The behaviour of liquids with fluorine is usually very energetic, and experiments have to be conducted with much caution. If the gas be passed into the middle of alcohol, the result is very striking: the whole mass is violently agitated, and each bubble as it appears becomes incandescent in the middle of the liquid, finally vanishing in flame. A very similar reaction occurs with chloroform. If a few drops of this last liquid are shaken up in a tube full of fluorine gas, a violent explosion takes place, and the tube is reduced to fragments. An ingenious little apparatus was constructed for the study of the interaction of other gases with fluorine. It consisted of a fair-sized platinum tube provided with the necessary small tubes for the entrance and exit of the gases, and having at each end a window of fluor-spar, through which the phenomena occurring within could be observed. Hydrogen combines fiercely with fluorine even in the dark and at -9° Fahrenheit, the issuing stream burning with a blue flame bordered with red. In every other known case, heat or some form of extraneous energy is required to induce the combination of elementary gases. Some watchfulness was necessary to prevent back-pressure accumulating in the apparatus during these different experiments, as, if it did occur, fluorine was driven up the hydrogen limb of the generating tube, a violent detonation followed, and everything was shattered. Oxygen is one of the few bodies that appear to have no affinity for fluorine. Even when they are heated together up to 932° Fahrenheit, nothing is observed to take place between them. If a few drops of water are placed on the floor of the experimenting tube and fluorine gas is passed in, a dark fog is seen surrounding each drop, which presently clears and resolves itself into a characteristic blue vapour, apparently more than an inch in thickness, and which is found to be that most interesting condensed form of oxygen, ozone, in a state of great density.

Such are a few of the most beautiful and interesting results of M. Moissan's researches, and even a layman cannot fail to be struck by the marvellous and unprecedented manifestations of energy which the element seems capable of. The next problem for the consideration of chemists is, what reason can be assigned for this wonderful display of force? Why should these infinitesimal atoms rush together with such sound and fury? Is the heat and light evolved due to loss of rotatory motion, as if a whirling fly-wheel were brought suddenly to rest? or

what? It seems probable from recent discoveries in electrical science, which have a very close bearing on the subject, that we shall not remain much longer in ignorance.

SUNSTRUCK.*

CHAPTER XIII.

BURNS bent down and tried to raise Josephine to her feet, that he might lead her to a chair; but she resisted.

'No,' she said in a low passionate voice; 'you have not cast me down. It is he who has done this.'

'Yes,' said Greville sternly. 'It is I who have done this, by my charge; and it is I who should raise you up, and humble myself to you, child, but not yet—not yet.'

He turned and walked slowly to the door, to stand there with his back to them, waiting; and Burns followed almost directly, to turn before he passed out, and meet Josephine's eyes fixed upon his with a grateful look.

'It is impossible, Captain Greville,' he said in a quick angry whisper, as they approached Manton's room; but his host made no reply, merely going on before him with bowed head and a look of agony in his countenance which seemed to have aged him by ten years. They entered the room very gently; but Renée heard them, and started up to look piteously in her father's eyes; while Manton opened his, and gazed from one to the other questioningly, as if asking for help and relief.

Greville felt his head and hands, and then bent lower over him. 'Still in so much pain?' he whispered.

Manton made no answer but a smile, which told all; and the captain wiped the clammy dew from his temples.

'Can't—can't you do something?' came in a hoarse whisper.

'I am doing something,' said the captain; 'but we must wait. When did you drink that water?'

'Some time toward morning, I think—or was it morning?' said the sufferer faintly. 'I don't think I touched it in the night, and yet I seem to fancy I heard the glass strike against the vessel.'

'Yes: in the night,' said Burns quickly. 'I heard you.'

'No,' said Manton, after a few minutes' pause, during which he had struggled hard to bear a terrible paroxysm of pain—'no; I did not touch it in the night. I am sure it was morning.'

'He is wrong,' said Burns in a whisper to Greville. 'I distinctly heard him touch the bottle and glass.'

Greville looked from one to the other curiously, and then walked to the window, and stood there thinking whether there was anything he could do to help his guest.

As he left the bedside, Renée let her head sink again in despair, for she could gather no hope from the face before her; and once more a terrible silence fell upon the group; while Burns,

after looking intently at the pain-drawn countenance of his friend, crossed on tiptoe to speak to Greville, who was leaning out of the window, and seemed to be trying to reach something below him amongst the flowers which covered the top of the veranda and climbed up round the jalousies.

The next moment he was standing upright examining a kind of chaplet or necklace formed of the bright red seeds of the snake-wood.

'Have you seen this before?' he whispered to Burns.

'That? Yes. I have seen our nurse, 'Miramis,' wearing it constantly. Why?'

'The creeper is broken and torn down about the window,' said Greville hurriedly; 'and the person who did it seems to have dropped the necklace on the veranda top. What should you say it meant?'

'Some one must have climbed out.'

'Or climbed up,' said Greville excitedly.—'Come down with me. We can do nothing here.'

Puzzled and wondering, Burns followed him into the room where Josephine crouched upon the matting in the same attitude as that in which they had left her.

'Josephine, my child,' said Greville so sharply that the girl started up and looked at him wildly, 'whose is this?'

She took the necklace he held out, and Greville watched her closely as she replied: 'It belongs to 'Miramis.'

'When did you see it last?'

'Last night, I think, when she came to my window.'

'Ah!' cried Greville. 'She came to your window?—When?'

'It was when I went up to bed.'

'Why?—Tell me the truth.'

'I am telling you the truth,' said the girl coldly. 'She often comes to my window of a night. It is nonsense; but she thinks she is a wise woman, and she makes me tell her my troubles, and promises me that they shall all depart.'

'Hah!' said Greville sharply; 'and you told her of your trouble last night?'

Josephine was silent for a few moments.

'Why do you not speak, girl?' said Greville sternly.

'I was thinking,' said Josephine slowly. 'I was in so much trouble that I hardly know what I said. She told me, though, that my trouble should not last.'

'You foolish girl!' cried the captain angrily. 'I believe you innocent, child; but it is through you that this horror has been caused.'

'I—I—don't understand.'

'Then I will not explain.—Burns, come with me.'

The young man gazed at him wonderingly, and then followed him out into the garden, where the rough palm stem which supported the veranda beneath Manton's window showed traces such as would have been made by one who had climbed up. The piece of trunk was rugged with the great dry footstalks of the old palm-leaves, which had been left so as to form a support to the creeper that had been planted to run up, so that an ascent was easy enough, but not without

disturbing the clustering stems and leafage of a beautiful Bougainvillea, which was in several places broken and torn away.

'There is no doubt here,' said Burns sharply. 'Some one has climbed up by this post.'

'Yes,' replied Greville, as he bent down to examine the creeper; 'and look here; some of this has been clumsily thrust back. Here is a piece tucked in that has been broken right off.'

There was a hard, set look in Greville's face as he turned from the veranda.

'What are you going to do?' said Burns, who was startled by the fierce look in his companion's eyes.

'Do, boy? What would you do to the reptile you have fostered—to the half-savage creature you have fed and tended for years, when it has turned and stung you to the heart? Hunt it out and crush it.—Ah!' he added after a pause, 'it is not the first. Such a creature is not fit to live.'

He hurried Burns on to the densely wooded part where the cottages of the blacks were clustered. As they approached one of the best of the cottages, superior to the rest, and with the garden better kept, Greville uttered an ejaculation. 'I might have known,' he said. 'I was mad not to have had it destroyed.'

'What—what is it?' cried Burns.

'There it is,' said Greville bitterly, as he pointed to a good-sized tree rising behind the cottage—'the manchineel.'

Burns looked eagerly at the tree with its small apple-like fruit.

'A deadly Euphorbia, teeming with virulent poison.'

He was about to enter the garden, when a black woman came toward them from one of the cottages with a curious shrinking look.

'Where is Semiramis?' said Greville sternly.

'Don't know, massah. Tink she go to de house.'

'No: we have come from there. She is hiding.'

He went on, followed by Burns.

'I have been a father to these people,' said Greville angrily, 'and yet there is no one I can trust. That woman lies to me at once. They say anything to escape blame.'

He thrust open the door of the cabin and entered.

'Not here,' he said fiercely. 'But she shall be found. They will all try and hide her.'

'From love?'

'From hate. There is not a black in the island who will not help her, for fear that she should work some spell—in other words, drug food or the water, out of revenge.'

He hurried Burns to where the men and women were at work in his fields, and everywhere there was a shake of the head in answer to his questions. No one had seen 'Miramis that morning; and at last, faint with the heat, Greville turned back.

Burns followed him, and at the gate they were met by one of the black labourers.

'Yes: what is it?' cried Greville.

'Massah look for 'Miramis, dey say. She gone.'

'Gone?—Gone where?'

The man pointed to the sea.

'Rutus go fishin' dis mawnin', sah; and 'Miramis come down and shout to man wiv a boat; and he come ashore and talk, talk; and den 'Miramis get in de boat, and de man lif in um big bundle and set de sail and go right away.'

'Is this true?' cried Greville, catching the man by the throat.

'Oh 'ss, massah, all de troof. 'Miramis gone right away.'

'Ah!—and why?'

'Cause a buckra massah very ill.'

'That will do. Go!' said Greville; and the man, who was trembling in every limb, hurried away.

'Her confession of her guilt,' said the captain slowly.

'Then you will have her followed and punished for the crime?' said Burns.

'If he dies—yes. If I save him—no. The chances are that I should never have her found. The woman has the reputation of being a follower of Obeah; and, as I have told you, such as she are supposed to bring death to those who are their enemies, and the people fear them. No: we shall never see her more.'

Greville whispered to Burns to stay where he was while he went back to the room where Josephine was seated alone; and ten minutes passed before he returned, to sign to the young man to follow him to the bedroom, where, to all appearance, the minutes of Manton's life were drawing to a close.

CHAPTER XIV.

After a short stay, they left the room once more and went out into the garden.

'I cannot bear it, Burns,' cried Greville in agony. 'It will kill her too. I must do something.'

He stopped short, with his brow rugged and teeth set, thinking intently. Then, with a look of rage, he turned suddenly upon his companion.

'It was a lie,' he said—'I ought to have known—a beggarly, transparent invention; but it tricked me for the time.'

'I do not understand you, sir.'

'That black scoundrel, Brutus: she sent him with that tale to put me off the scent. She has not left the island, but is hiding in the woods.'

'But the man?—'

'I tell you they will all lie, and invent childish stories to save one another from punishment. I know them by heart. Come to the plantation again. I'll have the truth from them, or!—'

At that moment a low, deep-mouthed baying rose from beyond the house. 'Ah!' said Greville, 'he never lies! Come quickly. Now I shall know the truth.'

Burns followed him as he hurried to the far side of the house, where Renée's great heavy-chested Cuban bloodhound was chained, and which now rose up on its hind-legs and pawed and fought to get at its master.

'Down, Nep!—down, Nep!' he cried; and the dog crouched at once while his chain was slipped from his collar.

'But surely you are not going to hunt the woman, sir, with that savage beast?'

'I am not going to hunt a woman, sir, but a vile murderer. You need not be alarmed: a word from me is enough to restrain that dog.'

Burns was silent; and at a word, the dog bounded before them on their way back to the woman's cabin, about which several women were grouped as they approached; but all fled in horror at the sight of the dog.

Greville laughed bitterly. 'You see,' he said. 'One would think I hunted my people with this hound.—Here, Nep! In with you, boy!'

He strode right into the cabin, and after a few moments' consideration, snatched up a gown lying on the bed.

'Here, boy, here!' he cried, shaking the cotton dress; and the dog made a plunge, buried his head in it, snuffed about, and then barked.

Greville snatched up other articles of attire which lay about as if their owner had just made a change; and the dog tore at them, seized them in his powerful jaws, and shook and turned them over, growling and snuffing about.

'That will do now—steady!'

Greville took a leather thong from his pocket, fastened it to the dog's collar and led him to the door. 'Now,' he said, 'you will soon see.'

The dog tried to bound off, but settled down directly with its nose close to the ground, and led them in and out to one of the cottages, where a woman within set up a wild cry; but the dog came out again directly, and made for another, threading the narrow pathway quickly, and dashing through the low doorway at once.

'Hah!' cried Greville; 'that's good.'

The dog ran round the room, came out, and, nose down, made straight for the plantation, where a group of labourers stood to watch them approach; and as the dog paid no heed to them, but went on along a narrow path by a patch of cane-ground, they one by one left their work and followed at a distance.

'Another proof,' said Greville in a low voice; 'they tell me plainly that she has taken to the forest. They will follow us to see her taken.—Look at Nep.'

Burns was already watching the sagacious beast, which was straining hard at the thong as, with nose down, he followed a narrow winding track right in among the trees beyond the captain's clearings; and, forgetting the heat in his excitement, Burns hurried on behind in the dark overgrown track, one which was rarely used.

'Where does this lead to?' said Burns at last.

'To a kind of meeting-house in the forest. I never interfere with them in this. It is of no use. Tired?'

'No, I think not,' said Burns, who seemed to be endued with fresh strength. For the next hour neither spoke, but with the dog tugging silently at the thong, followed the path in and out among the trees, till, all at once a large roughly thatched hut blocked further progress, the path going in under the low doorway, and Burns's heart leapt to his mouth as the dog uttered a growl and bounded upon something dimly seen in the windowless shelter at the farther end.

'Hah!' ejaculated Greville as the dog seized what proved to be a gaily coloured handkerchief. 'We are on the right track.—Good dog!' he con-

tinued, patting the animal and taking the kerchief from his jaws.—'Seek her, then.'

The dog made a plunge forward through a screened opening at the back out into the forest again; but the path had ceased. There were, though faintly visible, footsteps on the moist earth, and the scent was strong enough for the dog to go on as rapidly as he could, with the shade growing less deep, the trees more open, and it was evident now that they were ascending a steep slope, but diagonally.

'She has made for the mountain,' said Greville quietly.

Few words were spoken in their breathless ascent, but from time to time the scent seemed so fresh, and the dog tugged so that Greville grew excited.

'Keep a lookout forward,' he said. 'We must be near her now. I want to run her down before she can reach the woods again.'

Blue sky above them, the glistening rocks at their feet, and, beyond the glorious green trees below, there was the dazzling sea; but they had no eyes for the beauty of the scene, but toiled panting on behind the dog, which now led them into quite a chaos of piled-up masses of lava, for they had reached a gap in the edge of the crater, and Greville uttered a cry of satisfaction as he drew Burns's attention to a curl of smoke rising up some little distance ahead.

'There she is,' he whispered.—'Quiet, Nep!—She has not heard us. Keep level with me now,' he continued; 'and as soon as we are close up, seize her. I'll hold the dog.'

It was a time of breathless interest as they drew nearer the softly rising vapour which betrayed the woman's halting-place, and, making every effort not to tread on the loose stones which promised to rattle beneath their feet, they gained the mouth of a hollow, out of which the smoke rose; but, to their surprise, the dog turned off to their left, and suddenly threw up its head, whined angrily, and snapped at a tiny curl of smoke which rose from between its feet.

'Sulphur!' cried Greville. 'Pah!'

Burns had already stepped aside, for he had inhaled the choking fumes which they could now see were escaping from cracks in the loose volcanic soil, upon which the vapour was being condensed in a pale yellow efflorescence.

'I thought we had run her down,' said Greville. 'Proofs that the old volcano is not quite dead.—Go on then, boy. We shall overtake her soon. She must have been here before, perhaps to fetch sulphur or to perform some mumbo-jumbo tricks to frighten the weak fools.'

For the dog was tugging to get on, and, after dragging them in and out amongst the huge vesiculated masses of pumice, bare of all vegetation and glistening in the sunshine, it suddenly made a dash downward for about a hundred feet, turned in at a broad cavernous rift in the mountain side, and then drew back, threw up its head, and uttered a deep-mouthed bay.

'Run to earth!' cried Greville excitedly. 'In with you, Burns, and bring her out. No: she is my servant. Hold the dog. I'll go.'

Burns, with his heart beating heavily, thrust his hand beneath Nep's collar, and held him fast.

This rift led into quite a little cavern, whose

interior was lit up by the sun; and there, not twenty feet from them, lay the figure of the black woman, apparently sleeping after her toilsome climb.

Greville pressed forward into the cavern, and staggered back, choking violently.

'Good heavens!' he ejaculated. 'I could not breathe. Burns!—that woman!'

He said no more, but turned his head to the sharply blowing breeze, took a deep inhalation, and then plunged into the cave, and staggered out dragging after him the body of the wretched woman, till he was a few yards from the opening, where he lowered her softly down.

'Dead?' gasped Burns.

'Yes. There must have been a fresh escape of fumes,' said Greville slowly. 'There has not been a cloud about the crater for months. Poor foolish wretch! She must have staggered in there, worn out, to lie down and rest, and been overcome.—Let us get back, and send the people to fetch her down.—Look!'

Burns gazed in the direction pointed out, and saw that about a dozen of the blacks had followed them at a distance, and were standing waiting for leave to come farther.

Ten minutes later Greville and Burns were toiling down the mountain, the latter beginning to feel an exhaustion against which he could hardly fight.

It was quite dark when they reached the plantation house; and upon Greville hurrying to the sick chamber, he found that there had been apparently but little change. Manton was gazing with a fixed stare in Renée's eyes, too much prostrated now to be able to struggle against the paroxysms. But as Greville approached, he read hopeful signs in his patient's face; and a couple of hours later, he drew a long deep breath, and whispered words in Renée's ear which made her start to her feet, fling her arms about her father's neck, and burst into an hysterical fit of weeping, just as a low wailing chorus came through the open window from the direction of the cabins of the blacks, which was answered by a mournful howl and the rattle of a chain.

Semiramis had been borne down from the mountain, and was being carried to her hut.

CHAPTER XV.—CONCLUSION.

The next morning dawned with Manton plunged in a deep sleep, which lasted for nearly twenty hours, and from this he awoke weak once more as a child.

But the convalescence was one long dream of happiness, from which he seemed to be rudely awakened one day by the return of the ship and the call back to duty.

'Yes,' said Greville, as the time for parting came. 'Some day, if Renée does not change her mind.'

Two years after, she was Commander Manton's wife; and the captain accompanied her and her young husband back to England, where he had elected to end his days. For the time had come when the dreamy plantation life had begun to pall, and he had found a successor in Burns, who quitted the service upon wresting a long withheld promise from Josephine that she would be his wife.

Ten years had passed away before the young people met again, and it was in answer to a question that Josephine said: 'I was a foolish girl, and knew no better than Renée. Yes, I loved him dearly. Then in a minute my love was turned to hate, and I told that wretched woman, as I told her all my troubles then. Yes, I hated him; but I would sooner have died than caused him pain, and if he had— There, say no more, dear; we are sisters and the past is dead.'

THE MONTH:

SCIENCE AND ARTS.

It will be remembered that at the beginning of last year an exploring party started on an expedition into Central Australia, one of the objects being an exhaustive scientific survey of those blank spaces on the map which lie between latitude fifteen and thirty degrees south, an area which hitherto has been unexplored. Another object in view was to search for traces of Ludwig Leichardt, whose party started on the same errand more than forty years ago, and has not since been heard of. The present expedition has now returned from their arduous journey, after having experienced many trials and privations. At one time they travelled for thirty-four days without finding water. The natives were friendly in most cases; but it was impossible to hold communication with them, because their language was not understood. Altogether, the expedition has not resulted in any great discovery; but it has certainly corroborated the previously known fact that Central Australia is a country so exceedingly arid that it must always remain sparsely inhabited. The party consisted of ten, and every credit is due to them for risking their lives in an expedition so full of peril. We are glad to know that the medical officer of the expedition was also a photographer, so that in time we may hope to see pictures of a region previously unknown to the white man.

The proposed Antarctic expedition, about which so much was heard a few months back, and which was to start this year at the joint expense of the Australian colonies and Baron Oscar-Dickson of Sweden, will, according to all accounts, not take place, owing to the want of interest shown by the Australians in the enterprise. Sir Thomas Elder promised five thousand pounds on certain conditions, Baron Oscar undertaking to give a similar sum, or to double that amount should it be necessary; but the Australian colonies have not contributed their far smaller share, so that, although Baron Dickson had actually selected the two ships suitable for the work, the scheme appears to have fallen through. There is certainly plenty of money in Australia which would have been devoted to the enterprise had it been brought before the people in a right manner; but it seems that the scientific men who advocated the expedition were not in touch with the people generally, and owing to this circum-

stance, the matter has, we trust only for the present, fallen into abeyance.

An interesting paper was lately read before the North British Association of Gas Managers on the subject of Gas Leakage. It is well known that a heavy percentage of the gas made is lost by leakage. In clay soils the pipes naturally are sealed more securely in the ground, and the loss is not so great; but in porous soils such as gravel, the loss to the gas companies is sometimes as much as seventeen per cent. of the total output. In the paper referred to, the author of which was Mr D. Robertson of Dunoon, the chief outlets for this unaccounted-for gas were pointed out. Beyond the general leakage from the mains, loss accrued from careless connections where the supply-pipe for the houses entered the main, chiefly due to bad workmanship. It was also stated that an old wet meter might, for want of water, fail to register at least one-fourth of the gas passing through it. Street lamps, it was stated, are a certain source of loss in every town, owing to a separate service-pipe being required for each, thus multiplying the number of connections to the main. Condensation has been supposed by some to account for a large proportion of the loss; but Mr Robertson, from direct inquiry, has found that this is not the case. The reader concluded by pointing out, that although the responsibility of the gas company ended when they delivered gas into the consumer's premises, it was politic to educate the consumer into the most economical and efficient way of using the gas for lighting, heating, and cooking. This course would surely lead to a larger consumption per householder, and would thus decrease the percentage of unaccounted-for gas.

A new kind of life-belt has been brought out in Prussia. It consists of a canvas bag stuffed with reindeer hair. This hair being hollow and containing air is lighter than cork, and has indeed sufficient buoyancy to sustain a weight of twenty-two pounds of iron in water, although the bag itself weighs only one-tenth of that amount. The material can be used for stuffing mattresses, seats of chairs, sofas, or can be utilised for clothing or travelling rugs. Should these various necessities be provided on board ship, there will be plenty of life-saving appliances at hand in case of need.

In a paper by the Principal of the Hawkesbury Agricultural College, New South Wales, it is stated that the climate and a great portion of the soil of Australia are well suited for the culture of the olive. An interesting description is given of the manner in which green olives are preserved. They are picked from the trees when full grown, but while perfectly green, and are handled as carefully as eggs, for if they are bruised, they soon become black and rotten. While green the olives contain gallic acid, and to remove the unpleasant acrid taste caused by it, they are steeped in an alkaline solution, such as lime-water or soda. When the alkali has had time to penetrate the fruit, which it does in about ten hours, they are soaked in clear water until all alkaline taste has disappeared. They are next put into brine, and are finally stored in air-tight receptacles for export.

The submarine volcano which some time ago

rose up out of the sea near the island of Pantelaria has disappeared. Such volcanic phenomena are not uncommon in volcanic districts, and their sinking is more easily accounted for than their appearance, for they are mostly composed of ash and similar materials, which are quickly acted upon by the ever-moving waters around them.

A new railway brake has recently been invented which has the advantage of acting upon the rails instead of upon the wheels. The brake comprises four blocks of the usual kind, which are furnished with soft iron shoes, and these are pressed on to the rails by the action of eccentrics. Sufficient power can be transmitted to these blocks to actually raise a locomotive or railway truck from the track, if necessary. The great advantage of the new system seems to lie in the fact that the wheel is not dragged along the rail, as it is by existing brakes, an action which often causes a slight flattening of the wheel. We trust this brake will be fully tested by the authorities, in order that it may be seen whether it has other advantages over those in present use.

Every now and then a report reaches us that some unfortunate has been poisoned by means of tinned foods, and the particular food to which the disaster is generally attributed is tinned fish. It is believed that the food is contaminated by means of the tin or lead in the solder becoming soluble in the acid liquor in which the fish is preserved. It is now reported that a wholesale merchant and importer of tinned salmon at Manchester has determined to pack fish for the future in glass receptacles. A glass jar of salmon which had been sealed for twelve months was recently opened, and the contents were found in a perfectly fresh condition. We may soon hope to see salmon preserved in this manner in the English market.

An ingenious apparatus called 'a Wreck Indicator' has recently been invented by an officer of the United States navy. The contrivance consists of a copper ball about eighteen inches in diameter, which is hollow, and is securely glued to a base plate by means of soluble cement. It is intended that this apparatus should be secured to any portion of the upper works of a ship, so that, if the vessel should founder, after a certain time the soluble cement would melt, with the result that the ball would be left free to float. It would thus rise from the sunken vessel to the surface; and as it has fastened to its lower part a reel with a line attached, it will remain anchored above the surface where the wreck occurred. By this means the exact spot would be indicated where the wreck had taken place, and the number of vessels which sail from port and are never again heard of would tend to be greatly reduced.

Many householders and manufacturers in this country have occasionally been inclined to envy the inhabitants of Pennsylvania and other districts where natural-gas wells abound; for this natural gas has been an unspeakable boon to all. Not only has it represented a vast saving of expense, but it has done its work without the dirt and dust inseparable from coal-fires. But there are indications that the gas is being exhausted. Some years ago the theory was broached

that the gas was still being formed in the earth; but this theory has been given up, and the general opinion is, that certain subterranean reservoirs originally charged with the gas are now being rapidly emptied; and the reign of coal-fires must be recommenced. But the people have been so used to gas, that they are now turning their attention to its artificial production by the volatilisation of oil; and it is said that several large manufacturing establishments in certain western cities of the States are making use of the method with good results. That the system is feasible has long ago been proved in isolated districts in our own country, and it is quite possible that it will in the future be further developed.

Of all road-vehicles ever contrived by man, surely the London cab is at once the most ugly, the most uncomfortable, and the one which is worst adapted to its purpose. It is astonishing that a conveyance of this kind should not long ago have been improved upon, and it is difficult for the uninitiated to explain the reason why. We are glad to learn that the Coach and Coach-harness Makers' Company are about to hold a competition for prizes among British subjects engaged in the trade and resident in the United Kingdom. Three prizes of thirty, twenty, and ten pounds are offered by the company for the best three models of an improved four-wheeled cab suited to the traffic of London. There are also other prizes offered for various vehicles, but the one that is quoted will be of most interest to the public generally. Detailed particulars of these competitions—the drawings and models pertaining to which must be delivered by the end of April next—may be obtained of the clerk of the company at Noble Street, London.

A paper was recently read before the Shipmasters' Society by Captain Froud, the subject being the Heating of Ships and their Cargoes, and the Waste of Heat in Steamers. After detailing the different kinds of cargoes which generated heat, among which were certain minerals such as copper, antimony ores, and coal; animal matter such as wool; vegetable products like cotton, jute, flax, coffee, sugar, &c., which will all generate heat if not well dried, it was pointed out that the heat of ships depended also upon the materials of which they were constructed and on their colour. He considered that passenger ships would be painted in light tints be rendered cooler, and those carrying frozen meats and petroleum would also benefit largely. It was also pointed out that all parts of marine engines where the maintenance of heat was essential should be painted of the lightest colours, and that railway companies would effect economy by using light-coloured paints for their locomotives. With regard to ships, damp cargoes should always be avoided, and full ventilation should be maintained, especially in dry weather.

It would seem that the rocket apparatus which has been so often used with grand results on our shores will fail when too much is expected of it. In the case of a recent wreck near Dover, the rockets failed to reach the distressed ship, although several were fired by experienced hands. A rocket has nominally a range of five hundred yards; but this is necessarily curtailed when the projectile has a head-wind to contend against.

It has a line to drag after it weighing forty-three pounds, and should that line be wet its weight is doubled. It is doubtful whether a more perfect rocket can be made, for the present pattern is the outcome of many experiments. Perhaps it might be replaced by some form of shot fired from a gun; but great care would be necessary in handling such an engine, in case life should be destroyed instead of preserved by it. The suggestion has been more than once made that ships should carry their own life-rockets, on the ground that in cases of shipwreck the wind is nearly always towards the shore, and the rocket would thereby have a much enlarged range.

An official Report states that the copper mines of the French Congo are likely to prove of extreme importance. At present, under native auspices they are worked in a very primitive fashion, the tools employed being of hard wood only. The ore is the beautiful green carbonate of copper known as malachite, which is procured from holes dug in the ground to a depth of about six feet. This ore is broken up, pulverised, and submitted to heat on a tray with charcoal, with the help of bellows, after which the metal is poured into sand-moulds. The entire district is said to be wonderfully rich in copper.

It is said that the use of the electric head-light for locomotives is becoming general on the railways of Indiana, and that many advantages are found in its employment. The arc-light is fed by a small dynamo worked by the engine itself at a very slight expenditure of steam. On a clear night the engine-driver can see for a mile ahead, so that if any obstruction were in his way he would have plenty of time to pull up even though he were travelling at a high speed. Collisions have already been prevented by the use of these head-lights.

A novel 'wonder of the deep' has recently been experienced by those who go down to the sea in ships. On the recent arrival of the British barque *Hesper* at San Francisco, the captain reported a strange occurrence which took place when the ship was at a distance of about seventy-five miles from the coast of Japan. A rumbling noise was suddenly heard, and the sea was agitated to such an extent that the waves broke over the deck. But the most terrible and unusual feature of the disturbance was that the water was boiling hot, and the crew had to remain in the rigging for five hours to avoid it, where they were half suffocated by the heat as well as by blasts of hot sulphurous gas which continually escaped from the ocean. We believe that this is the first recorded instance of a ship being caught in the actual embrace of a submarine volcano, for such the awful phenomenon evidently was.

The recent earthquake in Japan will probably be found to be one of the most severe ever recorded. There is little doubt that much of the terrible loss of life is due to the houses being built on exactly the same principles of construction as those which are observed in countries not subject to visitations of the kind. Again and again it has been pointed out that earthquake countries should adopt special plans of house construction, and in Japan itself much attention has been given to this subject. In the recent

earthquake, forty-one thousand houses fell, and in most cases buried or imprisoned their inhabitants, who were some of them slowly burned to death in the conflagration which followed. A house made of basket-work, could such an erection be contrived, would be the ideal residence for a country subject to earthquakes. It has also been suggested, and in some cases the idea has been carried out, that the dwelling should consist of a wooden house resting upon iron balls, so that when the dreaded shock came the edifice would merely roll to and fro upon its supports without breaking up.

An excellent paper was recently read before the Shipmasters' Society, London, by Mr William Allingham, on Ocean Meteorology. Mr Allingham urged strongly the necessity of gathering together carefully all the lessons that could be read from the aspect of sky and sea, and, so to speak, codifying them for the use of navigators. It is interesting to learn that, in the matter of sea-routes, 'the large Liverpool lines trading to New York have agreed among themselves to run their steamers on clearly defined outward and homeward routes in order to lessen the risk of collision end on between their own ships proceeding in opposite directions, to avoid fog and ice in the vicinity of the Banks of Newfoundland, and to spare the fishermen riding at anchor there.'

A HUNDRED AND THREE DAYS ON A DESERT ISLAND.

THE shipwrecked crew of the barque *Compadre*, eight hundred tons register, Captain Jones, bound from Calcutta to Talcahuano, Chili, recently arrived in New Zealand, after a series of remarkable adventures, having escaped the successive perils of fire and shipwreck, and the hardships of a prolonged sojourn on the bleak and desolate islands to the south of New Zealand, known as the Auckland Islands.

The vessel left Calcutta on the 22d of January, last year, bound for Talcahuano with a cargo of jute bags. All went well until the 16th of March, when a fire was discovered by the captain in the after-hold. The subsequent events are very well told in a clear and graphic narrative which the chief-mate, Mr F. Bates, has given of the affair. The captain, it appears, at once called all hands on deck to cope with the fire. Holes were cut in the cabin deck, and water was poured in incessantly from ten A.M. to six P.M., but without much result. Finding it impossible to extinguish the fire, the captain ordered his men to batten all down, and then shaped a course for the Benff, a harbour in the extreme south of the Middle Island of New Zealand, that being the nearest port. Before finally closing the hatches, several men tried to obtain bread from below, but were rendered insensible by the smoke, and had to be carried on deck. The attempt therefore had to be abandoned. The vessel made fair way until the night of the 18th of March, when to the peril of fire that of tempest was added. A furious westerly gale came down upon the ill-fated vessel, accompanied by terrific squalls. At seven A.M. on the 19th of March land was discovered on the

starboard bow, distant about twelve miles. It was very hazy at the time, and, owing to the fearful sea, the vessel laboured heavily. One tremendous wave swept the foresail and foretopmast staysail out of the bolt ropes, burst the fore-castle ports, smashed the scuttle forehatches, and swept the decks of everything movable. Worse than this, it burst in the cabin, thus giving air to the fire, which could not be prevented from breaking out, though immense quantities of water were flooded in. The men could not man the pumps, being washed away by the seas which continually broke on board.

It is almost impossible to imagine a situation of greater peril. The carpenter sounded the well and found eight feet of water in the hold. The vessel was rapidly sinking under foot, and it was quite impossible to lower the boats in such a sea. Only one hope remained, and that of the slenderest possible character. The land which had been sighted was the Auckland Islands, and the vessel was now to the windward of the North Cape. The captain therefore ordered the mainyard to be squared, and steered for the land in the hope of saving life. It must, however, have indeed seemed a forlorn hope in such an angry sea, with a rock-bound coast backed by precipitous cliffs towering hundreds of feet above the sea-level. Still, with the indomitable pluck and resolution of British seamen, those on board determined to make the best fight they could for their lives. Just before the vessel struck, oil was poured on the waters over the stern, which greatly reduced the violence of the sea; and then all hands hastened to the bow and hung on the bowsprit, waiting for the critical moment. Their coolness and prudence were rewarded with good fortune. The vessel struck with a great crash, every one making a jump for the rocks; and all got safely to land, although some were much bruised by the violence of the concussion. In ten minutes nothing of the vessel but loose wreckage was to be seen.

Although the men had safely reached land they were in a pitiable plight. The Auckland Islands in the winter are as drear and desolate a place as one can imagine. They are swept by furious tempests and almost incessant rain. They are the homes of such seabirds as love the storm; but except for the occasional visits of sealers or of a Government steamer searching for shipwrecked mariners, the islands see no trace of human life, save only, as in the present case, when shipwrecked seamen are cast upon their inhospitable shores. On several occasions the place has been the scene of disastrous wrecks. The *Invercauld*, *Grafton*, *General Grant*, and *Derry Castle* are the names of a few of the vessels which occur to the mind. In many cases the loss of life has been total and complete. In the case of the *Invercauld*, out of nineteen men who scrambled ashore, three only were rescued after twelve months of fearful suffering.

The surface of the islands for the most part is mountainous, and a great deal of it is covered either with dense bush or a wilderness of high tussock, standing in deep peat, almost equally impassable. The prospect which met the *Compadre* castaways therefore was by no means hopeful. They had of course been able to save nothing in the shape of food from the vessel, and

were barefooted and scantily clothed, each man having partially stripped, preparing for a swim for life. It so happened, however, that assistance in the shape of food and clothing was within their reach, although they were not aware of it, and only discovered the fact by a sad and curious accident, although it turned out fortunately for the bulk of them. After getting on the rocks, the whole ship's company climbed the cliffs, which, as already stated, were several hundred feet in height. They saw a mountain in the distance, and made straight for it, to get a better view of the island they were cast upon. They reached it with some difficulty, and looking round, saw a flagstaff close to the beach. They at once went towards it; but losing their way in the bush, and night coming on, they made for the nearest beach, where they found a few limpets and one little fish, which they divided into sixteen parts, one for each man. This scanty fare was greedily devoured, as they had only had one meal since the fire broke out, four days before. What stores were saved from the lazarette had been kept for the boats, and were therefore lost when the ship went to pieces. While the men were dividing their miserable meal, it was discovered that one of the seamen, named Peter Nelson, was missing. An attempt was made to find him; but the night was so dark that the attempt had to be given up. A miserable night was spent owing to the rain and snow, which fell incessantly. In the morning, they divided themselves into parties, and proceeded to search for Nelson, but with no success. In the course of their wanderings, however, they came upon a neatly-built hut, and on examining it, found that it contained a store of food and clothing. It was a dépôt, established by the New Zealand Government for the relief and succour of shipwrecked seamen cast upon the islands. By a strange oversight, however, the existence of such a dépôt is not mentioned in any of the shipping directories; and but for the fact of poor Nelson wandering away to his death in the bush, his comrades might never have hit upon the dépôt, and, like him, might have perished of starvation.

From a record in the hut, the castaways learned that the New Zealand Government steamer *Hinemoa* had visited the islands only a week before on her periodical cruise, and they made up their minds that they would have to make a prolonged stay on the islands before there was any chance of being rescued. Consequently, they had to be very careful with the food in the dépôt. There is scarcely any fish to be caught at the Auckland; and the castaways found that the seabirds and seals, which were comparatively easy to approach at first, became so wild after a week or so of contact with human beings that it was impossible to get near them. The shipwrecked people, however, found some goats and sheep, which had been placed on the island by the New Zealand Government. Of the former they caught three, and of the latter eight. The sheep never having been shorn were covered with very long fine wool, which also proved very serviceable to the men.

It is not necessary to enter into details of the life of the castaways on the islands. They suffered a good deal of pain and discomfort from

the exposure; but the Government stores preserved them from danger of absolute starvation, and they enjoyed fairly good health during their stay. On Monday the 6th of July, to their great joy, the sealing-schooner *Janet Ramsay* called at the islands; and the men having been there exactly one hundred and three days, were taken on board and brought to New Zealand. At the nautical inquiry which was held, the court, it is needless to say, adjudged that the wreck was entirely due to misadventure, and that the captain and crew had done all that was possible under the circumstances.

VANISHED DREAMS.

BEAUTIFUL stories, in shielings wild,
They told of the fairies when I was a child—
How with feet like the foam-bells, so light and fair,
They entered the dwellings of want and care;
And as morning dew melts off from the grass,
So the cloud of sorrow was sure to pass;
No blight on the crops which the fairies had blest,
For day they brought gladness, for night they brought rest.

Oh heart of my childhood! what vigils vain
Were mine as I watched for the fairy train;
But the feet of the fairies came not nigh;
No glimpse of their beautiful wings flashed by;
And the peasants said: 'Ah, they know too well
Where peace and gladness and riches dwell!
Wait—and if clouds darken over your sky,
Surely then will you see them nigh.'

Alas! for the home of our childhood days—
Its weed-choked gardens, its moss-grown ways—
I heard them tell how, one autumn night,
Over heather and moor flashed the weird corpse-light;
I heard them whisper: 'The fairies know—
O'er the homestead they love falls the shadow of woe;
The fire will be quenched, and the hearth be lone,
Ere the winter has past, or the March winds blown.'

The fires are quenched, and the hearth is lone;
Dear names are carved on the gray headstone;
Only, I think, in my heart remains
The echo of long-ago joys and pains;
The half-believed legends have passed away;
Life grew too real—they could not stay.
The earth-lights have faded—the night is drear;
But the stars of heaven were never so clear!

MARY GORGES.

* * TO CONTRIBUTORS.

- 1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.
- 2d. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3d. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the *writer's Name and Address written upon them IN FULL*.
- 4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

If the above rules are complied with, the Editor will do his best to ensure the safe return of ineligible papers.

NOTES ON BIRD-MUSIC.

TOWARDS the latter end of changeful April, when winter has been fairly conquered by the returning warmth, is the beginning of the full development of Bird-music. Then the stream of song from our native birds, which has been gradually increasing from the virtual silence of winter, is reinforced by the arrival of our summer visitors. For the silence of winter is only comparative, and all through the dreary season—except for short intervals when frost binds the earth in iron fetters—there is bird-music to be heard. The Robin sings all through the winter months, and every now and then may be heard his companion, the Wren. And it only requires a gleam of sunshine to call forth the music of the Missel Thrush in the very midst of storm and cold. It is one of the treats of January and February to hear him during one of these intervals. Taking his stand on the top of some tall tree, he will pour forth his cheerful notes with a fine ring of wild enjoyment—a determination to be happy in spite of circumstances. It is only a little spell of fine weather between the snow and sleet, or hard frost, of the season, and yet he sings as if spring and nesting-time were already here. There is in the song a resemblance to that of blackbird and song thrush, but it lacks the luxuriance of phrase—meet for the leafy luxuriance of its surroundings—which we hear in the former; nor has it the reiterated, exulting happiness of the latter.

And there is much less variety. The songs of the three great musicians of the Thrush family are clearly defined and distinct from each other, just as are their eggs and nests; and yet, without a little careful observation, most people will confound the missel thrush with the blackbird and song thrush, or mix all three in hopeless mental confusion. A useful point for those to notice who wish to learn their songs is that the missel thrush sings first. Neither song thrush nor blackbird sings so early in the year; and I think the song thrush begins before the black-

bird. The special characteristic of the Song Thrush is its habit of frequent repetition. The repeated part consists, rarely of one, usually of two, three, or four notes, and is given from three to six times in rapid succession; then, perhaps without a pause, another phrase—if the word may be used—is repeated in a similar way. One of the bird's favourite repetitions, of which he never seems to tire, may easily be interpreted: 'Cheer up, cheer up, cheer up;' and this may be taken as the keynote and purpose of his music.

Richness and variety characterise the Blackbird's song: we would recognise the tone even if he sang the song of some other bird. This has led to the terms silvery and fluty applied to it: 'The blackbird fluteth in the elm,' which recalls the mellow clearness of his music; 'The blackbird's silvery tones,' which suggests the full richness of his voice.

Most birds seem to possess more or less of the imitative faculty; and even the blackbird, which has such a distinct and wonderful song of its own, is sometimes a mimic. I have also heard the skylark take the last four notes of the chaffinch's song and repeat them several times in succession as a part of his own; but whether this was imitation or coincidence I will not venture to say.

But our great mimic is the Starling. He will imitate many of our common songsters, and has been known to whistle for a dog, &c. There is a time when the starling forsakes his familiar haunts on the top of the old house with that convenient hole in the masonry which he entered to his nest. We miss his frequent song, which he was wont to give us from the corner of the roof or from the adjacent tree. He has gone to the moors to recruit after the cares and fatigues of family life. There he associates with the plover and curlew, and on his return reproduces perfectly the wild cry of the latter. And by the succeeding spring he will not have forgotten it, although then very busy imitating the blackbird and thrush. His various imitative snatches are

intercalated with a peculiar guttural gurgling screaming of his own, accompanied by a shaking of wings and ruffling of neck feathers. There is something weird and mysterious about the starling as he sits giving utterance to these strange cries of his; there is even a touch of what is called 'uncanniness' in the North. 'Tha're an inwörd kind of börd,' remarked a Northumbrian pitman while gazing on one perched on a telegraph wire and giving vent to these peculiar sounds. And I think he meant to convey the idea that the starling is of a meditative turn, and knows a thing or two which he doesn't tell to everybody.

I have never experienced greater pleasure in the pursuit of ornithology than in learning the song of the Dipper. There is a special charm in the habits of the bird, and its haunts are among the loveliest of Nature's scenes. That it is so much less known than many others increases the fascination. For I find from my dippings into ornithological literature that this is so. Yarrell, for example, states that he had never seen a dipper alive; and that well-known naturalist, the Rev. J. G. Wood, states that he has only once found its nest and never heard it sing.

The dipper sings both early and late in the year. The first time I heard it was, I think, early in February. A dipper flying over the water disappeared beneath it, and came up again to settle on a stone at the edge of the stream. He sat there and sang, his almost insular rock splashed by the passing water—a pleasing song, sweet and cheerful, with its meet accompaniment of murmuring waters. A voice less rich and powerful than that of blackbird and song thrush, and less variety in the song, yet with a striking resemblance. There is the song thrush's habit of repetition, but less pronounced; while certain trills and turns recall to my mind the canary more than anything else.

A few hundred yards farther up the stream another sat on a stone washed by the frequent spray. His glorious white breast, set off by dark plumes, gleamed like snow while he poured forth his welcome notes. Another time a January walk down a rocky stream was enlivened by the cheery music of several as they winged their way over the water or settled on their favourite stones. And he may be heard in November, a time when there is little bird-music. As I wandered by the stream-side one hazy November day, the familiar gleam of white passed up the water before me. A dipper sat on a stone in mid-stream and cheered the November solitude with his music. And in December also, if the weather is mild, he may be heard.

There is an exhilarating wildness about the Curlew's cry, in harmony with the wild moorland where we usually hear him. There goes one sailing leisurely along on those great wings of his, uttering slowly his characteristic cry. Now he begins to descend, and the notes get quicker and shriller. They reach their maximum, and then he utters a few slowly, by way of finish.

Wonderful bird-music is to be heard from 'the swamp where hum the dropping snipe,' as we wander through their favourite marshy haunts during the breeding season.

It was long before I could identify the strange

sounds. But it was soon perceived to come from a bird flying round and round rather high in the air, and rising and falling alternately in its flight. Somehow or other, a line written by the poet Hogg, in which he speaks of 'the airy bleeter's rolling howl,' associated itself in my mind with this strange cry; I was convinced he was referring to the same bird. And then I found that the Snipe is sometimes called the bleeter, and the mystery was solved.

The peculiar sound emitted by the snipe during the breeding season is doubtless a thing very difficult to describe accurately; but I think no single word in our language comes so near to it as 'hum.' For my own part, if asked to describe the sound, I should say: 'Imagine the hum of the bee magnified very many times, and then mingled with a little of the peculiar tremulous stammering characteristic of the bleating of the lamb and kid.' This latter quality has led to the term 'bleeter,' applied to the snipe in Hogg's line, and to the French name, *chèvre volante*; also to the term 'lamming' used in Norfolk to denote its cry.

After wandering among the swamps many times during the breeding season listening to the strange sounds, and watching the airy ascending and descending curves, I was fast coming to the conclusion that the asserted bleating was a myth, or at least an exaggeration, when the resemblance struck me in a convincing manner.

Most diminutive and beautiful of our native birds is the dainty Gold-crest; not rare, but somewhat difficult to see on account of its small size and retiring habits. Away among the fir-tops, especially in the autumn, its shrill chirp draws attention to the tree-tops. But it is one of those deceptive sounds so difficult to follow. Now it appears to come from that tree in front; but when attention is directed there, it seems to come from behind. At last the bird is seen hopping briskly about among the higher branches of a larch-tree. Perhaps, if fortune favours, the song is heard also. But it is very low and soft, and therefore easily missed. The first time I heard it was from the middle of a thick hawthorn hedge, where I got a sight of the bird at the same time. On another occasion, the soft notes came from a fir-tree on a hazy November day.

A great contrast to these notes so sweet and low of the gold-crest is the song of another tiny bird, the Wren. Its song is loud and clear—a perfect little torrent of music. One of the most difficult of ornithological facts to realise is that it comes from such a tiny throat. The wren gets through its song in a somewhat business-like manner; he has something to say, and he says it right off.

The Larks are an interesting family of songsters. Chief among them is the familiar skylark, famous for its early rising. 'Stir with the lark to-morrow, gentle Norfolk,' says King Richard, when he would exhort his follower to make an early start.

To be urged to early rising by an appeal to the lark was one of the pet aversions of Charles Lamb. That we should go to bed with the lamb and rise with the lark was one of those popular fallacies which he exposed so humorously. And no doubt the lark is unconsciously early in this

matter of rising; yet it is good to hear it when the summer day is still young. And perhaps even Lamb, had he been able to enjoy the lark's music without rising from his couch and losing the thread of his waking dreams, might have even praised him for his early song. The little sea-side resort of Silloth, on the Cumberland coast, is a place where this refinement of enjoyment can be obtained. Its main street runs parallel with the Solway Firth, and between it and the sea is a strip of waste sandy ground covered with grass and wild-flowers, and diversified with hillocky sand links. Here larks abound, and all the summer day from early morn till evening fill the air with their melody. And in the very early morning we may, just awakened from slumber, lie and listen with open window to the sweet sounds which herald the summer day. Motion seems an essential part of the skylark's music, and so it is with others of the family.

In the song of the treelark we find a wonderful combination of the poetry of motion and the sweetness of melody. Sometimes he may be heard singing seated on the tree-top; but if watched, will presently be seen to rise into the air. He will ascend some twenty or thirty yards in silence, then turn and begin to sing. Slowly, with outspread wings, he returns, pouring out a succession of sweet notes: he reaches the tree-top, and finishes with a few notes of melting sweetness, long drawn out.

The song of the meadow-lark, inferior in tone and variety to the sky- and tree-larks, is yet one we love to hear. It is best when there are many together and they can be both seen and heard. I have heard them to greatest perfection on a Northern moor where dwarf birch grew among the heather, and graceful yellow globe flowers shed a golden glory around. Dozens of meadow-larks were rising on all sides, and descending, singing as they dropped slowly down, and making the air vibrate with their frequent notes. Their lively music was varied by the call of the cuckoo and the wild sweetness of the curlew's whistle.

THE IVORY GATE.*

By WALTER BESANT.

CHAPTER III.—THE SELECT CIRCLE.

At half-past nine on this Saturday evening, the parlour of the *Salutation Inn*, High Holborn, contained most of its customary visitors. They came every evening at eight: and they sat till eleven, drinking and talking. In former days every tavern of repute kept such a room for its own select circle; a club, or society, of habitués, who met every evening, for a pipe and a cheerful glass. In this way all respectable burgesses, down to fifty years ago, spent their evenings. Strangers might enter the room, but they were made to feel that they were there on sufferance: they were received with distance and suspicion. Most of the regular visitors knew each other: when

they did not, it was tavern politeness not to ask: a case is on record of four cronies, who used the *Cock* in Fleet Street for thirty years, not one knowing either the name or the trade of the other three. Yet when one died the other three pined away. This good old custom is now decayed. The respectable burgess stays at home, which is much more monotonous. Yet there may still be found a parlour here and there with a society meeting every evening all the year round.

The parlour of the *Salutation* was a good-sized room, wainscoted and provided with a sanded floor. It was furnished with a dozen wooden chairs, and three small round tables, the chairs disposed in a circle so as to prevent corners or cliques in conversation. Sacred is the fraternity, liberty, and equality of the parlour. The room was low, and, in the evenings, always hot with its two flaming unprotected gas jets: the window was never opened except in the morning, and there was always present a rich perfume of tobacco, beer, and spirits, both that anciently generated and that of the day's creation.

Among the frequenters—who were, it must be confessed, a somewhat faded or decayed company—was, to put him first because he was the richest, the great Mr Robert Hellyer, of Barnard's Inn, usurer or money-lender. Nobody quite likes the profession—one knows not why. Great fortunes have been made in it; the same fortunes have been dissipated by the money-lenders' heirs. Such fortunes do not stick, somehow. Mr Hellyer, for instance, was reputed wealthy beyond the dreams of the wildest desire. It was also said of him, under breath and in whispers and envious murmurs, that should a man borrow a five-pound note of him, that borrower would count himself lucky if he escaped with the loss of seventy-five pounds; and might generally expect to lose the whole of his household furniture, and the half of his income, for the rest of his natural life. To be sure, he sometimes had losses, as he said himself, with a groan; as when an unscrupulous client jumped off the Embankment, when he had not paid more than fifty pounds on the original five; or when a wicked man sold off his furniture secretly, in contempt of the bill of sale, and got clean out of the country with his wife and children. But on the whole he did pretty well. It was further said, by old clients, that his heart was a simple piece of round granite, for which he had no use, and that he made money out of it by letting it out at so much an hour for a paving mallet.

Mr Robert Hellyer was not a genial man or a cheerful or a pleasant man to look upon: he neither loved nor comprehended a jest: he never smiled: he kept his mind always employed on the conduct of his business. Every night—forgive the solitary weakness—he drank as much as he could carry. In appearance, he was red-faced, thick-necked, and stout: his voice was thick even in the morning, when he was under no compulsion to thickness: it was believed by his friends that his education had been imperfect: perhaps because he never gave anybody reason to suppose that he had ever received any education at all. To such men as Mr Hellyer, who every night take much strong drink and on no occasion whatever take any exercise, sixty is the grand

* Copyright 1892 in the United States of America by Harper & Brothers.

climacteric. He was, a year ago, just fifty-nine. Alas! he has not even reached his grand climacteric. Already he is gone. He was cut off by pneumonia, or apoplexy, last Christmas. Those who saw the melancholy cortège filing out of the narrow gates of Barnard's Inn, mournfully remarked that none of his money was taken with him, and asked what happiness he could possibly find in the next world, which he would begin with nothing—nothing at all—not even credit—an absolute pauper.

Mr Robert Hellyer sat on one side of the empty fireplace. On the opposite side, a great contrast to his coarse and vulgar face, sat an elderly man, tall, thin, dressed in a coat whose sleeves were worn to shininess. His face was dejected: his features were still fine: he was evidently a gentleman. This person was a barrister, decayed and unsuccessful: he lived in a garret in Gray's Inn. There are a good many wrecks at the Bar, but few quite so forlorn as this poor old man. He still professed to practise, and picked up a guinea now and then by defending criminals. On these casual fees he managed to live. His clothes were threadbare: it was many years since he had had a greatcoat: on rainy and cold days he had a thin cape which he wore over his shoulders. Heaven knows how he dined and breakfasted; every evening, except in the hot days of summer, he came to this place for light and warmth. Unless he was very poor indeed, he called for a pint of old and mild and read the day's paper. Sometimes he talked, but not often: sometimes one or other of the company would offer him a more costly drink, which he always accepted with all that was left to him of courtesy. Outside, he had no friends: they had all forgotten him or died—it is very easy for a poor man to be forgotten: he had no relations: they had all died, emigrated, and dispersed; the relations of the unsuccessful are easily lost. When he talked, he sometimes became animated, and would tell anecdotes of the Bar and of the time when he was called, nearly fifty years ago, by the Benchers of Gray's Inn. What had become of the hopes and ambitions with which that young man entered upon the profession, which was to lead him to the parlour of the *Salutation* and the company that gathered there—and to the bare and miserable garret of Gray's Inn, forgotten and alone?

Another man, also elderly, who sat next to the barrister, was a gentleman who sold an excellent business and retired, in order to betake himself more completely to toying. He drank in three taverns during the day. One was in Fleet Street, where he took his chop at three: one was near Drury Lane Theatre, where he dallied with a little whisky from five to nine: and this was the third. He was a quiet, happy, self-respecting, dignified old man. In the evening, he spoke not at all—for sufficient reasons: but he benevolently inclined his head if he was addressed.

Next to him sat a younger man, a solicitor, whose practice consisted of defending prisoners in the Police Courts. He had with him two friends, and he had a confident swagger, which passed for ability. Next to him and his friends was a house agent, who had been a member for an Irish borough: and there was a gentleman, whose wife sang in music halls, so that this

fortunate person could—and did—sit about in taverns all day long. His appearance was that of a deboshed City clerk, as he was. Not to mention other members of the company, Checkley was there, occupying a chair next to the money-lender.

Here he was called Mr Checkley. He came every evening at nine o'clock, Sundays included. Like the money-lender, he wanted his little distractions, and took them in this way. Here, too, he was among those who respected him, not so much on account of his public and private virtues, or for his eminence in the law, as his money. It is not often that a solicitor's clerk becomes a 'warm' man, but then it is not often that one of the calling deliberately proposes to himself early in life to save money, and lives till seventy-five steadily carrying out his object. If you are good at figures, you will understand how Mr Checkley succeeded. Between the ages of eighteen and twenty-five he had an income which averaged about seventy-five pounds. He lived upon fifty pounds a year. From twenty-five to thirty-five he made an average of one hundred and fifty pounds: he still lived upon fifty pounds a year. At thirty-five he was induced by prudential considerations to marry: the lady, considerably his senior, had a thousand pounds. She was even more miserly than himself, and in a year or so after marriage, she fell into a decline, owing to insufficient nourishment, and presently expired. On the whole he calculated that he was the better man for the marriage by a thousand pounds. From thirty-five to forty-five his income rose to two hundred pounds: it then for twenty-five years stood at three hundred pounds a year: at the age of seventy Mr Dering gave him four hundred pounds. Therefore, to sum up, he had put by out of his pay the sum of £11,675—and this without counting the compound interest, always mounting up from his investments, which were all of a careful kind such as he understood: tenement houses, of which he had a good number: shares in building societies: money lent on bills of sale or on mortgage. At home—Mr Checkley lived on the ground floor of one of his own houses—he grew more miserly as he grew older. The standard of luxury is not high when fifty pounds a year covers all: but of late he had been trying to keep below even that humble amount. He conducted his affairs in the evening between his office hours and nine at his own house, or among the people where his property lay. It was in the district, visited by few, lying east of Gray's Inn Road: his own house was in a certain small square, a good half of the houses in which belonged to him.

At nine o'clock he arrived at the tavern. Here his drinks cost him nothing. A custom had grown up in the course of years for the money-lender to consult him on the many difficult points which arise in the practice of his profession. He was one of those who like to have one foot over the wall erected by the law, but not both. In other words, he was always trying to find out how far the law would allow him to go, and where it called upon him to stop. With this view he schemed perpetually to make his clients sign bonds under the delusion that they meant a hundredth part of what they really did mean. And as, like all ignorant men, he had the most

profound belief in the power and the knowledge and the chicanery of lawyers, he was pleased to obtain Checkley's advice in return for Checkley's drinks.

It was a full gathering. The old clerk arrived late: he was gratified at hearing the ex-M.P. whispering to his friends that the new arrival was worth his twenty thousand pounds if a penny. He swelled with honourable pride. Yes. Twenty thousand pounds! And more—more. Who would have thought, when he began as an office boy, that he could ever achieve so much?

The money-lender, bursting with a new case, real or supposed, took his pipe out of his mouth and communicated it in a hoarse whisper.

'Suppose'—it began.

'Then'—Checkley replied when the case was finished—'you would lay yourself open to a criminal prosecution. Don't you go so much as to think of it. There was a case twenty-five years ago exactly like it. The remarks of the judge were most severe, and the sentence was heavy.'

'Ah!' The usurer's red face grew redder. 'Then it can't be thought of. Pity, too. There's a house full of furniture and a shop full of stuff. And a young man as it would do good to him just to start fair again. Pity.—Put a name to it, Mr Checkley.'

'Rum. Hot. With lemon,' replied the sage. 'You get more taste in your mouth, more up-liftin' for your heart, as they say, more strengthenin' for the stomach, better value all round for your money out of rum than any other drink that I know.'

At this point, and before the waiter could execute the order, voices and steps were heard outside the room. The voices of two men. That of one loud, eager, noisy. That of the other quiet, measured, and calm.

Checkley sat upright suddenly and listened.

'That is young Cambridge,' said the old barrister. 'I thought he would be here—Saturday night and all.' He smiled, as if expectant of something, and drank off the rest of his beer at a draught.

'Most distinguished Cambridge man,' whispered the ex-M.P. to his friends. 'Wanst a Fellow of Cambridge College. Great scholar. Ornament to any circle. Dhrinks like an oyster. Son of a Bishop too—Son of an Irish Bishop—Talks Greek like English. He'll come in directly. He's taking something outside. He's always half-dhrunk to begin, and quite dhrunk to finish. But he only talks the better—being Oirish. Most remarkable man.'

The voice of this distinguished person Checkley knew. But the other voice. That he knew as well. And he could not remember whose voice it was. Very well indeed he remembered the sound of it. Some men never forget a face: some men never forget a shape or figure: some men never forget a voice: some men never forget a handwriting. A voice is the simplest thing, after all, to remember, and the most unchanging. From eighteen till eighty a man's voice changes not, save that in volume it decreases during the last decade: the distinguishing quality of the voice remains the same to the end.

'Have a drink, my dear fellow.' That was the voice of the Pride of Cambridge.

'Thanks. I don't want a drink.'

Whose voice was it? Checkley sat up eager for the door to be opened and that doubt to be resolved.

It was opened. The two men came in first, the Cambridge man leading the way. He was a good-looking, smooth-faced man of thirty-two or so, with bright blue eyes—too bright—a fine face, full of delicacy and mobility, a high, narrow forehead, and quick sensitive lips; a man who was obviously in want of some one to take him in hand and control him: one of those men who have no will of their own, and fall naturally before any temptation which assails them. The chief temptation which assailed Freddy Carstone—it seems to stamp the man that his friends all called him Freddy—a Freddy is amiable, weak, beloved, and given to err, slip, fall, and give way—was the temptation to drink. He was really, as the ex-M.P. told his friends, a very fine scholar: he had been a Fellow of his college, but never received any appointment or office of Lecturer there on account of this weakness of his, which was notorious. When his Fellowship expired, he came to London, lived in Gray's Inn, and took pupils. He had the reputation of being an excellent coach if he could be caught sober. He was generally sober in the morning; often a little elevated in the afternoon; and always cheerfully—not stupidly—drunk at night.

'You must have a drink,' Freddy repeated.—'Not want a drink? Hang it, old man, it isn't what you want, it's what you like. If I only took what I wanted, I should be—what should I be? Fellow and Tutor of the college—very likely Master—most probably Archdeacon—certainly Bishop. Wasn't my father a Bishop? Now, if you take what you like, as well as what you want—what happens? You go easily and comfortably down hill—down—down—down—like me. Tobogganing isn't easier: the switchback railway isn't more pleasant. Always take what you like.'

'No—no, Freddy; thanks.'

'What? You've got ambitions still? You want to be climbing? Man alive! it's too late. You've stayed away from your friends too long. You can't get up. Better join us at the *Salutation* Club. Come in with me. I'll introduce you. They'll be glad to have you. Intellectual conversation carried on nightly. Romantic scenery from the back window. Finest parlour in London. Come in and sample the Scotch.—Not want a drink? Who ever saw a man who didn't want a drink?'

The other man followed, reluctantly—and at sight of him Checkley jumped in his chair. Then he snatched the paper from the hands of the ancient barrister and buried his head in it. The action was most remarkable and unmistakable. He hid himself behind the paper. For the man whom the Cambridge scholar was dragging into the room was none other than Athelstan Arundel—the very man of whom Mr Dering had been speaking that very afternoon: the very man whose loss he had been regretting: the man accused by himself of forgery. So great was his terror at the sight of this man, that he was fain to hide behind the paper.

Yes: the same man: well dressed, apparently, and prosperous—in a velvet jacket and a white waistcoat, with a big brown beard—still carrying himself with that old insolent pride, as if he had never forged anything: looking not a day older, in spite of the eight years that had elapsed. What was he doing here?

'Come in, man,' said Freddy again. 'You shall have one drink at least, and as many more as you like.—Robert, two Scotch and soda.—We haven't met for eight long years. Let us sit down and confess our sins for eight years. Where have you been?'

'For the most part—abroad.'

'You don't look it. He who goes abroad to make his fortune always comes home in rags, with a pistol in his coat-tail and a bowie-knife in his belt. At least we are taught so. You wear velvet and fine linen. You haven't been abroad. I don't believe you've been farther than Camberwell. In fact, Camberwell has been your headquarters. You've been living in Camberwell—on Camberwell Green, which is a slice of Eden, with—perhaps—didn't pretty Polly Perkins live on Camberwell Green?—for eight long years.'

'Let me call upon you in your lodgings, where we can talk.'

'I haven't got any lodgings. I am in Chambers—I live all by myself in Gray's Inn.—Come and see me. I am always at home in the mornings—to pupils only—and generally at home in the afternoon to pupils and toppers and Lushingtons.—Here's your whisky. Sit down. Let me introduce you to the company. This is a highly intellectual society—not what you would expect of a Holborn Parlour. It is a club which meets here every evening—a first-class club. Subscription, nothing. Entrance fee, nothing. Order what you like.—Don't pretend not to know your brother-members.—Gentlemen, this is my old friend, Mr Athelstan Arundel, who has been abroad—on Camberwell Green—for the sake of Polly Perkins—for eight years, and has now returned.'

The ex-M.P. nudged his friends to call their attention to something good. The rest received the introduction and the remarks which followed in silence.

'Arundel, the gentleman by the fireplace, he with the pipe—is our Shylock, sometimes called the Lord Shylock.' The money-lender looked up with a dull and unintelligent eye: I believe the allusion was entirely above his comprehension.—'Beside him is Mr Vulpes—he with his head buried in the paper—you'll see him presently. Mr Vulpes is advanced in years, but well preserved, and knows every letter of the law: he is, indeed, an ornament of the lower branch. Vulpes will let you a house—he has many most charming residences—or will advance you money on mortgage. He knows the law of landlord and tenant and the law regarding Bills of Sale. I recommend Vulpes to your friendly consideration.—Here is Senex Bibulus Benevolens.' The old gentleman kindly inclined his head, being too far gone for speech. 'Here is a most learned counsel, who ought, had merit prevailed, to have been by this time Lord Chancellor, Chief Justice, Judge or Master of the Rolls, or Queen's Counsel at least. So far he is still a Junior, but we hope for his speedy advancement.—Sir, I entreat the

honour of offering you a goblet of more generous drink.—Robert, Irish whisky and a lemon for this gentleman.—There'—he pointed to the ex-M.P., who again nudged his friends and grinned—'is our legislator and statesman, the pride of his constituents, the darling of Ballynacuddery till they turned him out.—There'—he pointed to the debosched clerk—'is a member of a great modern profession, a gentleman with whom it is indeed a pride to sit down. He is Monsieur le Mari: Monsieur le Mari complaisant et content.'

'I don't know what you mean,' said the gentleman indicated. 'If you want to talk Greek, talk it outside.'

'I cannot stay,' said Athelstan, looking about the room with scant respect. 'I will call upon you at your Chambers.'

'Do—do, my dear fellow.' Athelstan shook hands and walked away. 'Now, there's a man, gentlemen, who might have done anything—anything he might have done. Rowed stroke to his boat. Threw up everything eight years ago and went away—nobody knew why. Sad to see so much promise wasted. Sad—sad. He hasn't even touched his drink. Then I must—myself.' And he did.

Observe that there is no such lamentation over the failure of a promising young man as from one who has also failed. For, by a merciful arrangement, the failure seldom suspects himself of having failed.

'Now, Mr Checkley,' said the barrister, 'he's gone away and you needn't hide yourself any longer—and you can let me have my paper again.'

Mr Checkley spoke no more that evening. He drank up his rum-and-water, and he went away mightily perturbed. That Athelstan Arundel had come back portended that something would happen. And like King Cole's prophet, he could not foretell the nature of the event.

INSTINCT.

ON the threshold of this subject we are met by the difficulty of defining the term. Darwin says: 'An action which we ourselves should require experience to enable us to perform, when performed by an animal, more especially by a very young one without any experience, and when performed by many individuals in the same way, without their knowing for what purpose it is performed, is usually said to be instinctive.' All writers on the subject agree that Instinct exists prior to all individual experience, and is in a state of perfection from the very first.

The biological law by which all living creatures tend to repeat themselves is called heredity, and by well-ascertained facts it extends over all the functions of the organisms, both internal and external, and the most unobservant must be aware of this truth. From the lowest organisms to the most highly developed, each animal receives from its parents certain kinds of senses. In the formation of instincts, heredity reigns supreme, for it conserves and accumulates, thus producing stability, and fixing what at first was acquired and variable. Longevity is not

due to climate, race, or the care we take of ourselves, but to heredity, and life-assurance offices recognise this fact by asking the age at death of our ancestors.

Immunity from contagious diseases, muscular strength, energy, stammering, lisping, loquacity, harelip, insanity, phthisis, &c., are all transmitted. Habits are transmitted; and Darwin gives a well-marked case which came under his notice of a man who moved his fingers in a peculiar manner when excited, and who transmitted the trick to his eight children. Blumenbach avers that 'an injury such as a badly-set finger may be inherited.' The Eskimos cut off the tails of their dogs, and the pups are often born tailless. Manx cats, which have no tails, are supposed to have had a similar origin. Accidental modifications, however, tend to return to the normal type and are not perpetuated. Instincts are not rigid, but admit of modification, and are plastic in adapting themselves to changed conditions in the life of the individual, and also in the life of the species, whenever these variations exist for so lengthened a period as to call into operation the laws of heredity.

The two great causes of variability are—external surroundings and domestication; and it is by the latter that the action of man is more powerful to effect changes than Nature; for, as hereditary modifications occur frequently, man, through selection, is able to accumulate these slight variations, and thus produce a new variety, which will tend to propagate its new form. Wheat, which is one of our oldest cultivated plants, still yields new varieties; and our oldest domesticated animals are capable of fresh modifications. Domestic instincts are by some said to be long-continued and compulsory habits which have become transmitted; but this cannot be altogether true, for the teaching of a dog to point would have occurred to no one had not some dog shown a well-marked tendency, and which, after all, would merely have been an exaggeration of the attitude of animals about to spring on their prey. Instincts are unconscious forms of intelligence. The white butterfly will lay her eggs on the cabbage plant, but she cannot know why she does it. A young squirrel has its store-house before it can have any experience of winter, and a duckling will make for the water although hatched by a hen. Instinct never compares or judges, but advances with certainty to its goal. The cuckoo places her eggs in other birds' nests because she lays them at intervals of three days, and were she to sit on them the hatching would be too prolonged, as there would be eggs of different ages in the same nest, and as she migrates at a very early period few young would in consequence be reared. In America, as a rule, the cuckoo hatches her eggs, but occasionally she adopts the plan of her European cousin, and probably in time will adopt it altogether. The young cuckoo has the instinct to thrust out of the nest its foster-brothers in order that it may get sufficient food. This act was probably caused in the first place by unintentional restlessness, which was improved upon and transmitted.

Organic instincts are sometimes lost under domestication, as we see in young chickens which have lost that fear of dogs and cats which

must originally have been instinctive in them; and there are some breeds of fowls which have lost the sense of sitting on their eggs. In incubation it is difficult to conceive that the animal could have had any intelligent idea of hatching the contents of the eggs, and it was probably due to the feeling of protection; those that cuddled their eggs most would have a larger offspring, and the instinct would thus be developed by natural selection. Even after a lengthened period of domestication natural instincts will persist, as is seen in the ass and the camel disliking to cross streams of water, both animals having originally come from desert countries where water is scarce. Lambs will skip on the smallest hillock, and this is a relic of their former Alpine habits. It is related of a little dog that an old piece of wolf-skin having been placed before it, the animal was convulsed with fear—a fact which can only be explained by the hereditary transmission of dread of that animal.

Acquired instincts are transmitted, but it takes about four generations to fix them. Without the heredity of acquired instincts, man in attempting to domesticate animals would have laboured in vain. The pups of pointers, collies, retrievers, and spaniels will act as their ancestors have done when taken out for the first time. A young fox in a country where they have been much persecuted will show more cunning on first coming out of its hole than an old one living in the midst of less dangerous surroundings. Large birds in inhabited lands are more shy than small ones, simply because they are more shot at, whereas in uninhabited countries they are equally fearless. Some instincts are stronger than others, and we may frequently observe the struggle going on between them, as when a dog rushes after a rabbit, is rebuked, hesitates, pursues again, or returns to his master; or when a bitch hesitates between following her owner or returning to her pups. The maternal instinct is strong in all animals, and yet it has to yield to the migratory, the offspring being left to perish miserably. It may be mentioned that birds when migrating fly as a rule by night, and in some species the young ones do not accompany the older, and must therefore perform their first journey, sometimes over immense tracts, without guidance. Darwin suggests that migration is due either to the feeling of pleasure or pain, or is the result of the force of inheritance. Audubon relates the case of a pinioned goose starting at the proper moment on foot for its long journey.

Every variation of instinct that places an animal in a better position to defend itself against new enemies or to seize some new prey is a clear gain, and will render it likely to survive under more complex surroundings. The grouse of North America burrow a tunnel just below the surface of the snow, sleeping securely at one end, and when any enemy approaches the mouth, the bird to escape has only to fly through the thin covering of snow. This action was probably due originally to the craving for warmth or concealment, or both, and the birds making the longest tunnel would be more easily survive, and thus the instinct would be perpetuated by natural selection. A plover with a brood

will, when frightened, pretend to be wounded, thus drawing the attention on herself while her young escape. This action was an intelligent one at first, due to the strength of the maternal feeling. Those parents who adopted this plan would raise a larger number of young than the more stupid, and when in time the young birds became mothers, the tendency to act in a similar manner would be transmitted.

It is not a universal law that each organ and tissue of the animal has a special function, and that from these are developed the instincts. If it were true that from the physical form the mental form arose, and that the organisation corresponded exactly with the instincts, each time the organisation differed the instincts would also vary; but this is not the case, for American and European beavers are alike outwardly, but the one builds and the other burrows. Spiders have the same organs for weaving their web, but the methods adopted are different, and some do not weave at all but merely live in holes. Certain species of wasps lay up a store of spiders to feed their larvae, and to enable them to do this the spider is stung on a certain spot, so that it is not killed outright but merely paralysed, and is thus kept without decomposing until the young are hatched. This is the result either of instinct or of the form of the wasp being such that the sting naturally strikes the proper spot.

In the following remarks on ants we have derived our information chiefly from Sir John Lubbock's book on the subject.

It would be a serious error to believe that all instincts are due to habits acquired in one generation, and transmitted by inheritance to another, for some of the most wonderful instincts could not have arisen in this manner, as, for example, those of the working or sterile ant. These differ greatly in structure and instinct from the males and fertile females, yet, from being barren, they cannot have progeny. Again, the neuters differ not only from the fertile males and females, but from each other to such a degree that three castes sometimes exist. Westwood states that 'the inhabitants of the nest have the instinct so to modify the circumstances producing this state of imperfection that some neuters shall exhibit characters at variance with those of the common kind.' This credits them with a wonderful instinct, but it is the most probable explanation. Bees have the power, by difference of food, &c., of obtaining at will from the same eggs either queens or ordinary workers, and it is possible that ants act in like manner. In them we have animals so highly endowed that they may fairly claim to rank second to man in the scale of intelligence. They make roads so as to clear obstacles from their path; when necessary, they tunnel, and an observer in South America states that he has seen one under a river as broad as the Thames at London Bridge. They possess milch-cows (aphides), which they carefully tend and protect; for the winter, they lay up a store of provisions; they engage in sportive exercises, take part in mock-combats, and play hide-and-seek. Certain individuals of a genus found in Mexico serve as 'animated honey-pots' through having their abdomens greatly dilated. In some countries they thatch the entrances to their subterranean homes, thus pro-

tecting themselves from rain; while in others, leaves are used to form beds for mushrooms, which they cultivate and eat. In Texas, some plant, harvest, and store rice; and on these rice-fields nothing else is allowed to grow. Should the grain get wet it is brought up and dried.

The slave-making ants have been brought into a state of degradation through their weak nature; for they have lost their power of building, their domestic habits, their industry, and even the habit of feeding, as, when placed in the midst of plenty, they will rather starve than help themselves. The origin of slave-making must have arisen through the pupæ of other species stored as food becoming developed, and the foreign ants following their proper instinct, immediately proceeded to work, and in course of time, instead of collecting pupæ as food, they would store them for the sake of rearing slaves. It is possible that these slave-making ants will in the battle of life cease to survive, making way for others which have reached a higher stage of civilisation.

Ants removed from the nest in a state of larvæ will, if nursed by friends, be readmitted to the nest from which they were taken; and the result is similar even when they are tended by strangers. The pupæ of one nest tended by ants from another nest will, if placed when hatched in the nurse's nest, be savagely attacked. It has therefore been supposed that each nest must have a special signal or password; but we think the recognition must be due to smell; and although it is difficult to believe that each nest has a separate odour, yet we must remember that each human being possesses an odour peculiar to himself; for, otherwise, dogs could not track the footsteps of their masters.

The different species of ants present different conditions of life, curiously resembling the earlier stages of human progress. The '*Formica fusca*' live principally on the produce of the chase; they frequent woods, live in small communities, and hunt singly; their battles are single combats like those of the Homeric heroes. These ants probably retain the habits common to all ants. They resemble the lower races of men who subsist mainly by hunting. The '*Lasius flavus*' are a higher type; they have greater skill in architecture, and own domesticated milch-cows; their communities are larger, and they act in concert. They resemble pastoral man, who lives on the produce of his flocks and herds. Lastly, the harvesting ants represent the agricultural nations.

Whether there is or is not an absolute difference between instinct and intelligence is a moot-question. According to Herbert Spencer, instinct is but one of the first stages in the ascending evolution of the mind, and there is no real difference between instinct, memory, reason, &c.—these names being useful as a convenient method of grouping phenomena. Instinct is variable, so is intelligence. The latter is, as a rule, conscious, but sometimes becomes unconscious; and it is possible that the loftier instincts in the higher animals are accompanied by a confused consciousness. Actions which are frequently repeated become automatic—that is, instinctive or unconscious; one movement follows another in a sort of rhythm. If any one is

interrupted when reciting, he has to go back to recover the thread; so a caterpillar, if it has completed its hammock up to the third stage and is placed in one finished to the sixth, is unable to derive any benefit from the fact, for it has to go back to the point where it left off, and thus does work already completed.

The state of somnambulism is nearly akin to instinct in that the acts performed are unconsciously done, and are habitual ones: the poet writes verses, the musician composes music, and the philosopher describes philosophy. Cuvier says: 'We can gain a clear notion of instinct only by admitting that animals have in their sensorium images or constant sensations, which determine their action as ordinary and accidental sensations determine action in general. It is a sort of dream or vision which haunts them constantly; and so far as concerns their instinct, animals may be regarded as a kind of somnambulist.'

The mental faculties of animals have been described as instinctive, while those of man have been termed rational. Instinctive actions are mechanically performed; rational actions require a conscious effort of thought, and with thoughtful adaptation of means to ends. That man possesses certain instincts in common with the lower animals is admitted; but that animals possess reason in common with man is warmly denied. Modern discoveries all tend to prove that man is evolved from the animal kingdom. The comparative anatomy, physiology, and psychology of man and the other animals show how closely they are connected in conformation, organs, and functions; paleontology, the transformations and transitions of forms, and embryogeny, reveal the lower type whence they were evolved. The gaps between the fossil fauna and flora are important, but proofs are accumulating daily in support of this theory.

The perceptions act in the same way; the imagination and the emotions are likewise identical. The higher animals may be regarded as an undeveloped form of man; while man may be called a complex animal. One great cause of the difference between the reason of man and the reason of animals seems to be the fact that man possesses speech; and by speech we do not mean the mere faculty of articulating words, but that each word shall be a sign representing an idea. Deaf mutes reach a high stage of abstraction by means of an elaborate series of signs; parrots articulate, but do not understand what they say. It is true that animals are able to communicate with each other. The bark and the howl of the dog signify by their difference very different things; the fowl has a note for excitement, a cluck for maternal anticipation, and a shrill cry for warning.

'Intelligence,' says Ribot, 'is a mirror which reflects the universe. It is a wonderful instrument, and is in some cases infinite as the world itself which it encompasses and measures. By the accumulated progress of generations it tends to correspond more perfectly with its object. In its development through time and space and through the infinite variety of living creatures, it ever pursues its ideal—that is, to comprehend all things from common phenomena up to the eternal and sovereign laws of the Cosmos. In-

stinct is much more humble; it reflects the world only at a small angle; its relations are limited; it is adapted to a restricted medium; it is fitted only to a small number of circumstances. Instead of being an immense palace, whence a boundless horizon may be seen, it is a lowly cottage with only one window. But if we look at both, instinct and intelligence, from without, their processes are the same.' C. T. E.

URGENT PRIVATE AFFAIRS.

By RICHARD DOWLING,

AUTHOR OF 'THE MYSTERY OF WILLARD,' 'THE WEIRD SISTERS,' &c.

IN FOUR CHAPTERS.

CHAP. I.—CROCODILES OF THE THAMES.

'I—I beg your pardon,' said a hesitating male voice.

The girl started, looked round, but saw no one.

'I'm on the wall,' said the male voice in apologetic tones.

She cast her eyes up. The head and shoulders of a light-haired young man, clad in flannels, appeared almost directly over her.

The young man mounted a rung higher on the ladder and said: 'I hope I haven't startled you? I was looking for something I had lost when I saw you. I spoke because I thought you might be frightened if you came on it unawares.'

'What is it?' she asked with great dignity, stepping back a pace, and tilting her cream-coloured umbrella further back over her dainty shoulder.

'Only my crocodile, Jacko.'

'What!' she cried, gathering her dress together and glancing round the ground with apprehension.

'Indeed,' said the young man penitently, 'you must not be alarmed. He's quite tame and very small, and he's almost blind. I bought him cheap—a damaged lot,' he added, laughing, to reassure the girl.

She looked at him in silent indignation. She was not accustomed to being addressed by strange young men, and she was accustomed to being treated with respect and deference—the respect and deference due to her age, eighteen.

'I am not joking,' said he; 'I would not think of doing such a thing. I'm awfully sorry; and I should not have spoken at all—I should not have dared—only I was afraid you might come on Jacko unexpectedly and be alarmed.'

She was mollified somewhat by the concern in the speaker's voice. 'A crocodile?' she said, condescending to admit wonder into her voice.

'Yes,' he said, bringing his chest above the wall by raising himself another rung on the ladder, this causing her to retreat another pace. 'But you really mustn't be afraid. He's only a very small chap. He never goes for people, you know.'

'I don't know,' said she stiffly. She had not been in a good humour at all when taking her solitary walk through these strange grounds, and this affair annoyed her; and this young man—although he seemed really sorry, was very easy

in his address, and should not use slang to her. He annoyed her too.

'Of course not,' said he very humbly. 'I mean he would not think of attacking people. I lost him at our side of the wall, and thought he might have got into Mr Bathurst's grounds through a hole or drain—there is an unbarred drain higher up. I'm very sorry for frightening you—I am indeed; and, of course, I couldn't be so rude 'as to make a joke about such a thing. If you only knew how distressed I am, you'd—you'd believe me,' he ended somewhat incoherently.

Miss Ellen Morton felt that here her dialogue with the unknown young man on the wall ought to end. She was in these grounds of Garwood House, on the Thames, twenty miles above London, for the first time in her life that day. She had no reason to believe that young men in flannels were desperadoes. Still propriety, with the strictest rules of which she was familiar, demanded that this dialogue should end.

But then a crocodile! No rule, of which she had ever even as much as heard, took into account the contingency of a crocodile at large. In historic times, anyway, a crocodile had never before entered into a situation of this kind on the banks of the Thames. It was easy for conventionality to say Go away. But whither? If she moved, she might be walking straight towards the odious reptile, or—worse still—might suddenly hear him running after her behind.

Plainly, it was impossible for her to move. She was not at all timid by nature. But before she came upon this adventure she had not been very happy. She stood still, glancing about her in shivering watchfulness.

'I don't know exactly what I ought to do,' said the young man on the wall in accents of perplexity. 'Mr Bathurst forbids people landing on his grounds from the river or getting over his walls or fences. He is death on trespassers.'

'Is he?' said she, feeling that it was a great pity this exclusiveness did not operate effectually against saurians.

'Oh yes. He's awfully particular about keeping every one out. If I might only slip over and stand beside you, you'd be all right, you know.'

It was hard for Ellen Morton, notwithstanding her eighteen years' experience in life, to deal with this speech. Here was a complete stranger talking in a reproachful tone of her host. This ought to be resented, although she had never met Mr Bathurst yet. Then there was the impudent assumption on the part of this young man that if he were only by her side she should be 'all right!' Still the speaker meant well. And then there was the dreadful thought of the lurking crocodile! She felt as though she must cry. Fancy her, Ellen Morton, crying like an ordinary silly girl! she who always held in scorn and contempt girls who cried for nothing! But, on the other hand, was a crocodile nothing? If she was sure this crocodile was nothing, she should not feel in the least inclined to cry. She should feel very indignant. Why had this young man spoken at all? Why had he not held his tongue, and allowed her to be torn asunder by the crocodile in peace?

'What—what am I to do?' she asked with a little quaver of pathos in her voice.

'Oh, pray, don't!' said he; and before she knew what was happening, he had swung himself over the top of the wall, dropped down, and was standing in front of her, and saying: 'I am sorry I spoke at all. I distressed you without any need. There was no danger from Jacko, except the danger of giving you a fright, if you saw him unexpectedly. And here have I terrified you and nearly made you cry. I'd give all the world,' he said desperately, 'I had held my tongue.'

'I am not going to cry, and I am not terrified,' she said, her dignity giving way before his manifest sincerity, and under the relief afforded by his presence. She turned towards the house, quarter of a mile distant, and began walking towards it.

'You see,' said he, 'I hadn't the least idea there was any one near when I got up the ladder. And, of course, I did not expect to find a lady here. Mrs Bathurst is never about the grounds, and I don't remember any other lady at Garwood.'

'I came only this morning.'

'You are not a member of the family?'

'No. I am not a relative; but I am going to stay a while.'

'Good gracious!' cried he with involuntary astonishment. 'Going to stay at Garwood House for a while!'

'Yes. Why are you astonished?' she asked, widening the distance between them as they walked.

'Oh, nothing,' he said in momentary confusion, and then foundered a moment, and then partly recovered himself. 'I'm sure I beg your pardon; only, you know, you are so unlike Mr Bathurst, I thought you could not be closely related. You must think me very rude to ask. I assure you I did not mean to frighten you, and I didn't mean to be rude; and it is horribly awkward about the crocodile.'

She smiled. His compunction was disarming, engaging. He almost required protection from himself. 'You did not do or say anything so very dreadful. Of course, it is awkward to have the crocodile wandering about, and a pity you lost your—pet.'

'Oh, that's no consequence at all,' said he. 'I wish he were at the bottom of the Red Sea.'

'A crocodile,' said she, with another smile, 'is a fresh-water creature.'

The young man said nothing; he merely made an impatient gesture, as if he were dismissing the reptile to still more unsuitable depths.

'And as to asking me if I were related to Mr Bathurst, there was no harm in that, for I do not know him, have never seen him yet.'

'What!' he cried, pulling up suddenly and staring at her in consternation. 'You don't know him! You haven't seen him! Why, this is worse than anything! This is the worst of all!'

The girl looked at him with displeasure and suspicion. 'What is the matter now?—I can see the house from this. Thank you for your escort so far. Will you not come in?' She moved her hand in formal invitation, but voice and manner conveyed his dismissal.

'To the house?' said he in amazement. 'Oh no, thank you. I am dreadfully afraid you may

not know much, may not know anything about Mr Bathurst!

This was really going too far. 'I must thank you for your kindness and say good-day,' said she frigidly, bowing.

'Oh, pray don't speak in that way. I wouldn't offend you for the world; but I fear you do not know much about Mr Bathurst, and may tell him about—about me and Jacko'— He paused, unable to go on.

'Well?' she asked mercilessly, and conveying grave reproof for the bare notion of making a secret of this meeting.

'Oh! well, indeed, you mustn't tell anything about it to Mr Bathurst, or, I think, to Mrs Bathurst either.—You may well look insulted and astonished; but I assure you I am speaking only to prevent a horrid mess. You don't know that Mr Bathurst has a nickname in the City?—No. I felt you couldn't have heard. How could you? It's horribly unkind and beastly, but—but they call him the Crocodile.'

'What!—And your story of the escaped creature?'

'Oh, believe me, that is quite true. Indeed, indeed, every word I have told you is quite true. It was Mr Bathurst's nickname made me think of buying Jacko, and Jacko really got out of his basket just before I saw you first. Mr Bathurst does not at all like his nickname, and if you told him about me, it would be most unpleasant. I don't care what you may tell him about me, but, for goodness' sake, don't mention the crocodile. If you mention the crocodile, he may think—he may think—I don't know what he may think. But you can see it would be very awkward for you to say anything about a crocodile at your first meeting.' The young man took off his cap. 'I'll watch you safe into the house from this. Jacko must surely be at the other side of the wall. I shall write you to say I have recovered him, so that you may not be afraid to walk about the grounds—that is, if you will tell me to whom a letter for you should be addressed. You see, I can't write to Mr Bathurst or his mother about Jacko; and I couldn't bear to think my carelessness was the means of keeping you in endless dread.'

'My name is Morton,' she said with dignity, and then, with grave politeness and a bow: 'Good-day, and thank you.'

'And my name is George Chaytor.—Good-day.' He bent his bare head, and then raising it, watched the figure of the girl cross the lawn and enter Garwood House. Then, forgetting that he still held his cap in his hand, he plodded back to the boundary wall with eyes bent on the ground and in complete forgetfulness of the whole reptile creation.

A year back Nellie Morton had left school and gone to live with her gentle, sympathetic, childless, maternal aunt Sophie, wife of Colonel Pickering, in Deighton, a quiet garrison town of the south. This June morning her uncle had left her at Garwood House, bidding her final adieu. She was the only child of the widower, Christopher Morton, civil engineer, now residing in Brazil. Mr Bathurst was Morton's business man in London. When Colonel Pickering was ordered abroad, Mr Bathurst's mother wrote to Brazil, offering the girl a home at Garwood House.

Mr Morton replied, thanking Mrs Bathurst for her kindness to his motherless daughter, and saying he should be home for good in the autumn, as he had now made enough for himself and his girl. He had been far from well, but was then much better, almost as well as ever.

Nellie had never seen Mrs Bathurst until this morning, and the interview had proved anything but reassuring to the young girl. Mrs Bathurst was short and very stout, about seventy years of age, with dark, peering, inscrutable eyes, and a heavy portentous manner and delivery. She was not tall or thin or haggard enough for a witch. She looked a dark, unwieldy sorceress.

When bluff, outspoken Colonel Pickering had resigned Nellie into the hands of her new guardian and taken his leave, the old woman said: 'Child, I cannot get about easily. As soon as you have seen your room and taken off your things, come back here. I wish to talk to you.' The tone was not one of request or command; but of a person accustomed to speak and find the words carried into acts as inevitably and automatically as one's limbs obey one's will.

Nellie returned from her room subdued and awed by the gloom of this vast silent house, dark throughout, despite the white sunlight of June morning shining abroad on wood and river and field.

'Take a chair, Ellen,' said Mrs Bathurst as though Miss Morton was the new housemaid, for some unwelcome reason privileged to be seated in the presence of the mistress. 'You will find this place dull. There are the grounds to walk in, and books in the library. I am practically an invalid, although I suffer from no ailment or pain. I never cross the threshold of this house. A young lady cannot walk on country roads alone; you will be obliged to make the most of the grounds, for we keep no horses. We entertain no company. We breakfast at half-past seven, lunch at two, and dine at half-past six. My son is the soul of punctuality. He never varies a minute—never half a minute. Go, explore the grounds between this and luncheon; a bell will ring a quarter of an hour before it is ready.'

Nellie felt far from comfortable as she entered the dreary, hollow, resounding house after her interview with George Chaytor. That great desolate house had oppressed her like a portentous cloud. The meeting with Mrs Bathurst had filled her with tremulous misgivings and vague chilling fears, never even suspected before in her clear, bright, open, happy life. For the first time she now had a secret—she was to say nothing about that incident at the boundary wall. It was a poor, paltry, mean, unhand-some secret, connected with the trivial circumstance of her meeting with that young man, and learning the lowering fact that her father's business man, whom she had never seen and under whose roof she now lived, was known by an uncomplimentary and damaging nickname.

She would have repelled with scorn the idea that there was anything romantic or even interesting in her encounter with young Chaytor. Such a thought could not have occurred to her, and no one was by to suggest it. She had been startled by hearing his voice from the wall. She

had been alarmed at the notion that a hideous reptile might be within reach of her; and she had been disgusted at learning that Mr Bathurst, whom her father and aunt and uncle always spoke of with respect as the custodian and wise investor of her father's fortune, should be treated with such want of feeling and courtesy as to be named after the most loathsome of reptiles.

Mrs Bathurst and Garwood House had filled her with inexpressible fears. She deplored but could not help this. No doubt in time she should overcome these unpleasant feelings. One thing she could do, and that one thing she would do, namely, to yield Mrs Bathurst constant and dutiful respect.

She remained in her room until the bell rang for luncheon. With what alarming shrillness the sound tore through the weird quiet of that lonely house! She wondered, did that clangorous bell peal through the corridors when the old woman was alone? or had it been set going to honour or terrify the guest? It made her shudder to think of rousing all the far-off sleeping echoes of this sombre house for two lonely women.

Luncheon was served in the large dining-room, on the left of the front entrance hall. Here, notwithstanding the brightness and warmth of the day, all was dim and damp. The heavy dark oak furniture, upholstered in deep purple leather, was moist and chilly to the touch. The air of the room was moist, not with the sweet moisture of leafy June, but with faint mouldy exhalations from the banquets of buried generations. The dark wainscoted walls seemed to stand back in sullen distance from the shrunken dining-table. The room looked out upon the front lawn, and the cloth was laid at the end farthest from the curtained windows. Bright as the summer day was, it seemed as though lamps would be indispensable—they would have been regarded with pleasure by any one not morbidly enamoured of gloom.

Mrs Bathurst was standing at the back of the room when Nellie entered. 'Ha!' she said, moving across the floor with difficulty and apparent pain and great slowness, because of her unwieldy bulk. 'You are punctual, child. That is right; we are very punctual in this house.'

The meal was served, and the two women sat down. The parlour maid who attended the table was middle-aged, stolid, stupid-looking. For a long time no word was spoken. Nellie felt glad of this. She did not desire conversation. The desolate genius of this house had begun to work, and was filling with shadowy terrors this girl, who up to that time had lived her life unafraid.

Mrs Bathurst ate little, and Nellie had no appetite at all. Mrs Bathurst made no pretence of entertaining her visitor. She spoke such words as were necessary in the progress of the meal, and now and then bent her inscrutable eyes on her guest. She did not look at the girl as though she wished to see her. Those sorceress eyes never betrayed any thought or emotion. They were the outward organs of a spirit always occupied on itself within. They peered at the girl, but did not stare at her. They did not make Nellie uncomfortable about herself,

as do eyes which stare; but they set her wondering in chilled awe what could this strange old woman be contemplating that made her look so weird.

No pleasant or cheerful thoughts were at the disposal of the girl. Her life up to that day had been one of peaceful happiness at school, and of delicious awakening amid sympathetic surroundings at Deighton, in the society of her soft-mannered, affectionate aunt, and the hearty, outspoken, chivalrous, kind-hearted Colonel. The twelve months spent with her aunt had been a time of complete happiness. No one moment had been marred by unpleasantness of any kind. She loved her gracious and affectionate aunt as she might her mother, if that mother had been spared; and her courteous, honest uncle as though he were the father far away in Brazil, who was no more to her than the beneficent figure of a dream.

This strange gloomy house and this strange mysterious woman had struck into Nellie's young heart the first chill she had ever experienced. She already had the feeling of being in a prison, and she found the air of the house thickening in her throat and suffocating her. She was alone now, in such a solitude as she had never conceived before. She was not to see the Pickerings again; she had stayed with them until the very last moment. If she were to obey her impulse, she would there and then flee from that house; but she was more helpless than a child. She had never yet acted for herself in any affair of consequence. With the disposition to fly, she felt flight was as impossible as though she were fettered with irons a thousand pounds in weight.

The girl was not of a nervous or fanciful nature. She was blithesome and light of heart. She had never known the luxury of a grievance. Her disposition was to look at the cheerful side of things. She had never been ill since the ailments of childhood. She could not believe her present condition of depression and apprehensiveness was the result of spending a few hours in this gloomy house with this silent and self-absorbed old woman. The girl was beginning to think her health must be failing her.

At the end of luncheon the old woman pushed away her plate, and keeping her unfathomable eyes on Nellie, said, with startling unexpectedness: 'What change has come over you since morning? You are not the same. Did you not find the grounds interesting? Have you lighted on no books to your liking in the library?'

The girl could not have been more astonished if one of the grim carved heads in the black oak chimney-piece had addressed her. She had been thinking that if she came into the room and sat down at the table with her hat on, Mrs Bathurst would not notice anything unusual in her appearance; and that if she had fainted or fallen off her chair, Mrs Bathurst would have contented herself with summoning a servant and giving orders that Miss Morton should be carried to her room and attended to. And here was her hostess showing herself, on this very short acquaintance, able to detect a slight alteration in manner or appearance.

'I think the grounds are beautiful,' said Nellie,

when she had recovered from her astonishment sufficiently to be able to speak.

'And you have not been to the library yet?'

'No; I reserved that pleasure for after luncheon.'

'Ah! I hope you may find the library a pleasure. I don't think you took any benefit from the grounds to-day. I hope none of those audacious boating-parties landed and disturbed your walk?'

'No; I did not see any boating-party.' This answer was given with extreme reluctance. It was of course truthful, but it was not the whole truth.

'You are keeping something back from me,' said the old woman; 'but you need not tell me. I am not interested. I do not ask you what. If I wanted to know, you would tell me, but I do not want to know.'

A UNIQUE REPUBLIC.

NOT many persons are aware—or, at least, remember what they may have learned incidentally at some time or other—that between the two kingdoms of France and Spain there lies a Republican community, which has been to some extent associated with the history of both nations, but has been unaffected by the political vicissitudes of either. Among the mountains which separate these two great nations there is a valley which reaches to the French frontier on the one side, and to the borders of Catalonia on the other. This is the Valley of Andorra, in which, for eleven centuries, has dwelt undisturbed probably the most remarkable community in the world. In this Pyrenean valley has rested in practical oblivion, in undisturbed repose, and in a state of independence secured in a unique manner, a Republic, which, through centuries of feudal conquest and disorder, of dynastic change and national revolution, of social upheaval and political reformation, of religious change and intellectual development, has preserved its own manners, its own ideas, its own laws, its own language, its own civil and political organisations, and its own religious opinions and practices, absolutely without alteration or admixture. As it was in the days of Charlemagne, so, one may say, is Andorra to-day. Surely this is a sufficiently startling anachronism at the close of the nineteenth century to merit a little attention and study.

The geographical position of Andorra has been its salvation. Away up among the Pyrenees—not, perhaps, among the very highest and steepest summits, such as the Canigou or the Mont-Perdu, but among the more closely-packed masses where the valleys are narrower and the passes more dangerous—it is situated in a region which is impassable during some parts of the year. It is far away from the regular routes of communication between France and Spain, and outside the lines which invading armies going in either direction must follow. The people, simple in character and rustic in occupation, have never had any foreign sympathies, and have kept themselves in a marvellous degree free from foreign influence. They are poor, and their lands are

mostly pastoral, so there has been nothing to tempt either the ambition or the avarice of their neighbours. By a strange combination of circumstances, indeed, the Republic of Andorra, which is also a feudal State, is able to present to modern society an organism which has neither progressed nor retrograded for a thousand years, and which links us with a long-past ante-feudal society.

To Charlemagne the Andorrans are fond of attributing their independence. The long lines of French and Spanish kings are to them but as idle tales, and it is doubtful if any outside political entity has impressed itself on the Andorran mind save only that of the Great Napoleon. The news of his battles alone seem to have penetrated to Andorra, and have made an impression on the Andorrans, not so much because of the dynastic and national interests involved, as because Napoleon restored the Convention which had been renounced by the French Republic. This Convention was part of the ancient constitution of Andorra; and Napoleon restored it because he regarded Andorra as too curious an organism to be effaced without reason.

Andorra is not only itself a wild and roadless country, but it is surrounded on all sides by wild and roadless country. There is not a single highway leading into it on either side, and the mule-paths through mountain-passes are closed for long portions of the year.

To reach it from France, one starts from the quaint old town of Viedessos, in the department of the Ariege, itself some two thousand feet above the sea. The path is rough, rocky, and crooked to about a height of eight thousand feet to the Port du Rat, from which the descent is equally rough and more precipitous, through a wild and desolate region, to Serrat, the frontier village of Andorra. This is a whole day's journey on horseback, or muleback, and the traveller may think himself fortunate who reaches the Andorran village before nightfall, otherwise he may make acquaintance with either brigands or wolves.

Serrat is picturesque enough as to situation, but is a wretched hamlet, shut in by the mountains, without any inn—there is only one inn in Andorra, and that is in the capital—without even a spare bed or decent food. There are about a dozen houses built of rough stone, without mortar and without windows, and a small rude church.

A journey of four hours will bring the traveller to Andorra town—Andorra-la-Vella—the capital of the country, where is a plain but decent hostelry. This is a place of about seven hundred inhabitants, and here it may be noted that the entire population of the whole State—which is some twenty-eight miles long by twenty miles broad at its longest and broadest—does not exceed six thousand.

Andorra-la-Vella contains the Parliament House of the Republic, a building almost as old, and certainly as quaint, as its institutions. Here the Council-General hold their sittings, and here are kept the State records, in an armoury with six locks, one for each commune, a representative of which carries the key, so that the precious documents can only be reached in the presence of representatives of all the communes.

This Council-General is the governing body, and is composed of twenty-four members—four

representatives from each of the six provinces, or communes, into which the country is divided. These representatives are chosen from among the men of most substance in each commune, and are elected by the heads of families—namely, the householders. Two 'Consuls' are elected every year; in the second year they become 'Councillors;' in the third year, 'Caps-Grossos,' an honorary office without a seat in the Council; and in the fourth year they are eligible for re-election as 'Consuls.' Thus the Parliament never dies, and is never dissolved, and there is no such thing as a general election.

The elected members of the Council-General elect the President and Vice-President not from their own numbers, but from outside. These are termed First and Second Syndics, who are not paid, and who may be turned out of office at any time by a vote of the Council. A Secretary is also elected by vote, and he is the only paid official.

It is sufficiently remarkable to find this system of representative government and democratic institutions existing in an aristocratic and feudal State for over a thousand years; for the system to-day is as it was confirmed by the charter of Louis the Pious; but it is still more remarkable to find in Andorra a perfect system of Home Rule of equal antiquity.

Each of these six communes has also a Parliament of its own—a Communal Council, whose functions are to attend to purely local affairs. They have to manage the communal lands, look after the roads and bridges, preserve order, and give a general superintendence to the industries of their districts. Five of these communes, again, are divided into Quarters, or Cuarts, each with its own Council, elected by the householders, with similar functions in a more limited area. These Provincial and Quarter Councils have no power to levy taxes. Their revenue is derived from the rents of communal lands and woods, out of which they defray expenses and contribute a certain annual amount to the Council-General for the expenses of the State.

The State expenses are practically limited to the tributes paid to Spain and France and the insignificant expenses of the Central Parliament. A government official in each district makes out annually a list of the men who have any property, and of the crops and herds upon the farms; and upon the basis of this return the only tax known in Andorra is assessed. Whatever other public revenue there is, is derived from the rents of the public lands and from forest rights to cut wood.

The Syndics of the Council-General are designated 'Illustrious,' and the First Syndic holds the executive power. There are no written laws to guide him; there is no foreign policy to trouble him; there is no public debt to tax his ingenuity as a financier; there is no annual Budget requiring dexterity in the manipulation of figures and in the anticipation of debits and credits; and there are no Acts of Parliament to be framed or opposed. He has simply to preside over the assembly to see that its deliberations and decisions are conducted in accordance with precedents and time-honoured rules. When any question arises as to custom or precedent, it is decided by the Illustrious Syndic after conference with the Caps-Grossos (or

experienced Councillors), whose duties are to see that no infringement of ancient right or breach of traditional custom shall occur.

While the Andorrans have thus an absolute democratic government, the administration of justice partakes of the old feudal association. The judicial power is exercised by two magistrates called *Veguers*, who are appointed by the Co-Princes—that is to say, France names one and Spain another. These are not only Magistrates, but, as representing the Co-Princes, have the chief command of the Andorran army or militia, although for the purpose of preserving internal law and order only.

Minor cases, and the first processes in civil cases, are dealt with by Bailiffs appointed by the *Veguers*, but all serious cases go before the *Veguers*, or Tribunal de Corts. There is a third officer of justice, a civil judge of appeals, who is appointed for life, and is nominated alternately by the Bishop of Urgel and the French government. He presides at the supreme tribunal to which appeals are carried. In extreme cases there is right of appeal, as a last extremity, to the Co-Prince by whom the sitting judge of appeals was appointed; but this is seldom resorted to.

The salaries of the judges and all the costs of the courts are paid by the litigants; and when the fees are insufficient the balance is made up out of the State funds.

Mention has been made of the army. This is composed of all the able-bodied heads of families, and nominally amounts to six hundred men. Each soldier must provide his own gun; and every householder is bound to keep on hand always a certain amount of ammunition for use when required. This militia is liable to be called to arms at any time; but as a matter of fact, the liability has seldom been enforced to its full extent. They are not paid, and have neither uniform, accoutrements, flags, nor bands.

Such, then, are the institutions of this remarkable State and primitive people, who present to us a type of character and custom absolutely without change for ten centuries. There is surely no other community in the world where one can find the same habits and usages as obtained in the time of the immortal Charlemagne.

Almost perfect as a political organism, Andorra, however, has been stagnant as a society. The people live in the same simple, primitive manner as their forefathers—cultivating the ground and attending to their flocks and herds, but wholly indifferent to education or the advancement of civilisation. They are pious, after the manner of medieval religionists, and it is believed that no Andorran has ever embraced the Protestant faith. They have had neither backslidings nor 'revivals,' and are alike strangers to agnosticism and fanaticism.

The country is remarkably picturesque—a series of fertile valleys surrounded by wild and savage mountains. Through the chief valley flows the river Valira into Spain, and along the banks of this river are situated the principal villages. Six of these only are of any size, even as villages, and they are the chief towns of the several communes. There are a score or so of small hamlets, irregularly built, without any attempt at street-making, and with no appliances for lighting. The houses—with some very few exceptions belonging to the

wealthier citizens—are small and poor, of barn-like and comfortless appearance. They are built of rough stone without mortar, as there is no chalk in the country; and many of them are without glass windows. The ground floor is used for storage and for the housing of the live-stock, and the living-rooms are above.

There are some small lakes, which are well fished by the people; and there is game in the mountains, even game of the larger and more dangerous kinds, such as bears and wild-boars, not to mention wolves and eagles. The Andorrans are all sportsmen after a fashion, and some few of them are smugglers, but the most of them are engaged in agriculture or in timber-felling.

Perhaps the most important industry is the breeding and rearing of mules for the Spanish markets; and next to that, the felling of timber both for domestic use and for sale in Spain, to which it is floated down the Valira. This timber is felled in the mountain forests which belong to the State or commune, and one of the principal sources of revenue is in the licenses, or rents, for tree-cutting.

The arable farms are small in extent, and produce fair crops of wheat, rye, maize, haricot beans, potatoes, and vegetables. Tobacco is grown to a considerable extent, but is not very skilfully manufactured. Most of it is exported to Spain, as is also the surplus fruit, such as walnuts, chestnuts, apples, and pears.

The few imports required by the Andorrans come for the most part from France, one of the rights of the community being to draw from the department of the Ariège all the merchandise it requires without payment of Customs dues.

As a matter of fact, Andorra requires a great many things, but she has so little to offer in exchange that her foreign trade is practically *nil*. She has no Customs tariff herself, and the profits of the Andorran smugglers are made in running the gantlet of the Spanish *douaniers*. She has, however, considerable mineral deposits, which might be developed if she had the means and the energy to make canals and construct machinery; and there are also numerous thermal and mineral springs which may, in some more or less distant future, be transformed into health-resorts. At present they are quite neglected, like most of the natural riches of the country. Perhaps in time the industrial awakening of Spain may extend to this Republic of the mountains, but even Spain is yet far behind the rest of Europe in many things.

Meanwhile, however, Andorra remains at once an example and a warning—admirable in its political institutions, in the law-abiding and industrious character of its people, in its freedom from crime and strife; deplorable in its stagnation and backwardness. It is a land without a literature, and almost without education. There are a few elementary schools of a humble type, and all the people are bound by law to know Catalan, of which the Andorran language is a variant. But they do not read, and there is not a library in the whole Republic. There is not even a newspaper; and only a few of the wealthier inhabitants think of subscribing to French or Spanish newspapers. They are not a very musical people, and there is not a piano in the whole country. They are not given to out-

door recreations, like their neighbours of France and Spain, and public entertainments are unknown. They do not care for flowers or pictures, and would as soon think of flying as of cultivating roses to look at. An Andorran artist has not yet been evolved, nor, apparently, an Andorran mechanician. It is a curious fact that, beyond a few saw-mills and a small weaving-mill, there is no machinery of any kind in the State. Steam is an unapplied force, and electricity a thing as yet undreamed of. Needless to say there is neither railway nor telegraph; there is not even a wheeled vehicle of any kind, for there is not a road on which one could be moved. There is not even an Andorran currency, for the people use the coins of France and Spain, as also the postage stamps, with equal indifference.

A gentleman who has lived much among them tells us that the Andorrans, although not what we call educated, are a religious, well-conducted, peace-loving, and temperate people, sensible and clear-headed up to the point of their own requirements, reserved and taciturn, but wholly trustworthy. They are contented with their lot, and proud of their independence; and yet, perhaps, that independence has been their misfortune. It leaves them in the ninth century, although of the nineteenth.

THE WEDDING RING.

WEDDING rings have been worn in all ages; but no information respecting their origin can be discovered. It is known they were used by the ancient Greeks and Romans; but their use was then at the ceremony of betrothal, and not marriage. Pope Nicholas, writing of the ninth century, says that the Christians first presented the woman with espousal gifts, including a ring, which was placed on her finger; the dowry was then agreed on; and afterwards came the nuptial service. These rings of the Romans were made of various metals, as iron, brass, copper, and gold; and while betrothal and marriage were distinct, the rings were ornamented; but when formal betrothal became obsolete, the marriage ring took a plain shape, as at present.

The ancients wore the betrothal ring, as now, on the next least finger of the left hand. Many reasons are assigned for this, as the erroneous idea that a vein or nerve went direct to the heart, and therefore the outward sign of matrimony should be placed in connection with the seat of life: the left hand is a sign of inferiority or subjection: the left hand is less employed than the right, and the finger next least the best protected. At one time, it was the custom to place the wedding ring on the right hand of the bride. The Anglo-Saxon bridegroom at the betrothal gave a *wed* or pledge, and a ring was placed on the maiden's right hand, where it remained till marriage, and was then transferred to the left.

During the times of George I. and II. the wedding ring, though placed upon the usual finger at the time of marriage, was sometimes worn on the thumb, in which position it is often seen on the portraits of the titled ladies in those days. It is now absolutely necessary to use a ring at the English marriage service. The placing of the ring on the book is a remnant of

the ancient custom of blessing the ring by sprinkling holy water in the form of a cross. This is still done by the Roman Catholic priest. The Puritans attempted the abolition of the ring. The Quakers don't use a ring at the service because of its heathenish origin; but many wear them afterwards. The Swiss Protestants do not use a ring either at the service or afterwards.

Rings have not necessarily been made of gold, in order to be used in the English service. They may be of any metal or size. At Worcester, some years ago, a registrar was threatened with proceedings for not compelling the use of a gold ring. At Colchester, at the beginning of this century, the church key took the place of the ring; and this has been the case elsewhere. A story is told of a couple going to church and requesting the use of the church key. The clerk, not thinking it lawful, fetched a curtain ring, which was used at the ceremony. The Duke of Hamilton was married at Mayfair with a bed-curtain ring. *Notes and Queries* of October 1860 relates the cutting of a leather ring from the gloves of the bridegroom and the use of it at the service. An Indian clergyman stopped a wedding because the ring contained a diamond; and in Ireland all rings except plain gold ones are rigidly forbidden.

One of the earliest forms of rings was the gemel or gimmel ring. It was a twin or double ring, composed of two or more interlaced links, which turned upon a hinge or pivot. These links could be shut up into one solid ring. Each hoop had one convex, and the other flat side; when the two flat sides were in contact, the links formed one ring. Mottoes and devices were often engraved on the inner or flat side. At the time of betrothal, it was customary for the man to put his finger through one hoop, and the woman through the other. They were thus symbolically yoked together. The links were then broken, and the two kept a link until the marriage. Some gimmel rings with three links were made for the purpose of a witness keeping the middle one. There is a gimmel containing nine links still in existence. A gold one given by Edward Seymour to Lady Katharine Grey had five links and a poesy of his own composition.

The *Exeter Garland*, written in 1750, contains:

A ring of pure gold she from her finger took,
And just in the middle the same then she broke;
Quoth she: 'As a token of love, you this take;
And this is a pledge I will keep for your sake.'

Wedding rings, also, were not always worn plain, the common emblem being clasped hands or hearts. Two silver-gilt rings were used for the marriage of Martin Luther and Catherine von Borgia. Luther's ring is still in Saxony, and bears the following: 'D. Martino Luthero, Catherina v. Borgia, 13 Junii 1525.' The other is in Paris, and has a figure of Christ upon the cross, and the Latin inscription as above. On the ring given by Henry VIII. to Anne of Cleves was inscribed, 'God send me well to kepe,' in allusion to the fate of Anne Boleyn. Lady Cathcart, on her fourth marriage in 1713, had the following: 'If I survive, I will have five.' Dr John Thomas, Bishop of Lincoln, 1753, had a similar inscription.

Many superstitions attach to the wedding ring, probably arising from the Roman Catholic custom of its receiving the blessing of the priest before putting it on. In Ireland, the rubbing of the ring on a wart or sore was sure to cure it; also, the belief still remains that by pricking a wart with a gooseberry-bush thorn through a wedding ring it will gradually disappear. In Somersetshire they say that a sty on the eyelid may be removed by the rubbing of the ring. The Romans believed a peculiar virtue lay in the ring finger, and they stirred their medicines with it. Another superstition is that if a wife lose her ring, she will also lose her husband's love; and if she breaks it, the husband will shortly die. Many married women would not remove their rings, for fear of the death of their partners. An old saying is, 'As your wedding ring wears, your cares will wear away.'

THE WORLD AND THE POET.

A BIRD sang out in the meadows,
And took of the ripening grain;
But the people grudged their barley,
And the golden-throat was slain.

A poet brake into music,
Striking the silvern chords;
But the people whispered together,
As they gazed on their glittering boards:

'Where is the substance of music?
What is the value of song?
A breath and a wail and an echo
Out of the heart of the throng;

'A breath that would stir our patience,
The wail of a sometime wrong,
The echo of deeds heroic,
A-throb with the passion of song.

'We were sent for the sowing and reaping,
The labouring early and late;
We are striving, and jostling, and crowding
At Fortune's narrowing gate.

'We dare not linger to listen,
We dare not hearken the song,
Lest we turn our thoughts from the winning,
And are pushed aside by the strong.'

So the people whispered together
Over their piles of gold,
And looked askance at the singer,
Bare-throated, a-hungered, and cold.

He took up the lyre and brake it,
Brake it across his knee,
And despair sat chill on his shoulder
As he laboured out on the lea.

But the people laughed in the market,
Applauding the wiser choice—
And a world was stayed in its progress
For lack of that silent voice.

ANNUITANTS.

A CERTAIN rich man once declared that, with all his wealth, he believed he was neither so happy nor free from anxiety as were some of his old servants on whom he had been pleased to bestow pensions as rewards for their faithfulness. Were he to begin life over again, his aim would be to attain what, in his view, was the *summum bonum* of human life—a restful and independent old age, enjoying the consciousness of a useful and meritorious career. A great deal can be said in favour of such a cheerful philosophy of life. To have but few and simple wants, and to be assured that these wants are ever to be supplied, either as the reward of personal meritorious services, or the result of individual prudence and thrift practised for many years, is a condition of life which kings have been known to envy. And yet it is a condition of life not so difficult to attain as many persons suppose. The ranks of those in enjoyment thereof are being increased in number every year. Not to speak of those who are in receipt of private annuities conferred for various reasons, there are at the present time in the United Kingdom no fewer than 29,832 individuals who have Government annuities amounting in the aggregate to over £540,000, payable half-yearly either through Post-office or Trustee Savings-banks. It is believed that ninety per cent. of these annuitants belong exclusively to the industrial and humbler classes of society, who have been enabled to acquire their assured incomes (averaging nearly twenty pounds a piece) because of their habits of thrift and providence long and patiently practised. Taking the average age of those referred to above at sixty years, and allowing for the slightly increased cost of purchase in the case of female annuitants, the actual amount of money that has been 'sunk' in the hands of the Treasury Commissioners or Postmaster-general in order to yield the foregoing yearly return is something over seven millions sterling!

But of course there are, in addition to those who enjoy Savings-bank or Government annuities,

as they are popularly called, many thousands of persons who take advantage of the annuity system now in operation at most of the life-assurance companies. A large number of these annuitants are likewise to be classified as 'industrial,' or belonging to the humbler ranks of life: many of them, also, have acquired their yearly competencies as the result of a prudential career. Besides these, however, there is another and a wealthier class of annuitants who are more familiar with the precincts of Threadneedle Street than with the headquarters of the Postmaster-general, and who, instead of taking some twopenny 'bus to proceed cityward on quarter-days, can afford the luxury of a cab or brougham, or can even employ the attorney himself to 'ca' for the annuity.' It is more with the former than with the latter class of annuitants that the present paper has to do—with those, rather, who have happily graduated from humble but honourable conditions of labour and service to that state of comparative independence and happiness which the possession of an annuity is supposed to confer.

How, when, and by whom was the system originated of buying and selling annuities, as commonly known at the present day, is not quite certain. The system, however, is comparatively modern. Some authorities incline to the opinion that the credit of the conception of the annuity principle belongs to the famous Italian, Lorenzo Tonti, who 'flourished' at Naples about two and a half centuries ago. The chief feature of the Tontine annuity method was, unfortunately, the speculative element which predominated, an element which to this day permeates—in the lottery system, for example—much of the business methods of the country where, it is stated, it had its origin. According to a late writer on the subject: 'The principle of Lorenzo Tonti's annuity plan was as follows: a certain number of persons clubbed together a specified sum of money—without reference to age or sex—and at the expiration of each year the interest of this fund was divided amongst the subscribers who were living; and so on from year to year, until

the last survivor received the whole of the interest. This novel scheme had all the appearance of a profitable investment, until an inquiry was instituted to ascertain what became of the principal sum subscribed after the death of the last annuitant, the interest fund only having been awarded to the subscribers. This inquiry proved fatal to the plan, for it was found that the principal sum was appropriated by the founders of the scheme to their own uses. A modification of the scheme was then attempted. A number of years was fixed for the continuation of the Tontine, and the entire amount originally subscribed was to be received by the member who last survived. This plan did not meet with general approbation. It possessed great inequalities, as many died without receiving any advantage whatever for their subscriptions; while others, longer lived, received, in many cases, nearly three hundred times the amount advanced. In 1689, the last survivor of a Tontine in France, a widow, prior to her death at the age of ninety-six, enjoyed an income of 73,500 livres (£3062, 10s.) for her original subscription of three hundred livres, or £12, 10s. Surely the type of annuitant that Outram has so graphically delineated!

Other authorities, however, insist that our modern annuity system, including the method of fixing the rate of annuity according to the probability of life, judged of from sound scientific 'experience' calculations, owes its origin to De Witt, the famous Dutchman. At the request of the Government of Holland, De Witt 'investigated all the available data on the subject, and his report and treatise on the terms of Life Annuities was the first known production of the kind.' Happily, there was nothing of the Tontine character in the new system, which gradually became adopted by this and other countries, the absolute fairness of the principle—to both buyer and seller of the annuity—causing the system at once to become popular.

For a long time after annuities became to be regarded in this country as desirable possessions, and the annuitants to be esteemed as persons peculiarly favoured—because, who ever heard of an annuitant becoming bankrupt or 'shuffling off the mortal coil' before fourscore?—the old insurance companies had the monopoly of trafficking in the business of selling annuities. As money went in these days—that is, about the beginning of the present century—the holder of an annuity, say of forty or fifty pounds, with nobody depending upon the return but himself or herself, could keep the wolf a long way from the door. There was, however, always a certain amount of risk from failure of the company, for instance, from which present-day annuitants are happily almost entirely exempt, especially if their money has been 'sunk' in the State funds.

But it was with the introduction of savings-banks into this country, some sixty or seventy years ago, that annuitants as a distinctive and really representative class of people began to increase in number. We cannot honestly say that they 'multiply,' because, as a pretty general rule, annuitants 'neither marry nor are given in marriage,' but occupy, in blissful spinsterhood or bachelordom, a peculiar place in the social economy by themselves! And long may they continue to do so, especially in these times, as—

so the scientists affirm—they help very materially to keep the sometimes over-weighted scales of population in respectable adjustment! As the savings-banks became in the course of time a useful thrift agency, and a right successful one withal, the Government of the day wisely made provision for a means of disposing, to the best advantage, of the deposits accumulated by those depositors who had added nest-egg to nest-egg and had no market for the same. In a few years after their establishment, many such accumulations lay in bank, a large number of the owners being well-to-do servants now getting on in years, plodding tradesmen and mechanics whom no extravagance could tempt to reduce their balances, teachers and governesses, and such-like slender-salaried folks escaped from the matrimonial net, and therefore at liberty to invest their well-earned and carefully-saved money as they were disposed. From these classes chiefly were the annuitants of fifty or sixty years ago recruited. Nor has the lapse of half a century made any considerable change in that particular regard. For the bulk of Government annuitants are drawn from the same classes still, and probably will be so to the end of the chapter. A year or two ago, when Canon Blackley's scheme of 'National Provident Insurance' was before the House of Commons, an interesting table was submitted, showing the following analysis of occupations of a hundred proposers for deferred annuities, from which it appeared that nineteen were domestic servants; twenty-nine were schoolmistresses, teachers, or governesses; eight were married women or spinstresses without any occupation; twelve, clerks or book-keepers; and the remainder—excepting six clergymen, one actor, one doctor, one solicitor, and a few of no stated occupation—belonging entirely to the industrial or artisan classes.

With the establishment of the Post-office system of savings-banks in 1861, and its phenomenally rapid growth throughout the length and breadth of the country, it was only to be expected that a large addition to the number of annuitants would take place. Within a few years—the facilities and advantages to purchasers of annuities being almost the same as in the case of the other system of savings-banks—the ranks of annuitants were recruited from many districts hitherto barren of them. And yet, though their number has increased fifty-fold, an analysis of their character, in so far as occupation can afford a clue thereto, reveals precisely the same fact that the majority of annuitants—at least female annuitants—belong to the three or four classes already referred to.

There is certainly something in the old saying, 'Buy an annuity and worry the sexton!' for the undue age attained by many annuitants is a most remarkable fact, which statistics in superabundance can prove. At the census of 1851, in London alone no fewer than 3072 persons were self-described as 'independent gentlemen,' while 4719 more were returned as annuitants. A few years later—in 1856—only thirty-four—not ten per cent.—of these annuitants had died, a fact which the *Times* referred to in the following terms: 'It has always been usual to regard annuitants as endowed with peculiar tenacity of life, and in the occasional bitterness

of irony, they have been described as the real undying ones of the human race. We confess, however, that we never accepted the impression so completely as in the light of the fact as it has been stated in the Table before us.' It would be interesting to know how many, if any, of these gentlemen are still 'to the fore!' But, after all, the remarkable longevity of annuitants is not so difficult to account for. Everything apparently conspires to their old—very old age. The mere possession of an assured competency, be it big or little, must help potently to prolong life, under ordinary circumstances, in average men and women, inasmuch as it materially conduces to that heart's-ease, that sweet serenity of mind—an elixir such as no empiric can concoct—which can only be extracted from a life spent as prudently as is possible under the existing conditions of society.

But the great age to which many annuitants attain very naturally suggests the question, Does the contract pay the seller? In not a few cases it is undoubtedly a very profitable investment for the annuitant, instances being not unfrequent where the purchasers have actually lived long enough to get their money repaid them twice or even thrice over; but these are of course the exceptions. Thus, a female aged fifty, pays, say, five hundred pounds as the purchase price of an annuity. For this capital sum she obtains an assured annual income of thirty pounds for the rest of her life—that is to say, an unchangeable six per cent. investment for her money, which, however, as capital, is never returnable to her. On attaining her sixty-sixth year, she will have got all her money paid back again, but without interest; and should she survive for fifteen years more—and the presumption that she will do so is a fair one in most cases—she will have got it returned to her twice over. As, however, the fiftieth year is rather under than over the age for annuitants to buy, let us suppose the case of a male aged, say, sixty-five, investing only one hundred pounds in the hands of the National Debt Commissioners—who, by the way, are the agents of the Government in this matter—for that amount he will receive an annuity, payable half-yearly, of £10, 6s. 10d. In less than ten years he will have fully reimbursed himself for the outlay. But even with this splendid return for the invested capital, the question arises on the other hand, Does it pay the purchaser? For a few comparatively safe investments, such as house-property, can be found to yield nearly as high a rate of interest as ten per cent., while leaving the capital always at the disposal of the owner. Both questions may be answered satisfactorily. A very large proportion of Government annuitants are unmarried persons, and consequently in most cases have no dependents whatever, in the ordinary significance of the term, to whom to leave their money; hence their preference to obtain the most they can on the best security while they live. Annuities—and especially Government annuities—being generally considered absolutely safe against all possible contingencies, the annuitants obtain the *maximum of return with the minimum of risk*. This fact goes far to explain the growing popularity, in these days of so many hazardous investments, of the Govern-

ment annuity system; and considering the vast number of financial traps that, from the days of the Great South Sea Bubble affair down even to the present time, have been laid to despoil the over-simple and credulous classes of the people, it is not in the least surprising that it should have become so. There is no worry or anxiety involved. Of course, the money paid to buy the annuity is 'sunk' irretrievably; but the astute and satisfied annuitant knows that the periodical 'yield' from the little mine is payable as regularly and as surely as the seasons come round; and therefore, happy in the assurance of the fact, 'She lives for her annuity!' and has a good right to do so.

THE IVORY GATE.*

By WALTER BESANT.

CHAPTER IV.—A REBELLIOUS CHILD.

ELSIE left her lover at the door. Most accepted suitors accompany their sweethearts into the very bosom of the family—the gynæceum—the parlour, as it used to be called. Not so George Austin. Since the engagement—the deplorable engagement—it was understood that he was not to presume upon entering the house. Romeo might as well have sent in his card to Juliet's mamma. In fact, that lady could not possibly regard the pretensions of Romeo more unfavourably than Mrs Arundel did those of George Austin. This not on account of any family inequality, for his people were no more decidedly of the middle class than her own. That is to say they numbered as many members who were presentable and quite as many who were not. Our great middle class is pretty well alike in this respect. In every household there are things which may be paraded and things *tacenda*: members successful, members unsuccessful, members disgraceful. All the world knows all the things which must be concealed: we all know that all the world knows them; but still we pretend that there are no such things, and so we maintain the family dignity. Nor could the widow object to George on account of his religious opinions, in which he dutifully followed his forefathers; or of his abilities, manners, morals, culture, accomplishments, or outward appearance, in all of which he was everything that could be expected of a young man who had his own fortune to make. A rich young man has no need of manners, morals, abilities, or accomplishments: a thing too often forgotten by satirists when they depict the children of Sir Midas Gorgias and his tribe. The lady's objection was simply and most naturally that the young man had nothing, and would probably never have anything: that he was a managing clerk without money to buy a partnership in a highly congested profession. To aggravate this objection, he stood in the way of two most desirable suitors who were supposed to be ready should Elsie give them any encouragement. They were a rich old man whose morals could no longer be questioned; and a rich young man

* Copyright 1892 in the United States of America by Harper & Brothers.

whose morals would doubtless improve with marriage—if, that is, they wanted improvement, for on this delicate subject ladies find it difficult to get reliable information. And, again, the exalted position of the elder sister should have been an example and a beacon. Which of you, Mesdames, would look on with patience to such a sacrifice—a young and lovely daughter thrown away, with all her charms and all her chances, upon a man with two hundred pounds a year and no chance of anything much better? Think of it—two hundred pounds a year—for a gentlewoman!

There are some families—many families—with whom the worship of wealth is hereditary. The Arundels have been City people, married with other City people—in trade—for two hundred years and more: they are all members of City Companies: there have been Lord Mayors and Sheriffs among them: some of them—for they are now a clan—are rich: some are very rich: one or two are very, very rich: those who fail and go bankrupt quickly drop out of sight. All their traditions are of money-getting: they estimate success and worth and respect by the amount a man leaves behind—it is the good old tradition: they talk of money: they are not vulgar or loud or noisy or disagreeable in any way: but they openly and without disguise worship the great god Plutus and believe that he, and none other, is the God of the Christians. They have as much culture as other people, at least to outward show: they furnish their houses as artistically as other people: they buy pictures and books: but ideas do not touch them: if they read new ideas, they are not affected by them, however skilfully they may be put: they go to Church and hear the parable about Dives and they wonder how Dives could have been so hard-hearted. Then they go home and talk about money.

Elsie's father, a younger son of the richest branch of this family, started with a comfortable little fortune and a junior partnership. He was getting on very well indeed: he had begun to show the stuff of which he was made, a good, stout, tenacious kind of stuff, likely to last and to hold out; he was beginning to increase his fortune: he looked forward to a successful career; and he hoped to leave behind him, after many, many years, perhaps three-quarters of a million. He was only thirty-five years of age, yet he was struck down and had to go. His widow received little more than her husband's original fortune: it was small compared with what she might fairly expect when she married, but it was large enough for her to live with her three children in Pembroke Gardens. What happened to the son, you know. He went away in a royal rage and had never been heard of since. The elder daughter, Hilda, when about two-and-twenty, as you also know, had the good fortune to attract the admiration of a widower of very considerable wealth, the brother of her guardian. He was forty years older than herself, but he was rich—nay, very rich indeed. Jute, I believe, on an extensive scale, was the cause of his great fortune. He was knighted on a certain great occasion when Warden of his Company, so that he offered his bride a title and precedence, as well as a great income, a mansion in Palace Gardens,

a handsome settlement, carriages and horses, and everything else that the feminine heart can desire.

The widow, soon after her husband died, found the time extremely dull without the daily excitement of the City talk to which she had been accustomed. There was no one with whom she could discuss the money market. Now, all her life, she had been accustomed to talk of shares and stocks and investments and fluctuations and operations and buying in and selling out. She began, therefore, to watch the market on her own account. Then she began to operate: then she gave her whole time and all her thoughts to the business of studying, watching, reading, and forecasting. Of course, then, she lost her money and fell into difficulties? Nothing of the kind: she made money. There is always plenty of virtuous indignation ready for those foolish persons who dabble in stocks. They are gamblers: they always lose in the long run: we all know that: the copy-books tell us so. If two persons play heads and tails for sovereigns, do they both lose in the long run? If so, who wins? Where does the money go? Even a gambler need not always lose in the long run, as all gamblers know. *La Veuve Arundel* was not in any sense a gambler. Nor was she a dabbler. She was a serious and calculating operator. She took up one branch of the great money market and confined her attentions to that branch, which she studied with so much care and assiduity that she became a professional; that is to say, she threw into the study all her energies, all her thoughts, and all her intellect. When a young man does this on the Stock Exchange he may expect to win. Mrs Arundel was not an ordinary young man; she was a sharp and clever woman: by hard work she had learned all that can be learned, and had acquired some of that prescience which comes of knowledge—the prophet of the future is, after all, he who knows and can discuss the forces and the facts of the present: the Sibyl at the present day would be a Journalist. She was clear-headed, quick to see and ready to act: she was of a quick temper as well as a quick perception: and she was resolute. Such qualities in most women make them absolute sovereigns in the household. Mrs Arundel was not an absolute sovereign—partly because she thought little of her household, and partly because her children were distinguished by much the same qualities, and their subjection would have proved difficult if not impossible.

This was the last house in London where one might have expected to find a girl who was ready to despise wealth and to find her happiness in a condition of poverty. Elsie was completely out of harmony with all her own people. There is a good deal of opinion going about in favour of the simple life: many girls have become socialists in so far as they think the amassing of wealth neither desirable nor worthy of respect: many would rather marry a man of limited means who has a profession than a rich man who has a business: many girls hold that Art is a much finer thing than wealth. Elsie learned these pernicious sentiments at school: they attracted her at first because they were so fresh: she found all the best literature full of these sentiments: she developed in due course a certain natural

ability for Art: she attended an Art school: she set up an easel: she painted in pastel: she called her room a studio. She gave her friends the greatest uneasiness by her opinions: she ended, as you have seen, by becoming engaged to a young man with nothing. How could such a girl be born of such parents?

When she got home on Saturday evening, she found her mother playing a game of double *vingt un* with a certain cousin, one Sydney Arundel. The game is very good for the rapid interchange of coins: you should make it a time game, to end in half an hour—one hour—two hours, and at the end you will find that you have had a very pretty little gamble. Mrs Arundel liked nothing better than a game of cards—provided the stakes were high enough to give it excitement. To play cards for love is indeed insipid: it is like a dinner of cold boiled mutton or like sandwiches of veal. The lady would play anything, piquet, *écarté*, double dummy—and her daughter Elsie hated the sight of cards. As for the cousin, he was on the Stock Exchange: he came often to dinner and to talk business after dinner: he was a kind of musical box or barrel organ in conversation, because he could only play one tune. His business as well as his pleasure was in the money market.

'So you have come home, Elsie?' said Mrs Arundel coldly.

'Yes, I have come home.' Elsie seated herself at the window and waited.

'Now, Sydney'—her mother took up the cards. 'My deal—will you take any more?'

She was a good-looking woman still, though past fifty: her abundant hair had gone pleasantly gray, her features were fine, her brown eyes were quick and bright: her lips were firm, and her chin straight. She was tall and of good figure: she was clad in black silk, with a large gold chain about her neck and good lace upon her shoulders. She wore many rings and a bracelet. She liked, in fact, the appearance of wealth as well as the possession of it: she therefore always appeared in costly raiment: her house was furnished with a costly solidity: everything, even the bindings of her books, was good to look at: her one manservant looked like the responsible butler of a millionaire, and her one-horse carriage looked as if it belonged to a dozen.

The game went on. Presently, the clock struck ten. 'Time,' said the lady. 'We must stop. Now then. Let us see—I make it seventy-three shillings.—Thank you. Three pounds thirteen—an evening not altogether wasted.—And now, Sydney, light your cigar. You know I like it. You shall have your whisky and soda—and we will talk business. There are half-a-dozen things that I want to consult you about. Heavens! why cannot I be admitted to the Exchange? A few women among you—clever women, like myself, Sydney—would wake you up.'

They talked business for an hour, the lady making notes in a little book, asking questions and making suggestions. At last the cousin got up—it was eleven o'clock—and went away. Then her mother turned to Elsie.

'It is a great pity,' she said, 'that you take no interest in these things.'

'I dislike them very much, as you know,' said Elsie.

'Yes—you dislike them because they are of real importance. Well—never mind.—You have been out with the young man, I suppose?'

'Yes—we have been on the river together.'

'I supposed it was something of the kind. So the housemaid keeps company with the potboy without consulting her own people.'

'It is nothing unusual for me to spend an evening with George. Why not? You will not suffer me to bring him here.'

'No,' said her mother with firmness. 'That young man shall never, under any circumstances, enter this house with my knowledge! For the rest,' she added, 'do as you please.'

This was the kind of amiable conversation that had been going on day after day since Elsie's engagement—protestations of ceasing to interfere, and continual interference.

There are many ways of considering the subject of injudicious and unequal marriages. You may ridicule: you may cajole: you may argue: you may scold: you may coax: you may represent the naked truth as it is, or you may clothe its limbs with lies—the lies are of woven stuff, strong, and home-made. When you have an obdurate, obstinate, contumacious, headstrong, wilful, self-contained maiden to deal with, you will waste your breath whatever you do. The mother treated Elsie with scorn, and scorn alone. It was her only weapon. Her elder sister tried other weapons: she laughed at the makeshifts of poverty: she cajoled with soft flattery and golden promises: she argued with logic pitiless: she scolded like a fishwife: she coaxed with tears and kisses: she painted the loveliness of men who are rich, and the power of women who are beautiful. And all in vain. Nothing moved this obdurate, obstinate, contumacious, headstrong, wilful Elsie. She would stick to her promise: she would wed her lover even if she had to entertain Poverty as well all her life.

'Are you so infatuated,' the mother went on, 'that you cannot see that he cares nothing for your happiness? He thinks about nobody but himself. If he thought of you, he would see that he was too poor to make you happy, and he would break it off. As it is, all he wants is to marry you.'

'That is indeed all. He has never disguised the fact.'

'He offers you the half of a bare crust.'

'By halving the crust we shall double it.'

'Oh! I have no patience. But there is an end. You know my opinion, and you disregard it. I cannot lock you up, or beat you, for your foolishness. I almost wish I could. I will neither reason with you any more nor try to dissuade you. Go your own way.'

'If you would only understand. We are going to live very simply. We shall put all unhappiness outside the luxuries of life. And we shall get on if we never get rich. I wish I could make you understand our point of view. It makes me very unhappy that you will take such a distorted view.'

'I am glad that you can still feel unhappiness at such a cause as my displeasure.'

'Well, mother, to-night we have come to a final decision.'

'Am I to learn it?'

'Yes; I wish to tell you at once. We have

been engaged for two years. The engagement has brought me nothing but wretchedness at home. But I should be still more wretched—I should be wretched all my life—if I were to break it off. I shall be of age in a day or two and free to act on my own judgment.'

'You are acting on your own judgment already.'

'I have promised George that I will marry him when he pleases—that is, about the middle of August, when he gets his holiday.'

'Oh! The misery of poverty will begin so soon? I am sorry to hear it. As I said above, I have nothing to say against it—no persuasion or dissuasion—you will do as you please.'

'George has his profession, and he has a good name already. He will get on. Meantime, a little plain living will hurt neither of us. Can't you think that we may begin in a humble way and yet get on? Money—money—money.—Oh! Must we think of nothing else?'

'What is there to think of but money? Look round you, silly child. What gives me this house—this furniture—everything? Money. What feeds you and clothes you? Money. What gives position, consideration, power, dignity? Money. Rank without money is contemptible. Life without money is miserable, wretched, intolerable. Who would care to live when the smallest luxury—the least comfort—has to be denied for want of money. Even the Art of which you talk so much only becomes respectable when it commands money. You cannot keep off disease without money: you cannot educate your children without money: it will be your worst punishment in the future that your children will sink and become servants. Child!' she cried passionately, 'we must be masters or servants—nay—lords or slaves. You leave the rank of lord and marry the rank of slave. It is money that makes the difference—money—money—money—that you pretend to despise. It is money that has done everything for you. Your grandfather made it—your father made it—I am making it. Go on in your madness and your folly. In the end, when it is too late, you will long for money, pray for money, be ready to do anything for money—for your husband and your children.'

'We shall have, I hope, enough. We shall work for enough—no more.'

'Well, child,' her mother returned quietly, 'I said that I would say nothing. I have been carried away. Let there be no more said. Do as you please. You know my mind—your sister's mind—your cousins'—'

'I do not wish to be guided by my cousins.'

'Very well. You will stay here until your wedding day. When you marry, you will leave this house—and me and your sister and all your people. Do not expect any help from me. Do not look forward to any inheritance from me. My money is all my own to deal with as I please. If you wish to be poor you shall be poor. Hilda tells me that you are to see your guardian on Monday. Perhaps he may bring you to your senses. As for me—I shall say no more.'

With these final words the lady left the room and went to bed. How many times had she declared that she would say no more?

The next day being Sunday, the bells began

to ring in the morning, and the two ladies sallied forth to attend divine service as usual. They walked side by side, in silence. That sweet and gracious nymph, the Lady Charity, was not with them in their pew. The elder lady, externally cold, was full of resentment and bitterness: the younger was more than usually troubled by the outbreak of the evening. Yet she was no nearer surrender. The sermon, by a curious coincidence, turned upon the perishable nature of earthly treasures, and the vanity of the objects desired by that unreasoning person whom they used to call the Worldling. The name has perished, but the creature still exists, and is found in countless herds in every great town. The parsons are always trying to shoot him down; but they never succeed. There was just a fiery passage or two directed against the species. Elsie hoped that the words would go home. Not at all. They fell upon her mother's heart like seed upon the rock. She heard them, but heard them not. The Worldling, you see, never understands that he is a Worldling. Nor does Dives believe himself to be anything more than Lazarus, such is his modesty.

The service over, they went home in silence. They took their early dinner in silence, waited on by the solemn man-servant. After dinner, Elsie sought the solitude of her studio. And here—nobody looking on—she obeyed the first law of her sex, and had a good cry. Even the most resolute of maidens cannot carry through a great scheme against great opposition without the consolation of a cry.

On the table lay a note from Mr Dering:

MY DEAR WARD—I am reminded that you come of age on Monday. I am also reminded by Hilda that you propose to take a very important step against the wish of your mother. Will you come and see me at ten o'clock to talk this over?—Your affectionate Guardian.'

Not much hope to be got out of that letter. A dry note from a dry man. Very little doubt as to the line which he would take. Yet, not an unkind letter. She put it back in her desk and sighed. Another long discussion. No: she would not discuss—she would listen, and then state her intention. She would listen again, and once more state her intention.

On the easel stood an almost finished portrait in pastel, executed from a photograph. It was the portrait of her guardian. She had caught—it was not difficult with a face so marked—the set expression, the closed lips, the keen eyes, and the habitual look of caution and watchfulness which become the characteristics of a solicitor in good practice. So far it was a good likeness. But it was an austere face. Elsie, with a few touches of her thumb and the chalk which formed her material, softened the lines of the mouth, communicated to the eyes a more genial light, and to the face an expression of benevolence which certainly had never before been seen upon it.

'There!' she said. 'If you would only look like that to-morrow, instead of like your photograph, I should have no fear at all of what you would say. I would flatter you, and coax you, and cajole you, till you had doubled George's

salary and promised to get round my mother. You dear old man! You kind old man! You sweet old man! I could kiss you for your kindness.'

DRURY LANE.

WHEN, in the year 1663, Charles II. granted patents for the existence of two theatres in London, one of these was assigned to Davenant, who was at the head of the Duke of York's Company of players, and the other to the King's Company, under Thomas Killigrew. The latter body of actors enjoyed a peculiar position. Honoured by the title of 'His Majesty's Servants,' they formally swore before the Lord Chamberlain faithfully to serve the King; ten of their number were enrolled among the Royal Household as 'Gentlemen of the Great Chamber,' and wore liveries of scarlet and silver.

On the receipt of his patent, Killigrew decided to build himself a theatre on a spot in Drury Lane, close to where the famous Cockpit had stood, and very nearly on the site of the present house. Drury Lane was at that time in high favour with the aristocracy—the Marquis of Argyll and the Earl of Anglesey, amongst others, having their residences in the neighbourhood. And so, in the autumn of 1663, the first Drury Lane Theatre opened with a performance of Beaumont and Fletcher's *Humorous Lieutenant*.

Killigrew's company included many whose names became famous—Hart, Kynaston (renowned as a youth for his impersonations of female characters in the days before women were seen on the English stage, and subsequently an excellent actor of men's parts), Mohun, 'Scum' Goodman, Reeves, and Shirley. Amongst the ladies the two beautiful Misses Marshall were the most prominent, until, two years later, the fascinating Nell Gwynne put all her companions into the shade. 'Pretty, witty Nell,' after being carefully coached by the actor Hart, made her first appearance in Dryden's *Indian Emperor*, and speedily captivated the hearts of all who saw her.

Everything conspired to give brilliant success to the first years of the new house. The public, after their protracted theatrical starvation during the civil war and the years that followed it, had the keenest appetite for dramatic fare; at the same time the performances were exceedingly good, and were rendered the more acceptable by the fact that the female parts were undertaken by women, instead of by boys or shaven men as had been the case before the Restoration. This innovation was originally introduced by a company of French players, and for a while met with the most violent opposition. Gradually, however, the sense of dramatic propriety asserted itself; and in the King's patent it was stated that 'whereas the women's parts in plays have hitherto been acted by men, at which some have taken offence, we do give leave that for the time to come all women's parts be acted by women.' The crowded state of both theatres at this time may be inferred from Pepys's entry in his Diary on May 28, 1664: 'By water to the Royal Theatre [Drury Lane]; but that was so full they

told us we could have no room. And so to the Duke's House; and there saw *Hamlet* done, giving us fresh reason never to think enough of Betterton.' Unfortunately, the life of the first Drury Lane Theatre was but brief, for in January 1672 it was burnt to the ground.

In little more than two years a second house, designed by Sir Christopher Wren, sprang from the ashes of its predecessor, and opened its doors on March 26, 1674. The prices of admission were: Boxes, from half-a-crown to four shillings; pit, one-and-sixpence to half-a-crown; first gallery, a shilling to one-and-sixpence; upper gallery, sixpence to a shilling. The auditorium must have been seriously encroached upon by the manner in which the stage was constructed. It projected, as we learn from Cibber's *Apology*, as far as the front rows of the pit, in a semi-oval form, so that the whole action of the play was carried on beyond the proscenium. Though this, no doubt, enabled subtle shades of expression and play of feature to be closely observed by all in the house, the inconvenience of the fashion was obviously felt, as the size of the stage was before long reduced and stage boxes constructed at the sides.

The competition between the King's company and Davenant's was great. Both contained excellent performers, and by both were presented plays of the first rank. For a while, in spite of the strong counter-attraction of Betterton at the Haymarket, the superiority of the acting at Drury Lane maintained the lead. But eventually the fortunes of both companies began to droop: as neither seemed strong enough to stand alone, the Lord Chamberlain ordered them to unite, and in 1682 the joint companies commenced playing at Drury Lane.

This did not prove to be altogether a wise move. Hart, Mohun, and Nell Gwynne retired from the company at the amalgamation, thus weakening its powers of attraction, and, moreover, there appears to have been at this period a sensible falling-off in the interest exhibited by the public. This was probably caused partly by reaction from the excessive enthusiasm of a few years before, and partly by the visit of certain French and Italian companies, which for a time became the vogue. At anyrate, some five years later, we find the patent rights of the theatre sold for a miserable sum to Christopher Rich, a lawyer and thorough scamp. His treatment of the long-suffering actors ended by causing a revolt among them; and at last, on their petition, King William granted to such as wished to secede from the company a license to open the old theatre in Lincoln's Inn Fields. All the leading actors, including Betterton, Mrs Barry, and Mrs Bracegirdle, eagerly seized the opportunity, and with Congreve as their dramatic author tried their fortunes independently, and with no small success. Meanwhile, Rich was left at Drury Lane with the dregs of the company, who, as the manager still persevered in his sharp practices, revolted again; and the upshot of the matter was that in 1709 the Lord Chamberlain closed the theatre.

Two years later commenced the famous triple management of Colley Cibber, Doggett, and Wilks, whose discretion and honest dealing secured for the house twenty years of almost

untroubled prosperity. Wilks as a light comedian, and Doggett as an eccentric-character actor, were unapproachable; and with such female support as Ann Oldfield and Mrs Porter it is easy to understand how it was that crowded audiences once more became the order of the day. From the business point of view the management, if we may believe Colley Cibber, was unimpeachable—and Cibber, though disposed to arrogate too much to himself, was, as Dr Johnson said, 'no blockhead.' 'In the twenty years we were our own directors,' says Cibber, 'we never had a creditor that had occasion to come twice for his bill; every Monday morning discharged us of all demands before we took a shilling for our own use; and from this time we neither asked any actor, nor were desired by them, to sign any agreement whatsoever. The rates of their respective salaries were only entered in our daily pay roll, which plain record every one looked upon as good as city security.' After the dissolution of this management by the death of two of its members and the retirement of the third, a period of disaster ensued; and it was not until the appearance of Macklin in 1741 that the fortunes of the theatre showed signs of mending. The freshness and unconventionality of Macklin's acting took the town by storm, and for a time the Drury Lane 'treasury' was well filled. But it was not long before differences arose between Fleetwood (the then manager) and his actors. The quarrels became serious and led to riots at the theatre, and eventually in 1746 Fleetwood retired from the management in favour of James Lacy—who had been stage manager at Covent Garden—and David Garrick. Garrick was nominally stage manager at first, but the real guidance of affairs soon passed into his hands, and now there commenced the most notable period in the history of the theatre.

The thirty years of Garrick's management were as remarkable for the order preserved in front of the curtain as for the quality of the performances upon which it rose. To begin with, a great abuse was removed by the exclusion of spectators from the stage. On one of his earliest bills Garrick printed the following announcement: 'As the admittance of persons behind the scenes has occasioned a general complaint on account of the frequent interruptions in the performances, it is hoped that gentlemen won't be offended that no money will be taken there for the future.' Garrick was surrounded by a very strong company, including, amongst others, Macklin, Spranger Barry, Mrs Pritchard, Kitty Clive, and the inimitable Peg Woffington. Amongst the many histrionic triumphs that Drury Lane saw during this period, there was one failure which has a peculiar interest in the light of subsequent events. This was the first appearance of Mrs Siddons, in December 1775, as Portia. The genius of the great *tragédienne* was not yet sufficiently matured. Nervousness completely incapacitated her, and neither in this nor in the other parts she attempted at the time did she win any praise from the critics. But when, after seven years' hard work in the provinces, she again challenged the verdict of the town, there was no longer any question as to her supremacy in her art.

On Garrick's retirement in 1776, Sheridan

succeeded to the management in partnership with Dr Ford and Thomas Linley, the musician, and under these auspices the second Drury Lane Theatre passed the few remaining years of its life. These fifteen years are full of interest, for it was during this time that the *School for Scandal* was produced, that Mrs Siddons made her triumphant second *debut*, that Kemble made his first bow to a London audience, and that fascinating Dora Jordan stole away the hearts of susceptible playgoers. In 1791 the old and now decaying house was pulled down, and three years later the third Drury Lane Theatre was opened with much pomp and circumstance.

Its career was brief and checkered. In spite of elaborate precautions against fire, it was burnt to the ground fifteen years afterwards, and while it stood, its fortunes were constantly imperilled by the reckless extravagance and barefaced dishonesty of the manager, Sheridan. It was quite the exception for a bill or a salary to be paid, and many were the ludicrous shifts to which Sheridan resorted to escape from his infuriated creditors. Mr Edward Stirling relates that Holland, the architect of the theatre, could never get Sheridan to pay him for his work, and finally, tired of being put off with constant excuses, resolved to call upon the manager during rehearsal time. 'Before he could utter a word, Sheridan rushed to him, and seizing his hand, exclaimed: "Dear Holland—the very man I wished to see! You want a cheque, of course? Beautiful building! Everything one could desire, save a trifle, but important to me. My shilling-gallery customers can't hear a word that's spoken on the stage."

"Impossible!" said Holland.

"Is it? You shall judge. Remain at the foot-lights!"

'Scampering up-stairs to the gallery, he began to gesticulate, widely extending his mouth, but not uttering a word, to the great confusion of the poor architect. Descending to the stage, he asked: "Well, my boy, did you hear me?"

"Not a word."

"Are you convinced?—No? Well, then, go up yourself and listen while I speak from here."

'Holland climbed to the upper gallery, while Sheridan rushed out at the stage door, leaving the unfortunate architect to make the best of circumstances.'

When, on the night of February 24, 1809, the fire broke out at Drury Lane, Sheridan was in the House of Commons. As a mark of sympathy it was proposed that the House should adjourn, but that Sheridan respectfully declined. Rushing to the burning theatre, he was forcing his way through the crowd, when one of the soldiers who were keeping order, not recognising him, endeavoured to keep him back. 'Surely, my friend,' exclaimed Sheridan, 'a man may warm himself by his own fire.'

After considerable delay, a sufficient sum was subscribed towards the work of rebuilding; and on October 10, 1812, the present theatre was opened. A contemporary newspaper, in an account of the opening ceremony, says that the crowds that assembled at the doors as early as two o'clock were exposed to a pitiless storm of rain and wind, and that many, in consequence, were the complaints of the lack of shelter—the

portico not having been added till some years later. 'After the interior of the house had been sufficiently admired, the curtain drew up, and gave the spectators a charming display of scenery, which they rapturously applauded. There were seven exhibited, of which a perspective Landscape with Water, a Piazza, a Seaport, a Prison Scene, and the Market Cross of Glastonbury, were the most striking.' 'God save the Queen' and 'Rule Britannia' were sung by the 'entire strength' of a company which included Mrs Jordan, Mrs Glover, Miss Smith, Bannister, Elliston, Pyne, &c. But strong as it was, the company failed to compete successfully with the superior attractions of the Kembles, Liston, and Sally Booth at Covent Garden; indeed, its luck seemed to have totally deserted the house until the eventful night of January 26, 1814, when Edmund Kean made his phenomenally successful debut as Shylock, and for six years afterwards drew all London to Drury Lane. Unfortunately, the management, which was in the hands of a Committee, was incompetent, and this turn of fortune was but ill utilised; in 1819, eventually, the Committee handed over their office to Elliston, who was by this time an established favourite with the public.

For the next fifty years, though it was the scene of many artistic successes, Drury Lane proved too heavy a burden for each manager in his turn. Besides certain small fry who held the house for a time (at one period there were three lessees in as many weeks, and all three bolted without paying either salaries or rent!) Elliston became bankrupt in seven years; Bunn twice tried to make the theatre pay by turning it into a species of miscellaneous show, but each time retired heavily in debt; Macready was bankrupt at the end of two years; and though Chatterton struggled through eleven seasons, he was soon forced to give up the fight.

The present Drury Lane Theatre has witnessed an extraordinary variety of scenes, some interesting and honourable, some most derogatory. Under Bunn's management drama and opera alternated with tight-rope dancing, lion-taming performances, and promenade concerts. For some time a French circus occupied the house which, in Macready's time, had seen the famous revival of *As you like it*, in which Mrs Nisbett was the Rosalind; Mrs Keeley, Audrey; Mrs Stirling, Celia; Macready, Jaques; Anderson, Orlando; Keeley, Touchstone; Phelps, Adam; and Ryder, the Banished Duke. Macready's reign was also signalled by the appearance of Helen Faucit as Constance in *King John*, and by the production of Marston's *Patrician's Daughter* and Browning's *Blot on the 'Scutcheon*. In a revival of Dryden's *King Arthur*, with Purcell's music, a great success was made in the tenor solos by a young and unknown singer of the name of Sims Reeves.

In 1866, Chatterton, the last unsuccessful manager of Drury Lane, started with a fine company, in which were Phelps, Barry Sullivan, Helen Faucit, and Miss Neilson. He commenced with high artistic aims, and gave his energies to the fitting representation of classical plays. But inasmuch as, according to his own epigram, he found that 'Shakespeare spelt Ruin, and Byron Bankruptcy,' he produced in 1863 a realistic melodrama of modern life, the forerunner of

much similar fare since offered to the public at the national theatre. In this piece, *The Great City*, Mrs Kendal—then Madge Robertson—made her first appearance upon the metropolitan stage.

URGENT PRIVATE AFFAIRS.

CHAPTER II.—THE FORTUNE AND THE WIFE.

AT the first sentence, Nellie had to exert all her strength to prevent herself springing up from her chair. She felt the words like the sting of a lash. She—she, Nellie Morton had been as good as accused of lying! *She!* She who had never in all her life been accused of the most trivial moral offence, was as good as charged with subterfuge. *She*, the integrity of whose honour had never been questioned, was charged, or as good as charged, with the unforgivable baseness of want of candour!

But as the old woman uttered the other sentences, the flush of anger left the girl's heart; and when Mrs Bathurst, in slow and impersonal accents, finished, Nellie felt as though she should sink through the floor with mingled shame and fear. She could not disclose the encounter with young Chaytor, for she could not explain the circumstance of that meeting without mentioning the unflattering nickname; and although it seemed unlikely Mr Bathurst's mother, so old a woman and a recluse, should have heard of the nickname, that young man evidently thought she might.

Fortunately for Nellie, the old woman's words did not require a reply. The girl could not deny she was concealing something, and could not tell what it was.

Mrs Bathurst seemed to know by occult means that her guest would make no response.

As Nellie was about to rise, the old woman leaned her elbow on the table and her chin on her palm, and with eyes staring into vacancy said, as though soliloquising: 'My son is much immersed in business, and is no lady's man. *He* is not likely to help you much towards enjoying your visit to Garwood. I predicted to him that you would find this place distasteful; but he said no. You were, he said, his friend's child, and you would be contented with this house as a home until your father's return from Brazil.'

Were ever such words spoken by hostess to helpless guest? Nellie thought of rising and saying she would put an end to Mrs Bathurst's uneasiness on her account by leaving at once. But there was something so impressive and sibylline in the manner of the old woman, that the girl could not do aught but sit and listen spellbound.

Mrs Bathurst went on after a pause: 'My son is forty-two years of age. He is not a marrying man. He will never marry. He has no small-talk. He is a great business man. He makes thousands where other men starve. His whole soul is in his business. He is not popular in the City. His appearance is not prepossessing. He is called the Crocodile.'

The girl fell back on her chair.

Mrs Bathurst went on: 'He suffers from a strange nervous affection. For a long time, for days and weeks, he can preserve an unbroken

calm while going through intense mental excitement. Then suddenly, and always close to midnight, he is seized with paroxysms of uncontrollable laughter. Never do these paroxysms come on him until he has gone to his room or is about to go there; never until he has dismissed all thought of business and taken off his mind the great strain under which his affairs in the City now and then place him. All who live under this roof must know of these paroxysms. The secret of them must be kept. Hence we have no visitors. Hence no one is allowed to camp on our grounds. Hence the solitude of this house. My son has been going to the City every day for twenty-five years. He has never been ill. He has never taken a holiday. He is never a minute before or after time in anything. He has never set off earlier or later than eight o'clock. He is always in to the minute at six. He has never varied once for years. At five minutes past six this evening you will be introduced to him.

A loud, long knock sounded at the front door and rolled in clattering echoes through the house.

With a start the old woman stopped and stared around in horror, as though the ground were splitting and gaping at her feet. She grasped the table in front of her as if drawn towards some awful abyss.

Nellie stood up, trembling, and looked round.

The old woman raised one hand, as if in appeal for mercy to some unseen power, and pressed a finger of the other hand on her lip for silence.

Nellie heard the front door slammed with a bang that made the doors and windows rattle. Then the whole house shook above their heads with a terrific shout of laughter twice repeated. The dining-room door flew open. The figure of a short, stout man burst into the room, flung the door to behind him, fell with his broad back against the door, opened an enormous mouth in his parchment-coloured face, and uttered a shout of laughter which made the glasses dance and seemed to threaten the very walls of the room.

Nellie's heart stood still, and with a swimming feeling of faintness, she fell back on her chair.

Although, when Nellie Morton fell on her chair, power of motion deserted her, she did not lose all consciousness. She leaned partly against the table, partly against the back of her chair. She was facing the door, against which the ungainly, monstrous figure of the man was propped. She did not hear or see distinctly. All was dull and blurred as in an indistinct dream.

'William! William! what has done this?' cried Mrs Bathurst in a tone of surprise, reproach, alarm. She rose laboriously and half crossed the floor towards her son. Keeping her strange weird eyes fixed on him, she said impressively: 'We are not alone, William; Miss Morton has come.' She supported herself by putting her hand on the table, turned to the girl, saying: 'Miss Morton, this is my son William: Mr William Bathurst, who invests your father's money to such excellent advantage.' The girl's appearance attracted her attention. She cried in a tone of relief: 'William, she has fainted!' Mrs Bathurst would not summon help. She did not wish a servant to witness this scene. She could not render any aid herself, and until

the paroxysm was over, her son would be worse than useless.

Her son took his back from the door, thrust his hands deep into his trousers-pocket, and bending his whole body double, laughed at the top of his terrific voice, until the glasses on the table rang again and trembled, and the windows shook, and the ceiling vibrated, and a long flake of white fell on the table, as though the plaster were coming down.

'What is the matter?' said the old woman more sternly. 'Can you not speak, William? What has done this?'

He ceased to laugh and dance, and flung himself into a large easy-chair standing in the darkest part of the room, facing the light. He threw his head back, and gasped for air. His mouth was of enormous size, and seemed to open at the sides back to the angle of his distended jaws. The skin of his face hung thin and leathery and folded and creased in innumerable small wrinkles.

The perplexity in the face and manner of the mother showed she was wholly unprepared for an attack under existing circumstances. He had never before come home from the City in the middle of the day. He had never before suffered a seizure until close to midnight. Almost invariably the attack came on after retiring to his bedroom. It would have been impossible to drown his shouts or conceal the noise of his tramping. But the servants of that household were all in bed at ten of nights; and when a new servant was in the place and a paroxysm occurred, Mrs Bathurst said next day that the master had had one of the seizures to which he had been liable all his life, that they were noisy, but not dangerous to himself or any one else, and that it was desired no one should speak of the matter either in the house or out of it.

But here now, on the day this girl arrives, was her son back hours before his time, taken with one of his worst fits in daylight and in the presence of the stranger too!

'Can you not speak? Can you say nothing to explain this extraordinary occurrence? Speak! You need not mind her; she cannot hear us.'

The girl would have given all the world to escape from this scene, to show by gesture or tell by word that she was aware of what was going on around her. But she was powerless as the chair upon which she sat, as the painted figures in the pictures on the walls.

With a convulsive motion the man sat up, seized his knees in the long lean hands, which seemed all strenuous fingers, closed his mouth, clenched his teeth, drew back his thin fleshless lips, and rolled his eyes, as if trying to force speech from his labouring chest through his convulsed throat.

'What is it?' cried the old woman in impressive resolute tones. 'No one can hear you but me. Speak to me.'

Suddenly the teeth snapped open, and from the throat came, in a whispered guttural voice, the words: 'Ruin! I am ruined! I have lost all!'

As though the last word released some prodigious spring, the man flew up out of the chair, bent his head, and laughed with such overwhelm-

ing vigour that the old woman started back, raised her hands and uttered a wail. When the lungs of the man were empty, he doubled up, glanced wildly right and left, spread out his arms level with his head, spun round on his heel for a moment, and with a groan, fell to the floor.

'My child! My son! My pride! Is this the end? Is he dead?' moaned the mother, crying out this once from the secret core of her woman's heart. No paroxysm before had begun so or so ended. Through all the years of her life, even to her own ears her own voice had never so sounded. Hitherto, that woman's voice had been the voice of human wisdom: now for the first time it was the voice of a mother's soul. The brain had spoken all along till now; at last the heart had speech.

With amazing swiftness and agility, she reached the prostrate form. He was lying on his face, his arms spread wide. With incredible dexterity and strength she gathered in his outstretched arms and turned him over on his back. Her deft fingers loosed his collar and eased it round his short thick neck. She slipped her hand under his waistcoat and felt over his heart; and then, in a tone of rapturous gratitude that was a prayer, she raised her eyes upwards and whispered: 'Not dead!—not dead! He lives!'

She clasped her hands, and letting them hang down in front of her, sat back on her heels, regarding the dun face of the unconscious man as if it were a beatific vision. Then placing a hand on the floor at each side of the head, she bent slowly forward and kissed the forehead, whispering in the voice of one whose heart is heavy and rich with possession of a secure treasure: 'My child.'

She rose briskly, and pushed the thin strands of hair out of his eyes, and fetched a water-bottle from the table, and emptied it over the face and chest of the man.

With a shudder he opened his eyes. He looked around vaguely and passed a feeble, wavering hand over his face. 'Mother,' he said at length, seeing her standing over him, 'what is it?'

'You have had an attack,' she said as she replaced the water-bottle on the table.

He scrambled to rise. With nimble strength she helped him, as though she were once again the young matron, and he the blundering, ungainly, sole occupant of the nursery. She assisted him to a chair. He sat facing the light, with his back to the drooping form of the girl.

'This was more than a paroxysm. How came I on the floor?'

'You fainted at the end of the attack.'

'Did I blab?'

'You said,' she whispered, 'that there was ruin in the City.'

He groaned. 'Yes. Half-a-dozen great houses are gone, and I am pulled down, down, down, mother. You will spurn me. I did not keep to your advice. I speculated. I did not keep in with solid things. I hoped to win a fortune in a year. South America has been the ruin of me, as you said it would be of fools who trusted it. I trusted it. All is gone. I am a beggar, and you will cast me off.'

'Who cares about the City, since you live? A minute ago I thought you dead.'

He took a napkin from the table and wiped his face. He stared at her in amazement. Did his ears hear aright? or was she bereft of reason?

'Drink this wine,' she said, holding a glass towards him. He did as he was told, still keeping eyes of unspeakable wonder on her face. She went on as she took the empty glass from him: 'When you were in the paroxysm, I told you Miss Morton had come.'

'Oh ay,' said he, passing his hand across his forehead; 'I had forgotten she was to be here to-day. When I found out how things were in the City, I flew home. All the money, mother, all *your* money, and all the money it and your advice helped me to make, are swallowed up. Gone—gone—gone! and I shall be posted as a defaulter!'

'Hush!' said the old woman, laying her finger on her lip and pointing with her other hand at the girl. 'We are not alone. She, too, fainted.'

He started, turned round, and rose. 'She here all the time!' he whispered in dismay.

'Yes. Here unconscious all the time. We must see to her now,' whispered the old woman. 'You and I can talk over affairs later. All is not lost yet; all may still be saved.'

'Nothing can save me!'

'Who knows?'

'What could save me?'

The old woman again placed a warning finger on her lip, and pointed at the figure of the girl.

'She!' cried he in a whisper.

His mother nodded, and whispered: 'She and Christopher Morton's money.'

Mrs Bathurst poured water into a finger-glass and sprinkled some over Nellie's face. The eyelids trembled slightly, closed for a moment, then opened, closed again, and with a sigh the girl slipped from the support of the chair and slid to the table.

Mother and son bore the girl to a couch, dashed more water in her face, and chafed her hands. Once more the eyes opened, and a weak young voice said: 'Such a dream! Horrid dream! Did I faint?—Thank you; I am better now.'

'You fainted, dear,' said the old woman in a tone so gentle and tender, that her son could not believe his ears, and made sure his wits were wandering. Never before had he heard that voice but in cold approval, admonition, or command. 'Mr Bathurst was seized with one of the attacks I told you of, and the sight overcame you. The paroxysm is quite over now; my son is as well as ever; and in a little time you will be all right.'

'Have I been long unconscious?' asked the girl. 'I had a bad horrid dream, and it seemed days and days long.'

The old woman looked at the black marble clock on the mantel-piece. 'It is only ten minutes since my son knocked at the door; but in dreams, a moment of real time may seem a day—a year. What did you dream of, dear?'

'Oh, it is too horrible to think of. Pray, do not ask,' said the girl, to whom it began to seem that what she now took for a dream might be nothing but a distorted and exaggerated memory of what had really occurred. She sat

up and rose feebly. 'I—I think I will go to my room.'

'Let me help you,' said Mrs Bathurst, moving to the side of the couch.

'Oh, thank you—no,' said Nellie in distress; 'you are not strong yourself.'

'Not usually. Not at ordinary times; but to-day. Now I feel young and strong.' She put her arm round the young girl's waist, drew the slender drooping figure towards her own portly bulk, and led the way out of the room.

William Bathurst for a moment glanced round him, as though expecting to find other marvels in keeping with this sight. Then he threw up his hands in despair of understanding what he had seen, and muttering, 'What has wrought this miracle?' dropped into a chair.

Crushed and doubled up, the small man sat in the great chair. Ever since he had begun, as a lad of seventeen, to go to the City office in which the memory of his dead father had got him a clerkship, William Bathurst devoted himself heart and soul to business under the exacting guidance of his mother. He had always looked on her as the embodiment of worldly wisdom. She had been his guide through all these years. She had designed his future and nurtured his career. When he was old enough to start for himself, she had given him her money—he possessed none of his own—had mastered the business of the Stock Exchange more fully even than in her husband's days, as no woman had ever mastered it before, and while he acted upon her advice she had shown him the way to fortune. Of late he had strayed from her counsel, following great leaders in the world of finance, to the result of his present shipwreck.

But though he knew she had no thought of any living soul but himself, a word of tenderness had never passed between them in all these years. To his mind she was a woman whose whole soul was absorbed in gold-seeking; and as she could not engage in the quest herself, she had delegated to him the activities and the profits of the pursuit.

Within one hour, nay, ten minutes, she had made light of money, thrown off the physical ineptitude or lethargy of years, employed affectionate tones towards him, and spoken to this strange young girl, whom she had never seen before, words of endearment!

Only one explanation was possible: the news that disaster had fallen upon him had overthrown her reason.

'William!'

With a start, he looked up. He had not noticed her entrance. He saw standing over him the calm inscrutable mother of old. 'Yes, mother.'

'You say all is gone?'

'Everything—every shilling. Black ruin is in the City to-day.'

'Christopher Morton's money is safe?'

'Every penny.'

'Then Christopher Morton's daughter must save you. Morton's money would be enough?'

'It would be enough to tide me over; but, mother'—

'William, you took my advice most of your lifetime, and you prospered. You took your

own advice, and see what it has brought you. The very fates are playing into our hands. This morning, this girl comes to our door. She has no relative in Europe. This day, ruin faces you in the City. Poison and antidote. When I left you just now I *knew* this should be. I did not know how it was to be accomplished.'

'But, mother, there are he and she.'

The mother held out a paper to her son. 'I told you the fates were on our side. When I left this room I *knew* what must be, though I had no sure perception of how it was to be. You have full power to deal with Christopher Morton's property—have you not?'

'Yes, full power; but he is coming home in autumn.'

'He has gone home already. This has been sent out after you by special messenger from the office. I took it from the messenger in the hall as I passed through just now. Read!'

He took the telegram from her hand. 'Great powers above! Christopher Morton dead! Oh mother, I am sorry. This is worse than the crash to-day. The honestest gentleman that ever breathed! He came nearer to be a friend than any one else I know—than any one else I ever met.'

'Than your mother?' she asked coldly, severely.

'No—no! Why such a question? You were and are my all, mother; you know you are my all.'

'Listen,' she said sternly, undeviatingly. 'Return to the City, and bring Christopher Morton's money into instant use. Go at once, and arrange for your own extrication by that means.'

'But, mother, they would call my using his money by the name of a crime.'

'Who dares to inquire into the business relations between man and wife?'

'Man and wife! Do you mean that girl and me?'

'Go!'

'But mother!—'

'Go!' she hissed. 'Go and do what you can do, and I cannot. Go and realise; anticipate your wife's fortune. I cannot do that part of the work. Go you and do that; and when all is safe in town, come to me for your wife.'

THE POSTAL SYSTEM OF INDIA.

DURING the past year we heard a good deal as to our postal and telegraphic systems; but in all that was said and written no reference was made to systems in vogue in our colonies, certain arrangements in which we might do well to adopt. We propose in the present paper to deal more especially with the Postal Arrangements in India, comparing them with our own.

One of the most important and useful arrangements in India is that known as the 'Value-payable Post.' It is a system under which the post-office undertakes to deliver any parcels, registered letters, registered and fully prepaid, unregistered book-packets, and railway receipt notes, and to recover from the addressee on delivery a specified sum of money fixed by the sender, and to remit to the sender this sum, minus a commission, in the case of articles other than unregistered book-packets. For instance, a

resident in the northern parts of India can write to Calcutta and order a firm to send any articles of wearing apparel, books, or anything he or she may want. They at once send it; but before the parcel is delivered, the post-office is paid the value of the contents, or in other words the bill. When it is paid, the receipt and the money go back to Calcutta, and the firm receive the money from the post-office. In this way tradespeople can get no bad debts, and the recipients have no trouble except to pay at the door. The system has its drawbacks in one way, as tiresome tradespeople occasionally send the wrong article when they have not what is ordered; but the remedy is to return it value payable, and thus the money is sent back to those ordering. Goods and parcels not exceeding a thousand rupees in value, may be booked at any railway station for delivery from any railway station authorised to deliver goods and parcels under the value-payable system. Value-payable parcels cost exactly the same as if one paid the money by money order.

Value-payable articles may be insured up to the value of fifty pounds in branch offices, and up to the value of one hundred pounds in all other offices. The insurance is of two kinds—complete and partial. Complete insurance is intended to cover all risks during transit from the office of posting to the office of delivery. Partial insurance is intended to cover all risks during transit in British territory, and all risks during transit in native territory except those arising out of highway robbery. Partial insurance is only applicable in the case of transit of articles through certain native states. Certain offices in Kathiawar receive insured articles, but are not allowed to despatch them; and certain offices in Cutch are prohibited from despatching insured articles during the prevalence of the south-west monsoon. The value declared for insurance need not correspond with the amount specified by the sender for recovery from the addressee. For instance, in the case of a watch returned after repairs, per value-payable post, to its owner, the amount to be recovered from the owner of the watch would be only the cost of repairs, while the sum insured would represent the value of the watch itself. In our postal system we can only insure to the value of fifty pounds.

In India itself, parcels may be sent paid or unpaid, but not abroad. This is a convenience, and might well be introduced in England.

There are certain 'newspapers' sent by post in India which are known as 'privileged newspapers'—that is, newspapers on which postage has been prepaid under the following rules. The proprietor, manager, or publisher of any newspaper may arrange with the post-office to pay in cash, in advance for a given period, the amount of postage payable on the number of copies of such newspaper to be posted by him, for transmission by the inland post, during that period. These copies are then transmitted through the inland post as fully prepaid without having postage stamps affixed to them. The period for which the postage may thus be paid in advance is three months, or a shorter period.

Certificates of posting are not familiar to us; but in India they are granted to afford the public an assurance that letters and other articles entrusted to servants and messengers for posting

have actually been posted. The dishonesty of natives led to the introduction of these certificates; and doubtless in some cases in this country they would be found convenient. Any one who wishes to obtain a certificate of posting must send with the article for which the certificate is required an exact transcript of the address on the article, written in ink on a slip of paper or in a book, with a half-anna—equal to three farthings of our money—postage stamp affixed to the transcript. The postmaster or clerk to whom it is presented compares the addresses, and if there is no discrepancy, will obliterate the postage stamp and impress the post-office dated stamp on the slip of paper or book, which will then be returned as a certificate that the letter or other article has been posted. Then there are what are known as Postal Acknowledgments, which is to let the public know that the articles sent have reached the addressees. The articles for which acknowledgments can be obtained are registered letters and packets and ordinary parcels.

Money orders may be telegraphed in India to the amount of sixty pounds, whereas we can only telegraph to the amount of ten pounds. The telegraphic money-order system is restricted to inland money orders; but the remitter of a foreign money order can have the particulars telegraphed to the Indian office of exchange concerned; and that office will, on receipt of the telegraphic advice, issue a money order on the foreign country of payment under the foreign money-order rules.

The Savings-bank Department is managed in a somewhat simpler form than in England. One does not have to write to give notice for the withdrawal of money in India. The depositor presents his pass-book personally or by agent—whose name must be mentioned in the application for withdrawal—at the post-office at which his account stands, with a printed form of application for withdrawal, which can be obtained at the post-office, signed by himself, and showing the balance at his credit and the amount he wishes to withdraw. Interest is allowed at the rate of three and three-quarters per cent. per annum, whilst ours is but two and a half per cent.

In England, postmasters are not allowed to return any letter, parcel, or other postal packet to the writer or sender, or to any one else, or to delay forwarding it to its destination according to the address, even though a request to such effect be written thereon; but in India, letters, post-cards, books, and pattern packets and parcels can be recalled by the senders, after having been posted, subject to certain rules. No letters or articles posted may be returned except under the orders of the chief postal authority in a province, or the Director-general of the post-office, or the local government or administration, or the Governor-general in Council. A fee of one rupee is charged for the returning of a posted letter; and the application for the return must be accompanied by a statement of the reasons why return of the letter or article is sought. This power to the sender to recall letters or articles once posted is one which many would frequently like to be able to exercise. It must necessarily of course involve trouble and some

little delay to the sender as well as the postal authorities, but it is an advantageous innovation in the system.

The Indian post-office has in use some excellent embossed envelopes, which are found specially convenient for certain classes of correspondence. English as well as natives use them in great numbers, because they are not only convenient but attractive, for they cost nothing. They are oblong, and are sold at eight annas per packet of sixteen—that is, the envelope costs the purchaser nothing at all. The reason of this is probably due to the fact that natives will not put their letters in a decent covering, so these envelopes were introduced to give them no excuse for not sending their letters properly, instead of in a dirty wrapper made by themselves. The postal authorities have a better kind of embossed envelope which they do their best to tempt people to buy. These are square ones, and cost ten annas six pice per packet of sixteen.

In the foregoing, it has been our object merely to call attention to the main points of difference between the Indian and English systems, since in the majority of details the Indian system corresponds with our own, and it has therefore been unnecessary to dwell upon points with which we are already familiar. India has not only adopted all our improvements in postal matters, but has taken care to go farther and introduce improvements for her own good; and we think that as other countries have seen well to adopt any fresh innovations on our part, we might do well to look around and introduce further improvements now in vogue in other countries. Paris has long taken the lead of London in many matters of detail in their postal service, and the present year is a fitting year for us to make more ventures.

AN UNLOOKED-FOR TURN.

BY HENRY TINSON.

IN TWO CHAPTERS.—CHAP. I.

EVERYBODY in and around Churchborough sympathised heartily with poor old Mr Starbert when his eldest son made that imprudent, disgraceful match which went near breaking the old gentleman's heart, and probably did shorten his life. When we say 'everybody,' we approach literal correctness, for Churchborough, although a respectable and well-to-do sort of town, was small enough to make every incident a little out of the common the welcome subject of general gossip.

Young Edwy Starbert had given his father a great deal of trouble while he was at Oxford, which university he left in a manner anything but creditable; afterwards he gave more trouble still. His conduct was certainly bad enough, but rumour, as a matter of course, darkened and deepened even this. Then came the news that he had married a wife he could never bring home, not in his father's life; but he was the elder of his father's two sons, and some day he would be master. No one seemed to know exactly what his wife was or had been; yet every one agreed that she was somebody very

unfit to become Mrs Starbert. She was a barmaid—an actress—a tight-rope dancer—an assistant at a glove-shop—he had first seen her behind a tobacconist's counter: these were among the most favourable of the reports which reached Churchborough.

As for the young man himself, he, from all that was heard, was going from bad to worse; his father—so it was reported—had twice paid large sums to save him from criminal proceedings. It was a great comfort to think that the second son, Mr Dudley, was so steady, so different in every respect from Mr Edwy.

This second son was what is commonly described as 'something in the City,' which in his case involved also his being something on the Stock Exchange; and probably the business habits thus acquired had kept him from the glaring faults of his brother. Edwy had been prone to satirise 'old Duddy,' as he called him, and openly declared that the younger man was worse than himself at the core, and was only so smug, demure, and correct as a matter of prudence. 'He is playing his cards carefully, and will win the game, I daresay,' he was wont to say; but however this might be, poor Edwy did not live to see the end of the game. He died in London of 'a galloping consumption,' as those who were in attendance upon him described it; and such progress had the disease made, that although his friends hastened to town directly they heard of his illness, they were not in time to see him alive. The behaviour of his wife and her associates was so repellent, that old Starbert could not soften to the young woman, and at last had something like an open quarrel with her. There was therefore no reconciliation; and Mr Dudley—to whom must be given the chief credit of pointing out Mrs Edwy's faults, and indeed of stimulating them by a little judicious irritation—may be said to have won the game, as his brother had foretold.

The widow soon disappeared; it was reported that she had married a sergeant in the artillery, and gone out to India with him. It was from the inquiries of Mr Dudley that so much was learnt, the old gentleman scorning to interest himself about one whom he deemed had been the worst enemy of his house.

Well, Edwy was dead; Dudley had succeeded him, and was heir to the not very extensive property at Churchborough. Then he married. Discreet in this as in all beside, he chose a wife with some money. The lady possessed a bad temper; but she soon found her husband was, or could appear to be, impervious to the sharpest attacks of her tongue, and could control her so far as to prevent anything like an outbreak; but through the servants it was pretty generally known that Mr and Mrs Dudley Starbert did not get on very well together. This state of things could not be very pleasant to either; but the gentleman had soon additional cause for repining. Cautious, discreet, as he had always been, he had married his wife somewhat in haste, lest a delay might lose her—and her money. A delay of only six months would have changed his plans materially, for in that brief period a distant relation—one from whom the Starberts had no expectations—died, and left a considerable estate to the old gentleman upon the very easy

condition that the recipient should adopt his family name of Smithers. The bequest being in land, would of course have gone to Edwy had he lived, so Dudley might again be esteemed fortunate—but in secret he was bitterly chagrined when he reflected what sort of wife he might have chosen had he but waited until he attained such a position. He might have married so that he could have become the member for the county; might then—for he was ambitious, and had a sufficiently good opinion of himself—have even aspired to a seat in the cabinet. His ambition and his opinion of himself being thus tolerably high, he had courage enough to put this ambition to the trial, for a vacancy occurring in the representation of the county, Mr Dudley Starbert-Smithers offered himself as a candidate. As he set forth, when thus coming forward—as being his own—every principle which was likely to charm the constituency, and as he had, during the year or so in which he had held his wealth—for poor old Starbert did not live three months after the estate fell to him—been most lavish in his expenditure, he thought he had a good chance.

But he was not a generous or a genial man, and even this outlay, by fits and starts, was so managed as to offend more than he pleased; while the multitude would certainly never like Mr or Mrs Dudley. In short, he polled about two hundred votes, his antagonist scoring some two thousand; and as the trivial support obtained by Dudley was all from the section most objectionable in the eyes of county Squires, and only given to annoy these latter, why, Mr Starbert-Smithers was even less popular than before, and was decidedly 'snubbed' in many quarters. He, therefore, not unnaturally, resolved to quit Churchborough; and easily obtaining a tenant for his ancestral estate, which his grandfather had bought when retiring from the wholesale oil business, he found a suitable residence at a distance of fully one hundred miles from the ungrateful town. Here he seemed likely to be happier than before; for not only were his neighbours less fastidious than the Churchborough folk, and willing to exchange hospitalities with him, but an heir was born, which not only kept the Starbert-Smithers property in the right line, but naturally caused a more amicable feeling between the parents.

If this were a more detailed history of Mr Dudley's career, much could be said of the importance attached to this event, and how he at once seemed in consequence to feel himself of more weight among his neighbours and to lay himself out to acquire popularity. He was perhaps successful in some degree; but he was not a man to be liked all round; while his disposition to insist upon his rights brought him into collision with some of the less important classes, as he deemed them, in his vicinity.

Having bought a piece of land adjacent to his house, he was annoyed to find that trespasses were common, and that some of the trespassers asserted a right to cross the meadow and to fish in the stream which skirted it. Among these—almost alone, indeed, for most of the offenders were soon scared off, or did not think it worth while to run any risk for so trivial an object—was a man to whom Dudley had taken an immediate

and instinctive dislike—a shabby, elderly fellow, who had, it was said, been a schoolmaster or a lawyer's clerk, and who even now professed to eke out a living by giving lessons in extra school subjects, and by doing a little copying for some of the tolerably numerous attorneys in the neighbouring town.

Dudley had formed an opinion that this man was a poacher, even a thief, evidently a dangerous character. He was the more objectionable because he lived in a wretched hut built upon land which ought to belong to the recent purchase; but there was a long-standing wrangle about this. The useless corner was a sort of No Man's Land, and Dudley's lawyer said it would cost twenty times the worth of the plot to get the occupier out and establish a title. Yet, if this fellow could be got rid of, it might be possible to prevent any one else from coming, and the ground could be included with that to which it properly belonged. So ran Mr Starbert-Smithers' cogitations, and he resolved in some way to expel the man—perhaps to buy him off, although he did not greatly relish this latter idea.

Meanwhile, the schoolmaster lived in his wretched cottage, with only a child for his companion. An old woman, still poorer than himself, who lived in one room at a squalid hovel down the hill, used to attend upon the child, 'tidy up' the place, and do such cooking as was needed.

At last, chance seemed to favour Mr Starbert-Smithers. An extensive poultry robbery took place in the neighbourhood, and suspicion pointed to Silas Bird, the schoolmaster. Dudley was delighted at this, and spared no expense to bring the offence home to the man. He sent for an experienced criminal lawyer, offered a large reward for evidence, and was so sanguine of success that he arranged with his fellow-guardians for the reception of the poor child, who had no better home than Silas Bird's cottage, into the workhouse. But the prosecution failed in the most ignominious manner. The chief witness against Silas—who had had his first hearing before the magistrates, and came up on remand, a mere form before his committal, of course—this sheet-anchor of the prosecution was himself, unfortunately, identified as the thief; while Bird's alibi, which had been discredited and laughed at, was proved good.

The accused had learnt quite enough from his friends, who were sufficiently shrewd, even if disreputable in the eyes of Mr Starbert-Smithers, to teach him how much he was indebted to the latter; while much of that gentleman's antecedents had leaked out, and was now used with the most unfavourable colouring possible. Of this, however, Dudley knew nothing; nor did he know that Bird had gone straight from the court to his cottage, or he might have chosen some other way to his house. As it was, on turning an angle in the byroad which was his short-cut, he passed directly in front of the hut, and saw Bird standing in the doorway. The pair could have shaken hands, had they been so disposed.

Bird held the sickly child, a boy of some five years, by the hand, and as Mr Starbert-Smithers appeared, he lifted the child in his arms and said, pointing to Dudley: 'Look at that fine gentleman! Perhaps he would like to nurse you.' The 'fine gentleman' walked steadily on, taking

no notice of this speech beyond that which was contained in a stern frown; but a direct hail from the man caused him to pause.

'Mr Starbert,' exclaimed the schoolmaster, 'I must apologise for not having called upon you before this. I did not know until during the course of some events interesting to both of us, that Mr Smithers, our respected neighbour, was Mr Starbert of Churchborough. I shall take an early opportunity of calling upon you and asking after all our friends.—Good-afternoon, sir; do not let me detain you.'

With a harsher frown, Dudley went on, thoroughly vexed with himself for having stopped to listen, and mortified by thinking that he recognised in the man one of the Churchborough voters, but whether on his side or against him, he could not remember.

The incident disturbed him a good deal; for, knowing that he had been worsted in his plans, he knew also that there was a sneering triumph in every syllable the man had uttered, all the more insulting from its covert character. Meeting his son and the nurse outside his gates, however, he was restored to calmness. The child indeed was not only his pride but his solace, and those of his household who had been long with him were wont to say that 'master was quite a different man since Master Dudley was born;' for the baby was of course named after his father. If this had no other effect, it suggested a long line of ancestors—illustrious, perhaps noble.

He was able to make a jest of the meeting, in describing it to his wife; for all that, he detested the man, and was more than ever determined to put an end to his illegal squatting. Dinner was over, and Mr Starbert-Smithers was seated in his study, looking through some letters and accounts; these related chiefly to the late legal proceedings, so were not pleasant reading, when the servant brought in a card, and said: 'The—the gentleman was waiting.'

The card was in manuscript, and it bore 'Mr Silas Bird, accountant, &c. It was the cottager.

'Send the fellow away; I will not see him,' replied Dudley.

The servant left, but reappeared, and excused herself by saying that the visitor was most anxious to see Mr Smithers on business of the greatest importance, and he hoped no offence he had given would prevent his saying a few words to that gentleman. This sounded better; so, after a moment's hesitation, Dudley said: 'Show him in;' and accordingly the owner of the card appeared.

'Now, Bird,' began Mr Starbert-Smithers, in a decided tone, 'you say you wish to speak to me upon important business. What is it? Be brief, as I am busy.'

'I see you are, sir,' returned the man; 'and the envelopes being under my eyes, I cannot help recognising Hinger and Barkman's fine legal hand.'

Dudley angrily snatched away the papers as this was said.

'Do not mind it,' continued his visitor; 'the firm may be said to have introduced us to each other.—Now, Mr Dudley-Starbert'—his voice changed here so sharply, that his listener could not avoid looking full at him—'I am here on

business. I mean business; I will have business; and if you will not meet me in the business as I wish, I will crush you; yes, sir, I—will—crush—you.' He leant forward and almost hissed these last words out.

'What do you mean, fellow?' cried Dudley, indignant at the man's manner. 'Do you threaten me? Come here when you are sober, if you come at all. Leave my house, or I will myself turn you out.'

'Will you, Mr Starbert?' retorted the other, with a malignant grin. 'You are a ruined, a hopelessly ruined man, if you do. Now, I want to be your friend, if you will be sensible, and allow me. Did you see the child I held up to admire you to-day?—Do not scowl, but answer a civil question, the only one, I promise you, that I will ask.'

'I did. What then?' asked Dudley; exasperated, yet in some vague way uneasy at the man's strange speech.

'Good. I held him up to admire his uncle, Mr Dudley Starbert-Smithers,' resumed the schoolmaster.—'Oh yes, I am in earnest. He is your nephew—the wronged, neglected child of your wronged brother, Mr Edwy, the heir to the Churchborough property, which was hardly worth fighting for; and the heir to your inherited estate, which is. One moment more! I am not a grasping or unfeeling man. You have tried to ruin me, to send me to Portland; and some men would cherish ill-will for this; but with me it is different; forget and forgive is my motto. If you think you can dispute the parentage of this boy, do so. I shall not blame you; but you will fail; I tell you that candidly; and when you have failed, you will beg for the terms I now offer.'

'If you are not out of this house in two minutes, you shall be pitched out neck and crop,' returned Dudley. 'Those are *my* terms.'

'I will go, sir,' answered Bird. 'An action for assault might have been useful to me a week or two back; I can do without it now. It will not hurt you, sir, to look through these few papers,' he laid a large envelope on the table as he spoke; 'and please note that when we might claim the whole, I am content with half.—Good-night, sir; I will give your love to your nephew.'

THE LAST OF ENGLAND.

THE white cliffs fade into the twilight gray:

A mist now hides them from my tear-dimmed eyes;

For swiftly onward, as a bird that flies,

The good ship sails—and England's far away;

And far behind, my childhood's happy day,

And sweet girl-comrades, whose dream-faces rise

To haunt and cheer me under alien skies.

O friends and country, fare ye well for aye!

But while love leads me o'er the stormy sea,

Though English homesteads I see nevermore,

Long years of blessing fate may hold in store:

For hands can work when hearts from care are free.

Hope's heaven-sent sunshine gilds with memory

The new life waiting on the distant shore.

SATURDAY, FEBRUARY 20, 1892.

PRICE 1½d.

THE LADIES' GALLERY.

BIG Ben is striking two, and if we intend to secure good seats we must hurry. Breathless with haste, we reach the little door through which it is necessary to pass to gain the Ladies' Gallery. Here a stern policeman stands guard, who demands the name of the member whose order we hold. Having inscribed this on a sheet of blue paper, he ushers us into a little dark waiting-room, where we must sit and possess our souls in patience for more than half an hour. The 'House' meets at three, and the door of the Ladies' Gallery is opened a quarter of an hour before that time; but in order to obtain seats in the front row, it is best to appear on the scene not long after two o'clock, or, on very special nights, even earlier than that. Wearily the time drags along; unless, warned by previous experience, we have provided ourselves with literature of some kind, there is nothing for it but to wait as cheerfully as we may, deriving some information and amusement at least from the behaviour of our fellow-victims. With what envied ease those who possess a personal and domestic interest in some of the members comport themselves. How calmly they converse with each other on their private affairs, in not always modulated tones. Look at those girls, how shy and excited they seem; they have never been here before, it is clear. Some of these ladies have visited the House so often that it is now almost a bore to come, at least they no longer feel any enthusiasm over it. Others are enjoying the pleasant excitement of a new experience; while others, again, are still placidly interested and curious, although the novelty of the thing has worn off. Ladies of all kinds, in short, are to be seen here from time to time—political, fashionable, young and old, and dames that are nondescript.

At length the guardian policeman puts his head in at the door and announces that we can now receive our tickets. In the order, then, of our arrival, numbered white bone or ivory discs

are presented to us, and with these in our hands we commence to climb the stairs. Three long steep flights there are, and each step of the last flight at least is accompanied by sighs for a lift. Passing through the swing-door at the top, we find ourselves in the midst of a long bare corridor with swing-doors at each end. Through that on our right hand men with a business-like air and sheets of white paper in their hands, occasionally pass and repass. These are the reporters of various newspapers on their way to and from the Reporters' Gallery, which lies immediately in front of and below the one set aside for ladies.

The entrance to the Ladies' Gallery itself is on the other side of the corridor from the one at which we entered, and a little lower down to the right. But there are still some minutes to pass before the magic door is opened. Novices in the ways of the place generally plant themselves as close to the door as possible, in the hope of rushing in first. Vain delusion! The numbers on their tickets betray them, and the courteous official in charge gently relegates them to their own place. There are only eighteen seats in the gallery in all, and these are divided into two rows, the back one being raised a step higher than the front. In spite of this, a position in the second row is not much to be coveted, as from it little can be seen of the House, except by standing up and craning over the heads of those seated below. In the front row the case is quite different; there you can draw your chair close up to the oft complained-of, over-abused grating, and look down comfortably upon all that passes. As regards the said grating, it really is not so bad as it has been painted. Its meshes are wide, and, beyond rendering the gallery rather dark, and producing a slight sensation as of a veil continually before the eyes, it interferes not at all with the comfort of those seated behind it, or with the view they obtain.

At present the House is almost entirely empty. A few officials stand idly near the door, an odd member or so wanders aimlessly in, gazes about him vaguely for a few moments, deposits a hat on

a chosen seat, and wanders out again. It is not yet three o'clock.

We look about us for a while. The Ladies' Gallery is set far back, and commands a view of almost the entire hall. On the right, between the end of the Ladies' Gallery and the wall, is the Speaker's Gallery, which of course we cannot see. Just below is the Reporters' Gallery, extending the whole width of the House and a little round on each side. It is divided into a number of small compartments, just large enough to hold one man, who enters from the back, steps down, shuts himself in, and sits like a Jack-in-the-Box. Over the edge of this gallery appears the green canopy of the Speaker's Chair, which will effectually screen him from our view when he is seated beneath. In front of the chair stands a big table, covered with books, pamphlets, &c. This is the Clerks' Table, and along the foot of it, presently, the glittering mace will be laid. The members' benches are on either side, the front Ministerial and Opposition benches facing the table on the right and left hand of the Speaker respectively. A narrow gangway on both sides of the House divides the front benches and those immediately behind them from the rest. Benches, therefore, below this are 'below the gangway.' The principal entrance to the House is through a wide door facing us, on either side of which are the 'cross-benches,' extending as far as the 'bar of the House.' From where we sit, the brass knobs of the latter can only just be faintly discerned sticking out from the ends of the nearest cross-bench on each side. Here, too, is placed the big elbow-chair of the Serjeant-at-Arms. Above the doorway and over the cross-benches are the galleries for Peers and Strangers, the latter generally well filled. Galleries also extend along the sides of the House for the use of members; on the night of a great debate these are full to overflowing, but at other times frequently empty.

At length, on the stroke of three, the cry of 'Speaker!' is raised in the lobbies without, and presently the doors are swung back, and the great man appears in his wig and gown. Preceded by the serjeant-at-arms bearing the mace, and followed by the chaplain, he passes towards the chair, bowing right and left at every step. The doors are then closed, and prayers are read by the chaplain. During this ceremony the few members present fidget somewhat after the manner of schoolboys on a similar occasion.

Then comes 'Question-time.' This lasts a longer or shorter period, according to the number and character of the questions honourable members desire to ask those in authority. It is no doubt a most useful indispensable institution; but 'Question-time' is nevertheless, as a rule, rather dull, though sometimes enlivened by a sharp skirmish between smart speakers on both sides of the House.

A slight pause precedes the commencement of

the serious business of the day. The benches are by this time fairly well filled, and a slight rustle goes through the assembly as the first speaker rises to address the House on the matter in hand. On the night of a big speech by some leading orator and statesman, the House of Commons is indeed a sight worth seeing. The floor and galleries are crammed, not a vacant seat to be found anywhere; the members are disposed in various attitudes, characteristic or peculiar, yet all listening intently. At one moment a stillness deep as death may prevail, broken only by that one voice ringing through the room, sweeping its hearers along in a tide of eloquence, swaying them this way and that with its persuasive eloquence. The next—some chance word of the orator breaks the spell—a storm arises; cheers, counter-cheers, calls and other expression of accord or dissent. 'Order! Order! Order!' 'Hear! Hear! Hear!' roll like waves of sound from one end of the building to the other. The wildest confusion of voices obtains, and it is some time before the tumult is stayed. Such a scene is superb but indescribable.

How great, then, is the contrast when some prosy individual holds the floor, boring the House with his especial fad. Rapidly the seats empty; one by one the members steal away; while those who remain to suffer martyrdom for the sake of 'keeping a house' stretch themselves comfortably to sleep if they can. Occasionally a stray member or two peeps in, listens for a few minutes, then hurries away; sometimes one look at the speaker is a sufficient reason for beating a hasty retreat.

It is while a particularly pronounced specimen of the latter type of orator is holding forth that we retire for afternoon tea. On the fine bright afternoons of summer, gallant members are wont to entertain their lady-friends to tea on the terrace, which runs along by the river. Here we can sit and see the boats glide up and down the Thames, or watch the living stream passing ceaselessly over Westminster Bridge. On such an occasion as this the terrace is a pretty sight; the gay hues of the ladies' dresses brighten the sombre stone walls and add picturesqueness to the scene. Talk and laughter float lightly round, forming a merry accompaniment to the demolition of cake and strawberries. Our staid legislators for the time being have laid aside the cares of the State. But to-day the harmony is not destined to remain undisturbed. The division bell rings imperatively, attendants appear to shout the summons in our deafened ears, members depart hastily, and for a while the ladies are left forlorn.

After tea, before returning to the gallery, a walk through the building is proposed by our entertainer. So away we go through corridors and up staircases, mazy and bewildering to the stranger. Every now and again we catch glimpses of inviting-looking reading and smoking rooms,

whither we may not enter; but at length our pilgrimage ends in the waiting-lobby outside the Hall of the Commons. Between the outer and inner doors of the entrance to the latter is a little seat in the left-hand corner. To this we are conducted, and standing on it in turn, peep through the little glass window into the House. Now at last we see the Speaker seated in state, get a near view of a gesticulating orator, scan the green leather-covered benches and the rows of faces, inspect the 'bar of the House,' glance upwards to the bars of the Ladies' Gallery, and descry dim forms within. This peephole is very enticing; but we must tear ourselves away, and once more mounting the weary stairs, find our way back to our old places.

The House has wakened up over some question, and a lively debate is in process, amid much laughter, cheering, and cries of 'No! No!' Then comes the shout 'Divide! Divide!' It is a great misfortune that from our present position we cannot hear the words of the Speaker very well, but we manage to make out that he puts the question, that there is a shout of Aye! on the one hand, and of No! on the other, and then the Speaker announces that the Ayes! have it. 'No!' is shouted again. So an adjournment to the lobbies is necessary to settle the matter. A pause ensues, during which we can hear the attendants calling 'Division!' from lobby to lobby, till the sound dies away in the distance. Members drawn from various occupations, and from remote parts of the building, come sauntering or hurrying in. There is a moment of expectation before the Speaker puts the question for the second time, and the same performance is repeated as at first. 'Ayes to the right, Noes to the left,' says the Speaker, and the members file out. It is curious and interesting to watch the various methods of progression adopted: some saunter languidly; others move with a quick, brisk, decided step; many join in groups of two or three to hold an earnest conversation as they pass out; a few rush out the instant the word is given; far more hang back till the House is nearly empty before they slowly take their departure. The lobby without is then cleared and the doors locked. Presently, a thin stream of men begins to come back, while the sound of a teller's voice falls faintly on our listening ears. At last all are counted, and the four tellers forming into line, march up to the table, bow to the Speaker, one of the tellers on the winning side announces the numbers, and the episode is over.

Soon after half-past seven we descend for dinner to a dining-room overlooking the terrace. Here members may only dine when they are accompanied by ladies. At this hour numerous ladies in evening dress are to be met with flitting about the corridors and staircases, while cosy parties assemble in the privileged dining-rooms. The House is becoming more and more a dining club for ladies since the fair sex is so ungallantly excluded from other clubs in London. Dinner over, we adjourned to the terrace for coffee. The night was soft and balmy, the lights were gleaming far along the embankment; and the scene was even more picturesque than by day. It is not till eight o'clock that the Speaker adjourns for his dinner; but he had long been back at

his duties again, before we even thought of wending our way once more to our seats in the gallery.

After the cool air of the terrace, the gallery felt hot, stuffy, and dull, particularly as the debate had once more settled down into a semi-somnolent condition. Our eyes and thoughts wandered, and fell on the reporters, still scribbling or occasionally snoozing at their posts. Did they get very cramped, we wondered, sitting in that confined position? We ourselves were nearly asleep, and began to make preparations for departure. One more look at the House first. Let us see how many members are taking a nap. What a lot of bald heads there are among them. Shining crowns are very much in the ascendant here. Is it because they keep their hats on so much?

But, dear me! how few members there are—surely not forty. At this moment a member rises, and with what looks like a slightly malicious smile on his face, remarks, 'Mr Speaker, I beg to call your attention to the fact that there are not forty members in the House.' But the words arouse no stir; there is no crowding of members back to the scene. The thing has either been pre-arranged or there is no interest in prolonging the sitting further that night. Slowly the Speaker begins to count: 'One, two'—There are not indeed forty members present. It is a 'Count out.' All is over for that night. 'Who goes home?'

THE IVORY GATE.*

By WALTER BESANT.

CHAPTER V.—SOMETHING HAPPENS.

So far a truly enjoyable Sunday. To sit in church beside her angry mother, both going through the forms of repentance, charity, and forgiveness: and to dine together, going through the ordinary forms of kindness while one at least was devoured with wrath. Waste of good roast lamb and gooseberry tart!

Elsie spent the afternoon in her studio, where she sat undisturbed. People called, but her mother received them. Now that the last resolution had been taken: now that she had promised her lover to brave everything and to live the simplest possible life for love's sweet sake, she felt that sinking which falls upon the most courageous when the boats are burned. Thus Love makes loving hearts to suffer.

The evening, however, made amends. For then, like the housemaid, who mounted the area stair as Elsie went down the front-door steps, she went forth to meet her lover, and in his company forgot all her fears. They went to church together. There they sat side by side, this church not having adopted the barbarous custom of separating the sexes—a custom which belongs to the time when women were monkishly considered unclean creatures, and the cause, to most men, of everlasting suffering, which they

* Copyright 1892 in the United States of America by Harper & Brothers.

themselves would most justly share. This couple sat hand in hand: the service was full of praise and hope and trust: the Psalms were exultant, triumphant, jubilant: the sermon was a ten minutes' ejaculation of joy and thanks: there was a Procession with banners, to cheer up the hearts of the faithful—what is Faith without a Procession? Comfort stole back to Elsie's troubled heart: she felt less like an outcast: she came out of the church with renewed confidence.

It was still daylight. They walked round and round the nearest Square. Jane the housemaid and her young man were doing the same thing. They talked with confidence and joy of the future before them. Presently the rain began to fall, and Elsie's spirits fell too.

'George,' she said, 'are we selfish, each of us? Is it right for me to drag and keep you down?'

'You will not. You will raise me and keep me up. Never doubt that, Elsie. I am the selfish one because I make you sacrifice so much.'

'Oh! no—no. It is no sacrifice for me. You must make me brave, George, because I am told every day by Hilda and my mother the most terrible things. I have been miserable all day long. I suppose it is the battle I had with my mother yesterday.'

'Your mother will be all right again as soon as the thing is done. And Hilda will come round too. She will want to show you her new carriage and her newest dress. Nobody admires and envies the rich relation so much as the poor relation. That is the reason why the poor relation is so much courted and petted in every rich family. We shall be the poor relations, you know, Elsie.'

'I suppose so. We must accept the part and play it properly.' She spoke gaily, but with an effort.

'She will give you some of her old dresses. And she will ask us to some of her crushes; but we won't go. Oh! Hilda will come round. As for your mother'—He repressed what he was about to say. 'As for your mother, Elsie, there is no obstinacy so desperate that it cannot be softened by something or other. The constant dropping, you know. Give her time. If she refuses to change—why—then'—again he changed the words in time—'dear child, we must make our own happiness for ourselves without our own folk to help us.'

'Yes; we will. At the same time, George, though I am so valiant in talk, I confess that I feel as low as a schoolboy who is going to be punished.'

'My dear Elsie,' said George with a little exasperation, 'if they will not come round, let them stay flat or square, or sulky, or anything. I can hardly be expected to feel very anxious for a change of temper in people who have said so many hard things of me. To-morrow, dear, you shall get through your talk with Mr Dering. He's as hard as nails; but he's a just man, and he is sensible. In the evening, I will call for you at nine, and you shall tell me what he said. In six weeks we can be married. I will see about the banns. We will find a lodging somewhere, pack up our things, get married, and

move in. We can't afford a honeymoon, I am afraid. That shall come afterwards when the ship comes home.'

'Yes. When I am with you I fear nothing. It is when you are gone: when I sit by myself in my own room, and know that in the next room my mother is brooding over her wrath and keeping it warm—that I feel so guilty. To-night, it is not that I feel guilty at all: it is quite the contrary; but I feel as if something was going to happen.'

'Something is going to happen, dear. I am going to put a wedding ring round this pretty finger.'

'When one says something, in the language of superstition one means something bad, something dreadful, something that shall stand between us and force us apart. Something unexpected.'

'My child,' said her lover, 'all the powers of all the devils shall not force us apart.' A daring and comprehensive boast.

She laughed a little, lightened by words so brave. 'Here we are, dear,' she said, as they arrived at the house. 'I think the rain means to come down in earnest. You had better make haste home. To-morrow evening at nine, I will expect you.'

She ran lightly up the steps and rang the bell: the door was opened: she turned her head, laughed, waved her hand to her lover, and ran in.

There was standing on the kerb beneath the street lamp a man apparently engaged in lighting a cigar. When the girl turned, the light of the lamp fell full upon her face. The man stared at her, forgetting his cigar light, which fell burning from his hand into the gutter. When the door shut upon her, he stared at George, who, for his part, his mistress having vanished, stared at the door.

All this staring occupied a period of at least half a minute. Then George turned and walked away: the man struck another light, lit his cigar, and strode away too, but in the same direction. Presently he caught up George and laid a hand upon his shoulder.

'Here, you sir,' he said gruffly; 'I want a word with you before we go any further.'

George turned upon him savagely. Nobody likes a heavy hand laid upon the shoulder. In the old days it generally meant a writ and Whitecross Street and other unpleasant things.

'Who the devil are you?' he asked.

'That is the question I was going'—He stopped and laughed.—'No—I see now. I don't want to ask it. You are George Austin, are you not?'

'That is my name. But who are you—and what do you want with me?'

The man was a stranger to him. He was dressed in a velvet coat and a white waistcoat: he wore a soft felt hat; and with the velvet jacket, the felt hat, and a full beard, he looked like an artist of some kind. At the end of June it is still light at half-past nine. George saw that the man was a gentleman: his features, strongly marked and clear cut, reminded him of something—but vaguely; they gave him the common feeling of having been seen or known at some remote period. The man looked about thirty, the time when the physical man is at his

best: he was of good height, well set up, and robust. Something, no doubt, in the Art world: or something that desired to appear as if belonging to the Art world. Because, you see, the artists themselves are not so picturesque as those who would be artists if they could. The unsuccessful artist, certainly, is sometimes a most picturesque creature. So is the Model. The rags and duds and threadbarity too often enter largely into the picturesque. So with the plough-boy's dinner under the hedge, or the cottier's Saturday night. And the village beershop may make a very fine picture; but the artist himself does not partake in those simple joys.

'Well, sir, who are you?' George repeated as the other man made no reply.

'Do you not remember me? I am waiting to give you a chance.'

'No—certainly not.'

'Consider. That house into which you have just taken my—a young lady—does it not connect itself with me?'

'No. Why should it?'

'Then I suppose that I am completely forgotten?'

'It is very strange. I seem to recall your voice.'

'I will tell you who I am by another question. George Austin, what in thunder are you doing with my sister?'

'Your sister?' George jumped up and stared. 'Your sister? Are you—are you Athelstan come home again? Really and truly—Athelstan?'

'I am really and truly Athelstan. I have been back in England about a fortnight.'

'You are Athelstan?' George looked at him curiously. When the reputed black-sheep comes home again, it is generally in rags with a long story of fortune's persecutions. This man was not in the least ragged. On the contrary, he looked prosperous. What had he been doing? For, although Elsie continued passionate in her belief in her brother's innocence, everybody else believed that he had run away to escape consequences, and George among the number had accepted that belief.

'Your beard alters you greatly. I should not have known you. To be sure it is eight years since I saw you last, and I was only just beginning my articles when you—left us.' He was on the point of saying 'when you ran away.'

'There is a good deal to talk about. Will you come with me to my rooms? I am putting up in Half Moon Street.'

Athelstan hailed a passing hansom and they drove off.

'You have been a fortnight in London,' said George, 'and yet you have not been to see your own people.'

'I have been eight years away, and yet I have not written a single letter to my own people.'

George asked no more questions. Arrived at the lodging, they went in and sat down. Athelstan produced soda and whisky and cigars.

'Why have I not called upon my own people?' Athelstan took up the question again. 'Because, when I left home I swore that I would never return until they came to beg forgiveness. That is why. Every evening I have been walking outside the house, in the hope of seeing some of them without their seeing me. For, you see,

I should like to go home again; but I will not go as I went away, under a shameful cloud. That has got to be lifted first. Presently I shall know whether it is lifted. Then I shall know how to act. To-night, I was rewarded by the sight of my sister Elsie, walking home with you. I knew her at once. She is taller than I thought she would become when I went away. Her face hasn't changed much, though. She always had the gift of sweet looks, which isn't quite the same thing as beauty. My sister Hilda, for instance, was always called a handsome girl, but she never had Elsie's sweet looks.'

'She has the sweetest looks in the world.'

'What are you doing with her, George Austin, I ask again?'

'We are engaged to be married.'

'Married? Elsie married? Why—she's—well—I suppose she must be grown up by this time.'

'Elsie is very nearly one-and-twenty. She will be twenty-one to-morrow.'

'Elsie going to be married. It seems absurd. One-and-twenty to-morrow. Ah!' He sat up eagerly. 'Tell me, is she any richer? Has she had any legacies or things?'

'No. How should she? Her *dot* is her sweet self, which is enough for any man.'

'And you, Austin. I remember you were an article clerk of eighteen or nineteen when I went away—are you rich?'

Austin blushed. 'No,' he said; 'I am not. I am a managing clerk at your old office. I get two hundred a year, and we are going to marry on that.'

Athelstan nodded. 'A bold thing to do. However—Twenty-one to-morrow—we shall see.'

'And I am sorry to say there is the greatest opposition—on the part of your mother and your other sister. I am not allowed in the house, and Elsie is treated as a rebel.'

'Oh! well. If you see your way, my boy, get married, and have a happy life, and leave them to come round at their leisure. Elsie has a heart of gold. She can believe in a man. She is the only one of my people who stood up for me when they accused me without a shadow of proof of—The only one—the only one. It is impossible for me to forget that—and difficult,' he added, 'to forgive the other thing.—Is my sister Hilda still at home?'

'No. She is married to Sir Samuel, brother of your Mr Dering. He is a great deal older than his wife; but he is very rich.'

'Oh!—And my mother?'

'I believe she continues in good health. I am not allowed the privilege of calling upon her.'

'And my old chief?'

'He also continues well.'

'And now, since we have cleared the ground so far, let us come to business. How about that robbery?'

'What robbery?' The old business had taken place when George was a lad just entering upon his articles. He had ceased to think of it.

'What robbery? Man alive!'—Athelstan sprang to his feet—'there is only one robbery to me in the whole history of the world since men and robberies began. What robbery? Look here, Master George Austin, when a man is

murdered, there is for that man only one murder in the whole history of the world. All the other murders, even that of Abel himself, are of no concern at all—not one bit. He isn't interested in them. They don't matter to him a red cent. That's my case. The robbery of eight years ago, which took a few hundred pounds from a rich man, changed my whole life: it drove me out into the world: it forced me for a time to live among the prodigals and the swine and the husks. It handed me over to a thousand devils, and you ask me what robbery?

'I am very sorry. It is now a forgotten thing. Nobody remembers it any more. I doubt whether Mr Dering himself ever thinks of it.'

'Well, what was discovered after all? Who did it?'

'Nothing at all has been discovered. No one knows to this day who did it.'

'Nothing at all?—I am disappointed. Hasn't old Checkley done time for it? Nothing found out?'

'Nothing. The notes were stopped in time, and were never presented. After five or six years, the Bank of England gave Mr Dering notes in the place of those stolen. And that is all there is to tell.'

'Nothing discovered! And the notes never presented? What good did the fellow get by it, then?'

'I don't know. But nothing was discovered.'

'Nothing discovered!' Athelstan repeated. 'Why, I took it for granted that the truth had come out long since. I was making up my mind to call upon old Dering. I don't think I shall go now.—And my sister Hilda will not be coming here to express her contrition. I am disappointed.'

'You can see Elsie if you like.'

'Yes—I can see her,' he repeated.—'George'—he returned to the old subject—'do you know the exact particulars of that robbery?'

'There was a forged cheque, and the Bank paid it across the counter.'

'The cheque,' Athelstan explained, 'was made payable to the order of a certain unknown person named Edmund Gray. It was endorsed by that name. To prove that forgery, they should have got the cheque and examined the endorsement. That was the first thing, certainly. I wonder how they began.'

'I do not know. It was while I was in my articles, and all we heard was a vague report. You ought not to have gone away. You should have stayed to fight it out.'

'I was right to give up my berth after what the chief said. How could I remain drawing his pay and doing his work, when he had calmly given me to understand that the forgery lay between two hands, and that he strongly suspected mine?'

'Did Mr Dering really say so? Did he go so far as that?'

'So I walked out of the place. I should have stayed at home and waited for the clearing up of the thing, but for my own people—who—will you know— So I went away in a rage.'

'And have you come back—as you went—in a rage?'

'Well—you see. That is the kind of fire that keeps alight of its own accord.'

'I believe that some sort of a search was made for this Edmund Gray; but I do not know how long it lasted or who was employed.'

'Detectives are no good. Perhaps the chief didn't care to press the business. Perhaps he learned enough to be satisfied that Checkley was the man. Perhaps he was unwilling to lose an old servant. Perhaps the villain confessed the thing. It all comes back to me fresh and clear, though for eight long years I have not talked with a soul about it.'

'Tell me,' said George, a little out of sympathy with this dead and buried forgery—'tell me where you have been—what you have done—and what you are doing now.'

'Presently—presently,' he replied with impatience. 'I am sure now that I was wrong. I should not have left the country. I should have taken a lodging openly, and waited and looked on. Yes; that would have been better. Then I should have seen that old villain, Checkley, in the dock. Perhaps it is not yet too late. Still—eight years. Who can expect a commissionaire to remember a single message after eight years?'

'Well—and now tell me,' George asked again, 'what you have been doing.'

'The black-sheep always turns up, doesn't he? You learn at home that he has got a berth in the Rocky Mountains; but he jacks it up and goes to Melbourne, where he falls on his feet; but gets tired, and moves on to New Zealand, and so home again. It's the regular round.'

'You are apparently the black-sheep whose wool is dyed white. There are threads of gold in it. You look prosperous.'

'A few years ago I was actually in the possession of money. Then I became poor again. After a good many adventures I became a journalist. The profession is in America the refuge of the educated unsuccessful, and the hope of the uneducated unsuccessful. I am doing as well as journalists in America generally do: I am over here as the representative of a Francisco paper. And I expect to stay for some time—so long as I can be of service to my people. That's all.'

'Well—it might be a great deal worse. And won't you come to Pembroke Crescent with me?'

'When the cloud is lifted: not before. And—George—not a word about me. Don't tell—yet—even Elsie.'

ART IRONWORK.

AMID the increased attention which has of recent years been given to all branches of decorative art, that of the artistic treatment of Iron has not escaped notice. The blacksmith occupied an important position among the craftsmen of the middle ages. The insecurity of life and property, which was one of the chief grievances of the times, made strength of material indispensable, whether to guard the shrine of a saint, or to protect after a more homely fashion the family chest or coffer. The strength and durability of iron led to its use for these defensive purposes from early times. But the workman of the middle ages was not content to allow strength

and ugliness of form to go together, but contrived to breathe a spirit of beauty into his designs without sacrificing the use to which the material was destined. Thus wrought-iron formed the object of much artistic work both in England and abroad. Until coal came into general use, malleable iron was produced direct from the ore with charcoal fuel by continuous working. Sussex was from early times a chief seat of the iron industry. The earliest positive record of the trade there is contained in a grant made by King Henry III. to the town of Lewes in 1266, by which the inhabitants were empowered to raise toll for the repair of the town walls after the battle. Every cart-load of iron destined for sale which came from the neighbouring 'weald' was to pay one penny toll, and every horse-load of iron half that sum. In 1290 a sum of money was paid to a certain Master Henry of Lewes for the ironwork to the monument of Henry III. in Westminster Abbey, which reminds us that talented smiths were brought often from long distances for important works.

In this country, perhaps the oldest existing works in iron are hinges to doors, strengthening bars, handles, escutcheons, lock-plates, and the like. Even the nails were things of beauty. Abroad, the massive doors of the cathedral of Notre-Dame de Paris offer a wonderful example of early ironwork. Probably designed in the twelfth century, the doors are nearly concealed with their decoration of trees and birds, dragons, and other grotesque beings. The door in St George's Chapel, Windsor, is of about the same date. The grotesque knocker on the Sanctuary door of Durham Cathedral, which bears a rather distant resemblance to a lion, is said to be of the twelfth century. The hollows for the eyes may have been formerly filled with crystal or enamel; or, as it has been suggested, the open eyes may have been contrived to emit light from within the church, so as to guide the hapless being seeking sanctuary by night to the welcome haven of safety.

The door of the chapter-house of York Cathedral is a good example of the work of the thirteenth century. It consists of a central stem, and several large scrolls with diminutive leaves branching out in all directions. Some chests in the same cathedral are also finely bound with decorative hinges. Occasionally, hinges were gilt, and not laid directly on the wood, but on skin or scarlet felt. These elaborate fastenings, however, fell into disuse in the fifteenth and sixteenth centuries, when the woodwork of doors became richly moulded and carved. The number of iron pieces on a door furnished the French dramatist Sedaine with the subject of an amusing scene in the play of the *Gageure Imprévue*—brought out in 1768—in which a Marquis, one of the chief characters, bets that he will enumerate all the bits of iron big and little which are employed in the construction of a door—such as lock, screws, nuts, knobs, bars, bolts, and so forth. He succeeded in naming them all except the key, and so eventually lost his bet. The old process of repeatedly forging the iron gave it a great tenacity and ductility, which modern iron, except of the finest quality, does not possess.

In early times, the iron was not actually made to melt, but was separated out and formed into

a lump while in a pasty condition, when it was found to be sufficiently free from carbon to be malleable without further processes. It was then accordingly brought under a heavy tilt-hammer, worked by a cog-wheel and driven by water-power. Sheets of water in the Weald of Sussex and in Kent owe their existence to the manufacture of iron; while other pools and ponds have been drained and transformed into hop gardens or osier beds. Corn-mills, too, often occupy the sites where once the din of the hammers resounded. The iron was eventually formed into bars by beating under the hammer, and then worked into the sizes required by the smith. When this had been done, the artistic part of his work, such as welding, stamping, and chiselling, still remained. In the larger specimens of ancient work some parts are additions entirely welded; others are additions fastened at the ends by bands welded across the groundwork. Sheet-iron, which had been introduced into England by the fourteenth century, saved much labour, and could be elaborately decorated.

Italy in the middle ages led the way in metal-working as well as in other arts. In bronze, the work then produced has never been equalled. During the thirteenth and fourteenth centuries, wrought-iron came into general use for screens, for chapels and tombs, and grills for windows. The screen around the tombs of the Scala family at Verona is composed of a kind of network of quatrefoils, each filled up with a small ladder (*scala*), in allusion to the family name. Several churches in Florence and Siena have magnificent screens of wrought-iron. One of the principal workers of iron of this period was Niccolò Grossi, who was taken under the patronage of Lorenzo de' Medici. Candlesticks, lanterns, cressets, and torch-bearers were produced in large numbers—all of the most artistic designs. Grossi executed four lanterns for the Strozzi Palace at Florence, which were set up in the year 1500; and each cost a hundred florins for workmanship alone. Another artist in iron was Cozzarelli, who flourished at the close of the fifteenth century at Siena, and distinguished himself in designing superb lanterns and torch-holders.

Spain also produced about the same period much beautiful ironwork in the shape of moulded rails or balusters and friezes of pierced and repoussé work, the whole being often plated with silver. The use of metal for pulpits is probably confined to Spain. These are sometimes of bronze, but also of wrought-iron, as in a church at Zamora, and in that of San Gil, at Burgos. Screens were also produced in England of considerable excellence, examples of which are those erected to Bishop West's chapel at Ely, and to Edward IV.'s tomb at Windsor, both made towards the close of the fifteenth century. Iron tracery-work, produced by cutting out patterns in plate and placing one plate over the other, gave richness of effect by means of the play of shadow, and was employed in the construction of the screen to Henry V.'s tomb at Westminster.

Some grill-work also exists in the cathedrals of Canterbury, Winchester, and Chichester. Grills were much produced in France, where ironwork attained to a high degree of excellence. When Charles V. ordered his library to be removed from the Cité, the windows of the Tower of the

Fauconnerie were ornamented with grills 'to keep it from birds and other beasts'. They were used for windows over doors, for balconies, and even for chimneys. It was the expense of the elaborate 'grilles' at Versailles which led to the disgrace of Colbert. The grills to the churches of St-Roch and St-Germain l'Auxerrois furnish matter for much commendation to the newspapers of the time. The grills made for the Palais de Justice in Paris cost as much as two hundred thousand livres. Amateurs took as much interest in these products of the forge as in paintings or bronzes; so much so, that a locksmith named Gérard, who had executed an iron canopy in 1769, put it on view for three days, charging those who would inspect it three livres apiece. This canopy was originally intended for the church of Sainte-Geneviève; but the price asked—fifty thousand livres—proving too much, it was never erected there.

The art of the locksmith was also greatly appreciated in France, kings even taking part in its practical details; like Louis XVI. forgetting for a time the cares of state in the construction of a lock. One of the curiosities of Paris mentioned by Gilbert of Metz in 1422 was a certain house in the Rue Bourdonnais which possessed as many locks as there are days in the year. The lock to a coffer of fifteenth-century work has a representation of the Last Judgment. Philibert de Lorme paid in 1559 to the master locksmith, one Mathurin Bon, as much as six thousand and eleven livres for works executed at Fontainebleau. Louis XIII. amused himself with the art, not only giving his locksmith a pension of three hundred livres, but even setting him apart a room in the new château of St-Germain. In the eighteenth century much fine work was produced. Mercier, in his *Picture of Paris*, exclaims: 'A locksmith among us has become an artist—iron has become as supple as wood.'

Germany in the fifteenth century produced much wrought-iron work of a rather special character, such as the grave-crosses and sepulchral monuments to be seen in the cemeteries of Nuremberg. Iron was also employed for well-canopies, such as that at Antwerp attributed to Quentin Matsys. Originally a blacksmith from Louvain, he came to Antwerp to seek his fortune. There, as the story goes, he fell in love with the daughter of a painter, and, to propitiate the daughter as well as her father, exchanged the anvil for the painter's palette; and before his death in 1531 he was successful in helping to raise the school of Antwerp to a celebrity equal to that of the schools of Bruges and Ghent.

Ironwork was extensively produced at Augsburg—under the fostering care of the Fugger family—taking the shape of brackets projecting from the walls, and grills over fan-lights or in a balcony. Grotesque knockers are also common in Nuremberg. Keys were sometimes elaborately decorated, and the part which is now a common ring was once occupied by little figures in full relief with coats of arms and the like. The French Revolution was the cause of much splendid ironwork being destroyed, when, in 1793, certain provinces had to gather together every available piece of iron to transform into pikes and other weapons. Much of the ironwork of

the Abbey of St-Denis perished in this way; and even in England grills have been sold for old iron because they hid the sculptures in Westminster Abbey.

The greater part of the decoration of grills at the present day is produced by means of stamps or moulds, which are impressed on the iron whilst heated and soft. Supposing a leaf or flower is required, one of the proper form is forged in relief in steel, and then is driven into a larger block of pasty steel shaped like a punch or wedge, thus forming the stamp or die necessary for the purposes of decoration. Leaves, again, can be hammered out and welded on separately. Up to the reign of Henry VIII., grills were architectural in design, Queen Elizabeth's tomb in the Abbey forming one of the first instances of the use of a border of natural flowers—roses—in a tomb-rail of iron. The roses were cut out of sheets of metal, shaped on the edge of some instrument like a vice, and then fixed on by brazing. To make inscriptions, holes are first drilled, and then a very small keyhole saw inserted. After the Fire of London, iron came largely into use for building purposes, and very fine work was produced in the reign of William III. A Frenchman named Tijon published a book of designs in 1693 for the use of smiths, in which appeared the gates which were a little later ordered by the king for Hampton Court, and executed by Huntingdon Shaw, the talented smith, under the general superintendence of Sir Christopher Wren. The beautiful gates of chiselled and polished iron now to be seen in the Louvre are of this period, and were executed from the designs of Daniel Marot, who was architect to William III. of England. Wherever the old-fashioned red brick houses with their tiled roofs and quaint dormer windows are to be seen, there iron staircases, railings, and the like will probably be found, as, for instance, in Lincoln's Inn Fields or Bloomsbury Square and in many suburbs.

Cast-iron is not so susceptible of artistic treatment as the same material when hammered, and the old specimens which have come down to us are, generally speaking, more curious than beautiful. Cast-iron was used for cannon—from the fourteenth century—as well as for grave-slabs, fire-dogs or andirons, firebacks, and the like. One fireback preserved at Bruges is dated 1565, and has two figures three feet six inches in height as supporters to the shield with which it is ornamented. A fireback at Wadhurst, in Sussex, was very elaborate, having, beside the royal arms of France and England quarterly with supporters, the Tudor badge of rose and crown, a crowned shield and ten human figures with monkey or dog-like faces, as well as a couple of swords. Many firebacks have scriptural or classical subjects; but one andiron that has been preserved to us is decorated in a more homely fashion, having on its upper portion a figure in the costume of the time of James I., holding a tobacco pipe in the right hand, and in the left a jug or tankard—the first of which decorations would by no means have pleased the royal author of the *Counterblast*.

Such are some of the various ways in which iron has been treated decoratively from early times, which perhaps may prove not uninteresting

at the present day, which largely into the ornament for grills, fanlights, balustrades, and screens, or for the pretty lamp stands and brackets, in which a return has been made to the early Italian workmanship.

en wrought-iron enters so in the decoration of houses, whether in the form of balustrades, and screens, or for the pretty lamp stands and brackets, in which a return has been made to the early Italian workmanship.

URGENT PRIVATE AFFAIRS.

CHAPTER III.—OPENING THE DRAWING-ROOM OF GARWOOD HOUSE.

'DREAM or fact?—dream or fact?—dream or fact?' thought Nellie Morton, as she lay on the bed of her own room after Mrs Bathurst had left her. Had she heard this man say he was hopelessly ruined? Had she dreamed that the old woman indicated that she, Ellen Morton, could save him? If she had not dreamed, what could the words and gestures of Mrs Bathurst mean? Only one thing—only that this monstrous creature should come by whatever money her father had saved. How was that to be done? Only in one way—by this awful, this monstrous man marrying her!

What a horrible, what an intolerable position was hers! Colonel Pickering had bidden her good-bye, and she had no address for him between the leave-taking and Gibraltar. In all the world she did not know a soul on whom she could rely for help or advice. She thought of her old school, but that was in Yorkshire. Most of her acquaintances in Deighton were connected with the regiment, and on the move with the Colonel. She had never gone a journey by herself, and she felt like a lost wanderer in a desert, or the sole human being on an island where beasts of prey lurked in every shelter.

She was alone in Garwood, alone in London, alone in England, alone in Europe! There was no one to whom she could appeal. She was imprisoned within the high walls of these lonely grounds. She was certain it would be worse than useless to ask assistance of any servant in the house. The old woman who had opened the lodge-gate would, she knew, refuse to let her out. Even if she succeeded in gaining the public road, what could she do there? She could not wander about day and night. She had only a little money in her pocket, and even if she had ten times as much, what could she do with it? She never in all her life had bought food or been across the threshold of an hotel. But what was the use of thinking about liberty? From the grounds of Garwood House she could no more escape than flee to her father in remote Brazil.

Mrs Bathurst had chilled her, had sent the blood back into her heart, until she felt suffocating, until she awoke to shadowy terrors threatening her in distances and silences and spaces of that oppressive house. In any other house the nooks and corners had been no more full of fears than on esplanade or terrace or country lane. Here nooks and corners were the hiding-places from which ghosts fled on one's approach. Here the vast spaces over the stairways were the haunts of shrouded mystery and boding echo.

Mrs Bathurst had chilled her: William Bathurst had made her blood freeze with terror. The hideousness of his appearance stunned her,

and at sound of his monstrous voice and sight of his revolting capers, she had swooned. And then to think—if she could trust her numbed senses—this old woman had indicated that this hideous man was to be her suitor! She who had never heard word of love from man was by a vile conspiracy to be forced into the arms of this loathsome creature, in order that his ruined fortunes might be made whole with her father's money! Surely no one in England could to-day contemplate so odious a crime! She would die, ay, die a thousand deaths of agony before yielding to so hateful a fate.

Could it be that she gathered the real import of what had gone on while she sat half-conscious?

There was no room for doubt. Had not the old woman begun with a reception chillier than December? Had she not told her this William Bathurst would never marry? And then, after learning that her son had lost his money, had she not spoken in terms of affection, nay, of endearment, to the girl, whose presence seemed a burden and an injury an hour before? What more confirmation was needed?

She was the centre of a vile plot, encompassed by inviolate walls, alone, helpless, friendless! Oh, would not merciful death come to deliver her!

Inviolable wall? The grounds were not closed in on all sides by walls—at the foot of the grounds flowed the river!

Nellie rose from the bed. She was deadly pale. She caught up the hat worn that day in the grounds, and stole out of the room, out of the house, and, following the dip of the land, took her way towards the Thames.

When William Bathurst had left the house at the bidding of his mother, the old woman rang the bell and ordered the luncheon things to be taken away. She then crossed the great hall into the large gloomy drawing-room. At ordinary times, months went by without a visit from either herself or her son to this great chamber. The blinds were always kept down, and in spite of the blazing unclouded June sun, only a dim twilight filled the place.

She drew up the blinds. That was her first act towards changing the aspect of the house, as an indication that all within had changed. Up to this day she had her mind made up her son would never marry. This day she made up her mind William should take a wife. She raised the blinds as the first act of preparing the house for her son's marriage.

She had been the inspirer of her husband's speculations in the City, and he left all he died worth to her. This was not the house where her husband died. He bought it a short time before his death, but had never lived in it. The widow let it until her son began to be troubled with those alarming hysterical seizures; then, it being quiet, retired, surrounded by high walls and large grounds, out of the way, and well qualified to keep a secret, she went to live in it herself, taking her son with her.

When mother and son moved into Garwood House, the place was furnished for ordinary family use. Mrs Bathurst had not then decided William should never marry. But as years went on, the air of retirement deepened around the

house, the isolation of its inmates became more strict, until from year's end to year's end no stranger entered its gates.

The raising of the drawing-room window blinds to-day was to let in the dawn of a new era. William had lost all his money, and all her money as well, in those villainous South American speculations. But the very same day that news of the disaster reached London, this girl, Ellen Morton, strayed under their roof with a fortune large enough to save William. Nay, more, the finger of fate pointed indubitably to the match; for, out of the South America which had engulfed William's money, the money of this girl had been rendered into their hands, and the very day which brought ruin to the City from the south brought news from the south of the death of the girl's father, and the departure of the girl's only friends from England, thus leaving this Ellen Morton with her fortune completely in their power.

The old woman knew all her son's affairs save those connected with the speculations she had discountenanced. 'Once you go south of the equator I abandon you,' she had said to him long ago when he first broke loose from her counsel. 'You are not to mention to me any of your affairs in that region of thieves and revolutions. All I will ever hear of South America is that Christopher Morton's money comes safely out of it, and does not go back there to be lost.'

She knew that by this time the amount of Christopher Morton's investments must be thirty or forty thousand pounds. This was not a large fortune, but it ought to be enough to give her son time to recover himself; and she was quite sure William would never again disregard her advice, and that, with the aid of this girl's fortune and her advice, her son would once more be able to hold up his head as a member of the Stock Exchange.

She knew that in the will lodged with Christopher Morton's lawyer the dead engineer had left all his money to his daughter, and appointed her son and Colonel Pickering guardians and trustees. The father now was dead; and the other guardian and trustee would be out of England before morning, and would not be back again until this girl was of age—until she was married.

Mrs Bathurst rang the drawing-room bell, which had not sounded for no one knew how long.

'Let this room be thoroughly done out to-morrow,' she said to the servant; 'and for the future, when the sun is off this side of the house, let the blinds be pulled up.'

While Mrs Bathurst was taking a first step in arrangements for her son's future, that son was hastening back to London to stop disaster in the present. Having once made up his mind to use Christopher Morton's money for his extrication, there was no difficulty in the way, though there was possible danger of the direst kind.

Christopher Morton being dead, and Colonel Pickering as good as out of the country, it was necessary only to produce the signature of the dead man on a certain document, so as to enable William Bathurst to raise money that very evening. There was no need to tell any one in the City that Christopher Morton was dead. In fact, it would cause fatal delay if the news in the

telegram from Brazil got abroad. The message had been forwarded from his office unopened, so he was safe from premature disclosure.

Bathurst had no moral scruple about creating the document he required. It was dangerous work: dangerous work this fabricating of signatures, even of a dead man; and dangerous this concealing of the dead man's death, and dealing with his property as though the signature were genuine and the supposed signatory alive. Bathurst did not in his mind use the word fraud or felony, but he was not blind to the gravity of the act he contemplated.

Morton was dead, the girl was under his roof, the other trustee on his way to India; months of undisturbed possession of the money could be counted on—even if the girl did not become his wife—and in months all could be put right. Even the girl did not know of her father's death, and was not to know of it until there had been time for a letter to come from Brazil.

Truly, as his mother said, fate had played into his hands! If he had been allowed to design the situation, nothing could have been better ordered. Luck! Yes; he believed in luck. He had always been lucky until he touched South America, and the very moment South America proved a ravenous quicksand under his feet, from that self-same South America a hand of succour was stretched forth to him!

A hand of succour stretched forth to him?—or was he stretching forth his hand to rifle the tomb of a friend? Bah! Such thoughts were childish, and could not be of use to a keen man in the City this day of hideous disaster!

He had told his clerks in Langley Court, Fenchurch Street, that he was going to Garwood. He had not said anything about coming back. They did not know whether they should see him again that day or not. When he walked in at five o'clock they were not surprised. That day no one was surprised by anything done in the City.

William Bathurst went straight into his private office and locked the door. In a quarter of an hour he emerged, pale and anxious, and hurried out. That day the banks shut their doors at four as usual, but private offices forgot custom and were open long after closing-time.

In less than half an hour, Bathurst was back, had saved his house, had borrowed money on a signature which was not genuine, and on the faith that Christopher Morton was alive.

Once more he turned his face towards home. In the hurry and excitement of his operations in the City the necessity for doing speedily what he was about prevented thinking. In the cab which took him to the train and in the train that carried him away from town he had plenty of time for reflection.

'Saved!' he thought, as he jumped into the cab. 'Saved!' he thought again as he flung himself into the cushioned corner of the railway carriage. Saved from imminent and complete ruin! How easy it had been! What a trifling effort it cost him to place a secure barrier between his house and destruction! To-morrow, the names of all the houses sucked down in the whirlpool would be known in the City, would be known throughout all the commercial world; and but for the thing he had just done, the

house of William Bathurst would be in that black list!

Favoured by circumstances, and aided by his mother's advice and his own bold vigorous action, he had been able to save himself from bankruptcy—from being posted as a defaulter—he, posted! who had for years held his head so high, and been regarded as a rock of good sense, as a slow-going, money-making speculator! He had kept his dealings in South America to himself. No one need now know that he had burnt his fingers, to say nothing of escaping annihilation in the fire.

True, he had been obliged to run risks; but were the risks worth taking into count? Supposing the worst, were the risks very great? No. For, even if Colonel Pickering were not going abroad, he would be friendly and allow his fellow-trustee to do pretty much as he liked; for the Colonel, no doubt, knew that the dead man had placed unlimited faith in William Bathurst.

When his mother suggested his using this money, she did not take into count the risk he would run. No doubt she had no suspicions there was any risk beyond that of using another man's money without his authority or knowledge. In the hurry and confusion, her notion most likely was that he could get Morton's money as readily as the money standing to his own credit in his own bank. There would be no need to undeceive her. Or, indeed, it might be that she knew exactly what he had been obliged to do.

What! She, his mother, *knew* that he was at that moment a felon! Monstrous! His mother know *he* was a felon! His mother approve—nay, suggest that he should commit a crime!—commit two crimes! Intolerably monstrous! Masculine as her mind was, still first of all she was his mother, and no man ever yet could believe that his own mother would urge him to crime! Ugh! he would think no more of this ghastly side of the affair. He would dwell altogether on the fact that he had been threatened with destruction and had saved himself.

He reached the door of Garwood in profound cogitation. He had resolved to take his attention away from unpleasant aspects of the affair, and yet no sooner did he for a moment forget this resolution, than, like a spring at the release, his mind flew back to the question: Did his mother know what following her advice involved, a crime on his part?

'Where is Mrs Bathurst?' he asked of the servant who opened the door.

'In the drawing-room, sir.'

'In the drawing-room!' cried he, awaking out of his reverie. 'Did you say in the drawing-room?' he asked in astonished incredulity. During all their years in this house she had never awaited him in the drawing-room before.

'Yes, sir; the mistress ordered dinner to be put back, and said that when you came you were to be good enough to go to the drawing-room, where she is alone.'

He hastened across the hall, and entered the room which he had not seen for—months—years. His mother was sitting in the arm of an old-fashioned sofa at one of the windows. She motioned him to shut the door and come near her.

'You are surprised to find me here. I have drawn up the blinds in honour of Miss Morton—

in honour of your future wife. Sit down here.' She pointed to the other end of the sofa. 'How did you get on in the City? Did you arrange everything satisfactorily?'

'Yes. There was no hitch.' He sat down at the other end of the sofa.

'I am glad of that. I am greatly pleased you acted so promptly. You have taken all means to ensure safety?'

'Oh yes, all the means.'

'And there is no going back upon what you have done? Even suppose you thought of changing your mind now, you could not go back?'

'No. I have drawn Morton's money, and the proceeds have been paid away against my undischarged liabilities of to-day.' What could she mean by asking could he go back? It seemed clear from this that his most horrible suspicion was true. It was now plain she must know he could not have extricated himself without crime. This was terrible.

'I am glad to hear you cannot go back, that you are now obliged to go on towards prosperity once more. Something has occurred since which made me for a moment fear you might be able to go back upon what we this morning resolved to do.'

'And you think if I could I would? What is it that has happened?' The cold sweat broke out on his forehead. That morning he had been distracted, driven frantic, made half mad by the things that had occurred in the City. Never in his life had he felt fear until now. He felt cold with fear, clammy with fear, sick with fear.

'An unexpected event has occurred here since you left.'

'What is it?' He was not sure that his voice uttered the question.

'Colonel Pickering came back.'

'Why?'

'He found a telegram for him announcing Morton's death, when he got to town. We never thought of that. We never thought Morton would have said that Colonel Pickering, also, must be telegraphed to if he died.'

'No; we never thought of that. Telegrams from Brazil are so dear, I fancied one would be enough.'

'Yes; we never could have been prepared for this. Does it make much difference?'

'Perhaps. I do not know; I cannot say yet. What has taken place here?' He groaned and wiped the cold sweat from his forehead.

'He came, not thinking we had word of Morton's death. I did not tell him we had a telegram.'

'Thank Heaven for that!'

'He said he got the cable, and ran out to break the news to Miss Morton. I sent a servant for her. She was not in her room. The servant supposed she had gone into the grounds, as her hat had disappeared. Colonel Pickering said he would go out to look for her.' She pointed to the window. 'He had only just left me when you knocked. Does it make much difference?'

'I thought this man was leaving London to-day?'

'He says if he can get away by a train near eleven to-night he can catch the ship.—I asked you, does it make much difference, and you have not answered me. I ask you again, Does it make much difference?'

'It may.' Again he groaned and wiped his forehead.

The piercing, dark, inscrutable eyes of the woman were fixed inexorably on his face. 'Much?' she asked. 'Very much?'

'It may.' He loosed his collar at the neck and stared. His face was ghastly, his jaw dropped.

For a minute silence was unbroken; each sat regarding the other. In that brief interval he knew that she must know all. In that brief interval he knew more than associating with her a lifetime had taught him. In that brief interval the heart of each was revealed to the other more plainly than ever words could tell. In that brief interval he knew she valued as dross the wealth he had believed she worshipped for itself; and that for her heart, he, and he alone, the ugly duckling, the Crocodile, was the only gold she saw or worshipped. In that brief interval he knew she had devoted all her life to him, because she had come to the conclusion no other woman would ever love him. In that brief interval he fathomed her plan of concentrating all his mind on getting money in order that he might have a pursuit which would not stale with time—a pursuit that would grow in interest and become more ardent and absorbing with time—a pursuit which successfully followed would make him powerful and respected in spite of his grotesque figure and his odious face. In that brief interval the son saw through the mystic robe of the sibyl deep in the bosom of the woman, the heart of the mother blazing with the intolerable glory of its unselfish love.

Blinded and awed, like Moses by the fiery bush, he was mute.

'If it is too much,' she said, 'you will try to remember I am a mother, and all I did I did for love, and it is hard for a mother to help loving too much.'

He held out his hand to her, but could not speak.

She caught his hand, and sinking upon her knees, raised it to her lips in a transport of gratitude, crying to herself: 'He will forgive me! He forgives me even now!'

At that moment Bathurst saw a man running towards the house with something in his hand. He raised his mother hastily and flung open the door into the grounds.

The man shouted: 'I cannot find Miss Morton. She is not in the grounds. I found this, her hat, on the bank. The hat is torn, and there are signs that some one has fallen into the river.'

MEDALS AND MEDAL-COLLECTING.

MOST persons—even if without any claim to shine in what is known as 'numismatology'—take an interest in commemorative medals, and sometimes envy those who have earned a right to wear such popular tokens of distinction. Collecting war medals as an amusement is of comparatively recent date. Before the reign of Queen Victoria, a soldier or sailor who wore a decoration was an individual who commanded special notice. With the exception of Waterloo veterans, who were always conspicuous when wearing their much coveted medal, the rest of the army was undecorated. The study of the subject, which has of late years sprung into existence, has had

the effect of unearthing many curious old decorations, and bringing to light some that ran a great risk of being lost in oblivion or consigned to the melting-pot. The best known pioneer in this now favourite pursuit is Mr J. Harris Gibson, to whom all collectors are indebted for a useful little book on Medals, published in 1886. A still more important contribution to the literature of the subject is the handsome volume now prepared, on behalf of Messrs Spink, by Captain Tancred, of the Scots Greys, a well-known authority, who has, by special permission, dedicated his work to Her Majesty. The three largest private collections in this country are those of Colonel Murray of Polmaise; Colonel the Hon. H. F. Eaton, Grenadier Guards; and Captain Whitaker, 5th Fusiliers. Captain Tancred confesses, with scarcely concealed regret, that England has not been so zealous in commemorating the memory of great naval and military deeds as some other nations. The Romans were prodigal in conferring honorary distinctions for heroic achievements, and although no pecuniary value was attached to them, yet the recipients of these distinctions were regarded with peculiar favour.

English medals, as decorative rewards for bravery in the field or at sea, are comparatively modern. Tradition points to Edward III. as the founder of the Order of the Garter, intended, as Elias Ashmole tells us, as a restoration of King Arthur's Round Table. Unfortunately, however, the royal statutes defining and regulating the position and conduct of the noble fraternity have perished, and their places have been supplied by fabulous stories. It was in the time of Henry VIII. that the ordinances of this renowned Order assumed their present characteristics, and from that period an authentic history exists regarding it. There is much obscurity in the notices of what apparently are honorary badges struck in the reigns of Elizabeth and James I. There is little doubt, however, that some of these were worn as decorations. In many instances they have loops or apertures for attaching them to the coat; but as there is little to show for what special purpose the medals were made, their interest and value are necessarily curtailed.

The magnificent star and jewel given by Queen Elizabeth to Sir Francis Drake, on his return from his memorable voyage round the world, is one of the few decorations of this early date that can be verified. It is preserved amongst other mementoes of the great circumnavigator at the old family residence of the Drakes, Nutwell Court, Devon. The star is in the form of a sun, and has rubies set in the rays, with opals and diamonds interspersed in the border around the inner portion; an orb is engraved in intaglio, emblematical of sovereignty. The badge or jewel is richly enamelled in red, yellow, blue, and green; and in the border are set diamonds and rubies. A splendid cameo, cut in onyx, occupies the centre, believed to have been executed by the celebrated Valerio Vincenteno. The representation of two heads is the subject of this cameo. One is what might be termed a classical head with regular features, typical of Europe; the other has the features of a negro, and is intended to represent the black races of the world. At the back is an exquisite miniature of Elizabeth. The same queen offered a gold medal and chain to the

superior officers after the defeat of the Armada; but if she had laid out her money with more judgment, she might have recompensed all the crews in less precious metal. Charles I. gave decorations for valour by fits and starts. An interesting medal is still in existence said to have been presented by him on the scaffold to Bishop Juxon. The happy innovation of perfect regularity of distribution was introduced by Cromwell after Dunbar, but this example was not followed by his immediate successors. It was not until Waterloo, one hundred and sixty-five years afterwards, that a similar distribution took place. It was not until long after most of the veterans of the Peninsular War had gone to their graves that a tardy national gratitude thought of commemorating their achievements in imperishable bronze.

At times the scandal of official neglect led to attempts to supply the lack of national recognition by private liberality. Private persons were permitted to offer medals at their own expense to the heroes of some of our most famous actions. There was actually a private medal for the Nile and another for Trafalgar itself. In the latter case, Mr Boulton, the partner of James Watt, was authorised, with the king's 'warmest approbation of so laudable a design,' to provide a silver medal for the officers and a pewter one for the men; but the valorous tars did not appreciate it, and most of them almost immediately threw overboard the pewter medals, which they thought insulting as a reward after so severe a battle. In the case of the battle of the Nile, the medal was presented by Mr Davison, a personal friend of Lord Nelson. William III. and Mary recompensed bravery even in defeat. After the engagement off Bantry Bay, in which the French successfully repulsed the English, Admiral Herbert was created a peer, and two captains were knighted, while every seaman received a gratuity of ten shillings. After Russell's victory at La Hogue, the government voted £30,000 to be divided amongst the seamen, and gold medals were presented to the senior officers. It is worthy of record that at this period heroes in humble life also met with due recognition, as in several instances fishermen received gold medals and chains as a reward for gallant deeds. Queen Anne, as a mark of her favour and approbation, granted to the principal officers of Admiral Dilke's squadron large gold medals to commemorate their intrepid conduct in the destruction of a large fleet of merchant vessels, together with a numerous and well-appointed convoy.

George II. conferred medals and chains on officers who greatly distinguished themselves. In his reign, medals were struck and presented to commanders who were present at the battle of Culloden. Some of these are still preserved in families and treasured as heirlooms. During the long wars between England and France in the reign of George III., not only did private individuals, as already noted, give medals at their own expense, but commanding officers on certain occasions also conferred them. This was the case at the close of the ever-memorable defence of Gibraltar, when General Eliott, afterwards Lord Heathfield, who commanded the garrison during that eventful siege, caused medals to be struck at his own expense in gold and silver, which were presented to every officer and soldier of the Hano-

verian brigade who formed part of the garrison. This medal bears on the reverse the word 'Furnace,' with an engraving of a sort of kitchen range, and below this the words, 'Spaniards defeated by red-hot shot at Gibraltar, September y^e 13th, 1782.' To George IV. we owe the Waterloo medal and its liberal distribution. The peaceful reign of William IV. afforded no occasion for the giving of war medals, but the well-behaved soldier in quarters was not forgotten. The long-service and good-conduct medal for both army and navy was instituted by this monarch; and thenceforth private orders of merit and good conduct were practically done away with, the old maxim being restored and enforced that the throne is the fountain of honour. During the reign of our present Queen acts of gallantry have been rewarded with numerous decorations; nor was Her Majesty unmindful of those veterans who had served their country for years long previous to her accession. In 1847 a general order was issued that the survivors of the wars from 1793 to 1814 should be distinguished by the grant of a medal, with clasps representative of the different actions in which they had been engaged.

English medals have always had more interest from their bearing on events than as works of art; but in recent years their style has improved as their purposes have extended. No longer confined to commemorate great naval and military deeds, they are used to signalise the most varied occasions, from a royal jubilee to victories in the spheres of sport, science, or scholastic achievement. But as in our own time these rewards are given, for instance, by the Royal Humane Society to celebrate individual heroism in the saving of life, so in former days they were sometimes, though rarely, given as an incentive to peace as well as by way of reward in war. Thus, during the French war, provoked by encroachments on our North American colonies, the Society of Friends in Philadelphia formed themselves into an Association for the purpose of encouraging peace with the Indian tribes. Silver medals were struck in 1757, and presented to Indians by the Association. These showed on the obverse side a laureated bust of George II.; on the reverse, a white man and an Indian seated beneath a tree at opposite sides of a fire; the calumet of peace is passing between them, and the sun is shining above. Although not artistic, for the representation of the sun is like a full-blown chrysanthemum, this medal is of much value, being exceedingly rare. During the American War of Independence it was considered politic for England to be on terms of friendship with the North American Indians. Large and handsome medals were therefore struck for presentation to the chiefs or great men of the tribes who had rendered good service to George III. On the obverse side this medal shows a bust of the king in armour and with laurel wreath; the reverse side represents an American Indian and a white man sitting together under a tree; the Indian in the act of presenting his pipe to his companion in token of peace and friendship. In the background are Indian wigwams, and above is the legend, 'Happy while United.' The loop for suspension is significant, being an eagle's wing and the calumet of peace placed crosswise. Many years afterwards

Mr Catlin found an Indian chief who was still wearing this medal, and who was particularly proud of the fact that he had kept the king's face bright by wearing it next his skin.

AN UNLOOKED-FOR TURN.

CHAPTER II.—CONCLUSION.

BIRD went straight out, as he said this, leaving the master of the house terribly angry, yet with a strange startled feeling which he would hardly permit himself to acknowledge—a foreboding that he had not seen or heard the last of this man or his claim.

'He has left his papers, has he?' he exclaimed. 'I will throw them into the fire, to begin with.' But although he spoke thus, he knew in his secret heart, even as he stretched out his hand for the papers, that he should not deal with them in any such fashion; nor did he. He read them through, and as he laid each one down, uttered some ejaculation of contempt; but he was unusually abstracted and nervous when he sat down to supper with his wife, to whose questions he merely replied that he had a bad headache.

His solicitors, Messrs Hinger and Barkman, were surprised by a call from Mr Dudley Starbert-Smithers on the next morning as soon as their office was open. He entered on his business with a laugh half contemptuous, half apologetic, for troubling them in such a matter. Throwing down the papers left with him by Mr Silas Bird, he said: 'Give this fellow such a rap on the knuckles as will teach him better manners,' closing his speech with another laugh, intended to be scornful, but which perhaps had in it an unsound ring, for old Mr Hinger looked curiously at his client over the rim of his gold spectacles.

The lawyer glanced through the papers, and promised to attend to them at once. 'They would be very serious, if genuine originals could be furnished,' he said; 'but the man is probably doing this to avenge himself by a malicious hoax for the part he must know you took in the prosecution.'

After further conversation, in which Mr Dudley may have shown more anxiety than he intended, he rode off; and Mr Hinger, the papers still in his hand, sought his partner, Mr Barkman, with a face expressive of anything but cheerfulness.

What steps these gentlemen would have taken, it is difficult to say; but fresh events decided for them. Their client rode over again in the afternoon, bringing with him a letter he had just received—a formidable legal affair, from an attorney of low standing, but of great repute for his sharpness; and this was actually the preliminary to a lawsuit. Stated plainly, Silas Bird declared that he was a near relative of Mrs Edwy Starbert—he claimed, indeed, that she was his daughter—and had stood as godfather when her son was christened. That this child being puny and sickly, Mrs Edwy had never cared for it, and so had given Silas Bird twenty pounds to take charge of it for good and all. That he, Bird, had done so, and went away from London before the death of Edwy, of which event he had heard; but he had not known of the death of the senior Mr Starbert, nor of his accession to an

estate, nor of his change of name, so had not known the position the child was entitled to assume. During the late prosecution, he had learnt all these things, and on behalf of the child, he, as the guardian, the mother having since died, claimed its rights. To avoid litigation, he would accept half the Starbert and Smithers property, if an agreement were arrived at without going into court. He furnished a number of references, certificates and the like, into which Messrs Hinger and Barkman were to inquire. In connection with these documents the firm engaged two first-rate detectives; and in connection with them, it may also be said, the firm had the most serious misgivings.

Every step taken, every additional scrap of information obtained, made Mr Dudley's case look less hopeful. It was shown beyond all doubt that a son had been born to Edwy of his marriage, and what was of almost more importance, it was proved that the child had been given to a man who was conclusively identified as this very Silas Bird. The woman married by poor Edwy was certainly Caroline Bird; so this part of the story also was confirmed. All this was absolutely beyond dispute; and it was therefore no wonder that Hinger and Barkman, while putting the best face on the matter possible, counselled the buying off of Mr Bird, if only, as they phrased it, for the sake of peace and quietness.

This counsel was naturally unpalatable to Mr Dudley, and he tried to carry matters with a high hand; but this bravado was only on the surface. The legal proceedings had been fairly commenced, and the 'Remarkable Discovery of a Lost Heir' had already furnished paragraphs to the local papers. Dudley strove to meet all inquiries with a laugh, professing to see only absurdity and swindling in the whole transaction; but when at home, he was dreadfully dispirited, and showed that he feared the worst. He felt that he could have challenged the result with more courage, but for the birth of his son, the heir to his estates, who was to have such a distinguished career, a career his father had pictured a thousand times over. How bitterly Dudley regretted that he had not decided upon a plan which had been much in his mind when he left Churchborough—to sell the whole of his property and go to America. Had he done this, he could have laughed at the claim which now looked so dangerous.

The hostile solicitor had made one or two overtures for a compromise; but Hinger and Barkman had no authority to negotiate, and so these fell through. The firm still advised their client to effect some arrangement; but he obstinately preserved his swaggering defiance, or attempted to do so, until all at once he collapsed. By this time the suit had progressed so far that the action was entered for trial at the county court. The final reports of the detectives had been received, and these were hopelessly against Mr Dudley's interest, every shred of doubt as to Bird's having been entrusted with Edwy's child being removed; and then, as intimated, Dudley collapsed. As all such men would do, he went into the other extreme, and gave his solicitors carte blanche to settle the suit upon any terms, even though he had to divide the estate, as

Mr Bird had suggested in his friendly call at Dudley's house; but the day was now gone by. Mr Bird's lawyer was now too confident to abate the smallest portion of the claim, and took, no doubt, a keen professional pleasure in loftily repelling the advances of Hinger and Barkman, who had always held aloof from and assumed to look down upon their present antagonist.

War to the knife, then, was all that was left to him, and Dudley became at once a depressed and broken-spirited man. He rarely stirred out of his own house, where he would sit for hours alone with his infant son, who was just beginning to prattle, and the father's brow grew gloomier day by day. It was dreadful to think that this bright child, who had done so much to relieve and redeem his father's life, who had been regarded as the heir to such fair estates, and whose future was scarcely ever out of Dudley Starbert's mind—no, not for a single hour since his birth—that he should be disinherited, should be a comparative outcast, should be ousted to make room for such a successor.

Rumours of great festivities in the house to which Mr Silas Bird had removed were now afloat, and much was said of the strange company he entertained. His chief friend and adviser appeared to be the head-clerk of the lawyer who supported his claim, and this clerk was a man of anything but a good character. His employer was by no means of high standing, and had probably never been engaged in so important or respectable a matter before; but the clerk was reported to have been more than once an inmate of a jail. However, this signified little to Dudley, who saw his ruin impending, the catastrophe drawing closer day by day. Even his own lawyer hardly pretended to have much hope now, and so it was immaterial who or what was the agent of his downfall. It became a very serious question as to whether he should go to trial at all; his decision was pressed for, as the time had come when counsel must be engaged; and as Sir Homer Vickers, the Solicitor-general, and Mr Julius Lance, the eminent Q.C., were the barristers proposed, the outlay, especially if for a certain loss, would be alarming. The brooding, morose Dudley was scarcely ever seen out of his own house, while each day the hopelessness of his position became more evident.

He was seated in his study one evening, listening to the wind and rain against the windows, drooping forward as he sat at his table, and trying to think rather than thinking. He had something to think of, for he had just concluded an interview with Mr Barkman, who had candidly told him that if Mr Silas Bird could only establish in court the exact facts which his, Barkman's, own agents had advised him were indisputable, no talent on Dudley's side could avail him a tittle; and indeed, the briefer and less stubbornly the battle was fought, the better for him. In any case, the next day must settle the engagement of the eminent counsel, and Mr Smithers—Dudley never meant to call himself Smithers after the trial—must give a cheque for six hundred guineas, this being the lowest amount for which their services could be secured. His mood was despondent, and he felt an almost irresistible inclination to abandon the struggle, gather together all that was left of his own—of

his boy's property, he thought—and go clear away. He had heard of great successes in Australia by those who could raise as much capital as he could still command, and surely that would be better—

A ring at the door-bell was heard. What other visitors could be coming on such a night? It was the morbid irritation of his nerves of course which produced the feeling; but he seemed to know, as of a certainty, that this peal was connected with the business which was haunting and almost maddening him. The servant appeared, and asked if he would see a lady who declined to give her name, but said she had called upon urgent business. Any affair should be urgent, indeed, which would bring a woman on foot, as it seemed she was, through the falling torrents; so she was shown in. She was of course wrapped up; but she laid aside her hood and shawl, and as she seated herself, Dudley saw that she was a young woman; but her face was haggard, harshly lined, and darker than is often seen in England. The gentleman fancied he had some dim remembrance of this face, but could by no means recall where he had seen it. He began a question, asking as to what his visitor wished to see him upon; but she interrupted him.

'I can see you do not recollect me,' she began.

He started, for he knew the voice at once—knew the speaker, and a wild, half-desperate hope sprang up in his mind instantly.

'You knew me as Caroline Starbert,' she resumed, 'the wife and widow of your brother Edwy. I am now the widow of Thomas Meadows of the royal artillery. I have been reported as dead myself, and have indeed gone through trouble enough to kill most women; but as you see, I am here alive and strong, although a good deal scorched by the Bengal sun. I am here to tell you something of interest. You were unkind to me in my distress, when I had not been a week a widow. It was by your influence I was left almost penniless, to do the best I could in the world.'

'I assure you that—that I did not—could not,' began Dudley. He was unable to frame his excuse without faltering, for the woman spoke the truth.

She saved him some embarrassment by interrupting him. 'So you see,' she said, 'it is not from gratitude I come to you. However, you did not afterwards know that I had a feeble, crippled boy to support.'

'I swear I did not!' exclaimed Dudley; 'I sincerely wish I had known it.'

'Well, in this boy's name—mark what I say,' continued the woman—'in his name, Silas Bird, a relative of my family, but a disgrace to it, claims your estates. My coming home is annoying to him of course; he had given out that I was dead, and perhaps he really believed it. In any case, I was to know nothing about his plans till after his success, when he would not have cared for all I could do. I am—or would be—the rightful guardian of my child, and could at once have taken him from Silas, who would then have no shadow of interest in the matter. However, I proposed perfectly fair terms. I offered to take a fourth—himself and the boy to have the same each, and the parties behind the scenes to take the rest. But he laughed at me—the fool! It

would have been more like him, more like a man who delights in falsehood and deceit, to have promised, and then have tried to cheat me afterwards. But no! As if he was already lord and master, he carries it with a high hand, and says I may have ten shillings a week, or a fifty-pound note down—and this if I behave myself! Do you know why he thinks this good enough for me?

'No,' replied her hearer; his mouth had grown so dry and parched that he could scarce gasp out the syllable.

'Because, he says, I have nothing to do with the scheme,' pursued the woman. 'And he is right. I have not. When you prosecuted him, or caused him to be prosecuted, it is all the same, he got hold of a lawyer's clerk, a worse man than himself, if possible. He told this man how I had entrusted my boy to him, to bring up in the country, as he was so delicate, with his own little son, about the same age. This clerk, hearing all his story, showed him how to make his fortune; and, through him, his employers agreed to find the money for all expenses. Perjury, of course, had to be freely dealt in; but I fancy Silas Bird was used to that.'

'Why perjury?' asked Dudley, to whom the woman's story was growing to be of intense interest.

'Because the same fever which killed his wife carried off my poor boy!' was the startling reply. 'He lies in a cemetery near Liverpool; and the child now brought forward is Silas Bird's own—neglected and treated as an encumbrance for years, but of importance now. Silas Bird's claim was easily worked. There were plenty of persons who could swear that he had taken charge of my child, and were also ready to swear to this being the same—honestly enough, on their parts. They thought they were right, and had never heard of his son or of the death of mine. In fact, everything turned out easier than he and his friends had expected; and if he had not sent me an account of my boy's death and funeral, I should have known no better than others; or if my husband had not died, and so caused my return to England, all would have gone well with Silas. But above all, if he had not arranged to cheat me—if he had not sneered at me and laughed at my pleas, I tell you candidly he might have done his worst, as I owed you no gratitude. I have done you a good turn, however; what will you do for me?'

Dudley opened his lips to reply; but ere he uttered a syllable, to the astonishment and not a little to the alarm of his visitor, he burst into an hysterical fit of tears and sobbing, the first time any one had seen an approach to such emotion in the hard selfish Dudley; but the reaction was too great. The woman rose to approach him; but he waved her off, controlled himself by a great effort, and then spoke as collectedly as before.

His promises were ample, and fully secured the partisanship of the woman. But the rest of their conversation need not be detailed here.

Ere she left, a plan had been decided upon; and as Dudley was not the man to linger over his vengeance, he was in the private room of the stipendiary magistrate at the police court as soon as it was open on the next morning, as was also Mrs Meadows, his visitor of the overnight. The

magistrate was not a little startled on hearing the latter's story, and at once issued warrants for the apprehension of Silas Bird and his confederate, the lawyer's clerk. It would clearly be impossible to prove that the latter's employer had a guilty knowledge of the conspiracy, although there could be no great doubt on the matter.

But the clerk's plans had been better arranged than they had suspected. He must have had an ally at the police court, and provided by a convenient act of treachery for even such a contingency as this, for the warrants were not executed, inasmuch as Silas Bird and the clerk each disappeared from the town that morning, and were never again seen therein, nor was any trace of them discovered.

The poor little boy who was to have been used as the chief instrument in the fraud was left to the mercy of the parish or of any one who chose to befriend him. To the credit of Dudley, be it said, the poor child did not lack a friend. He provided for the little fellow, and was not without a reward in the gratitude and good conduct of his protégé; nor without a greater reward in his own increased comfort. Perhaps his recent trial had softened him; it is certain that he lived more happily with his wife, and indeed he was heard to declare more than once that Silas Bird had done him a good rather than an ill turn.

The unlucky widow, Mrs Meadows, was offered a comfortable allowance by Dudley; but she preferred a sum down, and with this potent attraction, found no difficulty in captivating a third husband, with whom, for the second time, she tried her fortune in a foreign clime, this time in Australia. So much Mr Starbert-Smithers heard of her; but no further tidings ever reached him, and he could hardly be expected to repine at this result.

A SPRING CHANSON.

The glad Spring-tide is here again;
The thrushes sing all day;
We've violets in the sheltered glen,
And gorse-bloom on the brae;
Along a green and daisied world,
The lights and shadows flit;
The cherry-trees with buds are pearled,
The crocus lamps are lit.

From gnarled apple-boughs the buds
Of perfumed white and red
Are peeping forth; in scented woods,
The wind-flower lifts its head;
In lonely swamp and hollow springs
The wild marsh marigold;
Beneath the flow'ring currant, sings
A blackbird gay and bold.

The shimmering sunbeams sport and play
Upon the beeches tall,
And rest on the laburnums gay
Beside the garden wall.
Oh, glad Spring-time; from shore to shore
Your gifts are scattered free,
And best of all, you bring once more
My true love back to me!

THE HIGHEST RAILWAY IN THE WORLD.

WHEN the locomotive steam-engine was first thought of, it was considered that smooth wheels on smooth rails would not give the requisite amount of friction or adhesion so as to secure a due power of haulage. Rack rails and toothed wheels were therefore at first provided; and it was due to the ingenious William Bedley, who in 1813 patented his 'Puffing Billy,' that experiments were made to prove the opposite. In some mountain railways, however, such as those of the Mont Cenis and Righi, the rack and pinion system has been used by preference to the smooth rail. Another mistaken notion which experience has since disproved was, that it would be necessary to have the lines laid as nearly level as possible; while now it is well known that an engine and carriages with smooth wheels will ascend a very considerable acclivity. The more level a line is, the more economical of course is the working of it; at the same time, it is long since it was ascertained that this quality was not an indispensable element in the making of railways. Some railway lines, indeed, mount very great heights; but that one which outstrips them all is the Central Railway of Peru, which crosses the Andes at the height of 15,635 feet above sea-level—or, in other words, a height equal to the summit of Mont Blanc.

The Peruvian railways are mostly short, generally running from the coast inland to the foot of the Andes. The line, however, from Callao and Lima to Oroya—now known as the Central Railway—is, with the exception of the Southern, longer than all the others, though the distance between its two extremities is after all only one hundred and thirty-six miles. But before the railway could be made to cross the mountain ridge at the great elevation above given, immense difficulties had to be overcome. It has been described as threading the intricate gorges of the Andes by a winding path along the edges of precipices, through tunnels, and over bridges that

seem suspended in the air. The portion between Chicla and Oroya, a distance of but fifty miles, contains no fewer than sixteen tunnels; the highest tunnel—that which crosses the Andes at the height of Mont Blanc, and known as the Galera Tunnel—being over 1500 yards in length.

The Central Railway of Peru has been constructed under other than engineering difficulties. It was begun in 1870, and for a time the work went forward well; but in consequence of the disastrous war with Chili, the Government of the country was unable to carry out the great public works then in hand. Many millions of money had been raised by loan in England; but interest not having been paid upon this for some years, an arrangement was made by which the bondholders were to carry on certain portions of these public works. That arrangement, known as the Grace-Donoughmore Contract, was finally ratified in the beginning of 1890, under which arrangement the Foreign Bondholders released Peru of all the responsibility for the 1870 and 1872 debts, on condition that all the railways of the State should be ceded to them for a period of sixty-six years, the bondholders further undertaking to complete and extend the existing railways. It is therefore under their auspices, associated as they now are under the title of the Peruvian Corporation, Limited, that the railways of the country are being brought to completion. A sum of nearly five millions sterling had up to last year been spent upon the construction of the Central; and as it is expected to be completed by the middle of this year, a wide tract of country, rich in various kinds of minerals and other articles of commerce, will thus be made accessible to European and indeed world-wide enterprise.

The principal engineering structure in connection with this railway was the Verrugas Bridge. This bridge, which was built in 1872, was at the time of its erection the highest in existence; but unfortunately, it was destroyed by a cloud-burst in the spring of 1889, and a second has since been erected on the same site.

The first Verrugas Bridge was 575 feet long,

and consisted of three iron piers or towers connected by what are called Fink trusses; the western pier being 179 feet high, the centre one 252 feet high, and the eastern pier 146 feet. The bridge spans an abrupt and rocky ravine which dips deeply to the centre, through which a small stream flows; hence the great irregularity in the height of the piers or towers. The bridge, considering its altitude and the nature of the structure, was built in a very short time—only ninety-five days, it is said, having elapsed between the arrival of the ironwork at Callao and the completion of the structure. According to 'The Engineering and Mining Journal,' the engineer in charge of the construction, Mr L. L. Buck, of New York, succeeded in erecting the towers entirely without scaffolding, this being accomplished by passing four cables over the chasm, and putting 'travellers' on them, from which the ironwork for the piers was lowered member by member. It is added that Mr Buck was the originator of the system.

He also devised an ingenious method of accurately locating the piers, necessary on account of the great roughness of the situation. For this purpose, after the position of each pier had been located by triangulation, a steel tape long enough to reach from abutment to abutment (575 feet) was suspended from temporary trestles over a level stretch of ground, the ends of the tape being brought to a definite tension by suspended weights, and the position of the piers as laid out on the level ground carefully marked upon it. It was then suspended over the chasm under exactly similar conditions, and sights were taken from the points below, located for the piers by triangulation, to the marked points on the tape, and the accuracy of the instrumental work thus proved.

For a period of seventeen years the bridge admirably served the purpose for which it had been constructed; but there was one defective element in the plan of its erection. The central pier rested in the bottom of the ravine; consequently, when on the 23d of March 1889 a cloud-burst took place in the vicinity, and an immense volume of water, mingled with earth and stones, was precipitated down the ravine, the central tower could not resist the pressure. It was swept away, and carried with it almost the whole of the structure. It is not related that any accident to life or limb was involved in the destruction of the bridge. Its fall greatly impeded the traffic on the railroad; but a temporary wire cable was thrown across the chasm, by which, in a swinging carriage, passengers and light freight could be transferred from one side of the gap to the other.

Before taking leave of the old bridge altogether, it must be noted that the Verrugas stream which it crossed, and from which the bridge derived its name, has given name also to a new disease. Few, says one writer on the subject, who have read the old accounts of the construction of the bridge, can hear the word 'Verrugas' without associating it with the dread disease which bears its name and which carried off so many men. It is generally believed that it came from drinking the water from the Verrugas stream, as the disease is only local, not being known beyond two miles up or down the Rimac Valley. It was marked by fever, rheumatic pains, lack of appe-

tite, and breaking out of terrible warts, especially on the chest, which bled on the slightest provocation, and often resulted in death. Another writer says that the disease appears in the form of immense warts on the face and body, occasioning much internal pain, and is attributed by some authorities to the turning over of fresh soil, and by others to injurious properties in the water in the neighbourhood. 'It may frequently be seen disfiguring the faces of the workmen here; and during the erection of the bridge, as many as eighteen daily are said to have succumbed to it. Most passers through are careful in the matter of drinking water, and take only that which has been boiled.'

Soon after the collapse of the old bridge, the Peruvian Government took steps to replace it by a better and more durable structure. The work was again entrusted to Mr Buck, who this time avoided the weakness of the former bridge, by doing away with the central pier resting in the bottom of the gully, and by having only two piers instead of three. These two piers spring from the rocky sides of the chasm, leaving the channel of the stream quite clear, the centre span of the bridge being therefore 285 feet in length. The bridge is for a single line of rails, and is designed to carry as a safe load two locomotives of 97,000 pounds each, with freight cars weighing 3000 pounds per running foot, and to resist a wind pressure of fifty pounds per square foot, thus ensuring a large factor of safety. The weight of iron in the new bridge is 700 tons, and the cost was something like £100,000. The new bridge was completed in the beginning of last year.

A lady, Miss E. B. Clark, who has recently travelled in this region, has, in her *Twelve Months in Peru* (London: T. Fisher Unwin), given some striking pictures of the hills and valleys through which the Central Railway runs—the Sierra or Central region of Peru, 'where fertile valleys occur, where precious metals are found, and where the gentle llama finds its home.'

At fifty miles inward, or eastward, from Lima, the railway reaches 4949 feet above the ocean level; and after crossing the Verrugas bridge and reaching Matucana, the traveller finds himself at 7788 feet above the level of the sea. At Chila the height attained is 12,220 feet; and here, what is called *sorroche*, or the difficulty of breathing at high altitudes, assails the traveller. 'A headache, with a weighty feeling on the brow, vomiting, and breathlessness, are the usual symptoms of *sorroche*; although, in its severer forms, it causes fainting-fits, bleeding at the nose and ears. Stout people, as a rule, succumb most readily to its attacks; and garlic and patience are the best remedies for all.' After the lapse of a few days, however, the health is generally better in the mountains than on the coast; although it is never possible to undertake much physical exertion there, unless, adds the lady, 'one chances to be Sierra born and bred.' Any one who remembers M. Saussure's experiences on his, the first, ascent of Mont Blanc, and the experiences of other Alpine climbers since, will quite understand how this may be. In crossing the Andes by the highest tunnel of all—that nearly 16,000 feet above sea-level—this feeling of oppression must be still more painful.

To ascend by this line is one thing; to descend is another. 'A low hand-car, drawn by gravity,' says the lady we quote from, 'is despatched from Chila about fifteen minutes in advance of the train, to clear the line of fallen pieces of rock that threaten to impede its downward course. These hand-cars travel at the rate of about forty-five miles an hour down steep inclines, and round such frequent curves, as to cause the uninitiated many tightenings of the heart-strings as they dwell upon the fact that a tiny piece of rock, a skirt entangled in the wheels, a dog, a cow, or any other animal, may at a moment's notice upset the toy vehicle, and usher all its inmates down a precipice and into eternity at one stroke; or at anyrate involve the loss of a cherished limb; for it is a difficult matter to effect an instantaneous stoppage where the gradient is so steep. Those who are accustomed to this mode of travelling describe it as delightful in spite of constant breathlessness; and when descending from Chosica to Lima, I confess that I found the journey extremely pleasant; but here the gradient is not so steep, and the speed proportionately less. The great essentials to safety and comfort are a cautious and skilful driver, plenty of warm clothing tightly tucked in, a hat almost glued to the head, and a thick veil, if one prefers not being skinned by the wind whilst moving with such rapidity through it.'

The completion of the Central and other railways in Peru is sure to have a very beneficial effect upon the future prospects of that country. It is, besides, intended to carry a branch of the Central to the river Ucayali, one of the principal tributaries of the upper Amazon, and in this way to provide a through route across the widest portion of the South American continent. Peru is a country rich in silver, copper, and other minerals; and if it be once made accessible by the development of its railway system, a new era of prosperity may be expected to set in.

THE IVORY GATE.*

By WALTER BESANT.

CHAPTER VI.—SOMETHING MORE HAPPENS.

CHECKLEY held the door of the office wide open and invited Elsie to enter. The aspect of the room, solid of furniture, severe in its fittings, with its vast table covered with papers, struck her with a kind of terror. At the table sat her guardian, austere of countenance.

All the way along she had been imagining a dialogue. He would begin with certain words. She would reply, firmly but respectfully, with certain other words. He would go on. She would again reply. And so on. Everybody knows the consolations of imagination in framing dialogues at times of trouble. They never come off. The beginning is never what is expected, and the sequel, therefore, has to be changed on the spot. The conditions of the interview had not been realised by Elsie. Also the beginning

was not what she expected. For her guardian, instead of frowning with a brow of corrugated iron and holding up a finger of warning, received her more pleasantly than she had imagined it possible for him, bade her sit down, and leaned back, looking at her kindly.

'And so,' he said, 'you are twenty-one—twenty-one—to-day. I am no longer your guardian. You are twenty-one. Everything that is past seems to have happened yesterday. So that it is needless to say that you were a baby only yesterday.'

'Yes; I am really twenty-one.'

'I congratulate you. To be twenty-one is, I believe, for a young lady at least, a pleasant time of life. For my own part I have almost forgotten the memory of youth. Perhaps I never had the time to be young. Certainly I have never understood why some men regret their youth so passionately. As for your sex, Elsie, I know very little of it except in the way of business. In that way, which does not admit of romance, I must say that I have sometimes found ladies importunate, tenacious, exacting, persistent, and even revengeful.'

'Oh!' said Elsie, with a little winning smile of conciliation. This was only a beginning—a prelude—before the unpleasantness.

'That, Elsie, is my unfortunate experience of women—always in the way of business, which of course may bring out the worst qualities. In society, of which I have little experience, they are doubtless—charming—charming.' He repeated the word, as if he had found an adjective of whose meaning he was not quite clear. 'An old bachelor is not expected, at the age of seventy-five, to know much about such a subject. The point before us is that you have this day arrived at the mature age of twenty-one. That is the first thing, and I congratulate you. The first thing.'

'I wonder,' thought Elsie timidly, 'when he will begin upon the next thing—the real thing.'

There lay upon the table before him a paper with notes upon it. He took it up, looked at it, and laid it down again. Then he turned to Elsie and smiled—he actually smiled—he unmistakably smiled. 'At twenty-one,' he said, 'some young ladies who are heiresses come into their property'—

'Those who are heiresses. Unhappily, I am not.'

'Come into their property—their property. It must be a beautiful thing for a girl to come into property, unexpectedly, at twenty-one. For a man, a temptation to do nothing and to make no more money. Bad! Bad! But for a girl already engaged, a girl who wants money, a girl who is engaged—eh?—to a penniless young solicitor'—

Elsie turned crimson. This was the thing she expected.

'Under such circumstances, I say, such a stroke of fortune would be providential and wonderful, would it not?'

She blushed and turned pale, and blushed again. She also felt a strong disposition to cry—but repressed that disposition.

'In your case, for instance, such a windfall would be most welcome. Your case is rather a singular case. You do not belong to a family

* Copyright 1892 in the United States of America by Harper & Brothers.

which has generally disregarded money—quite the reverse—you should inherit the love of money—yet you propose to throw away what I believe are very good prospects, and’—

‘My only prospect is to marry George Austin.’

‘So you think. I have heard from your mother, and I have seen your sister Hilda. They object very strongly to the engagement.’

‘I know, of course, what they would say.’

‘Therefore, I need not repeat it,’ replied Mr Dering dryly. ‘I learn, then, that you are not only engaged to this young gentleman, but that you are also proposing to marry upon the small income which he now possesses.’

‘Yes—we are prepared to begin the world upon that income.’

‘Your mother asked me what chance he has in his profession. In this office he can never rise to a considerable salary as managing clerk. If he had money, he might buy a partnership. But he has none, and his friends have none. And the profession is congested. He may remain all his life in a position not much better than he now occupies. The prospect, Elsie, is not brilliant.’

‘No—we are fully aware of that. And yet’—

‘Allow me, my dear child. You are yourself—we will say for the moment—without any means of your own.’

‘I have nothing.’

‘Or any expectations, except from your mother, who is not yet sixty.’

‘I could not count upon my mother’s death. Besides, she says that, if I persist, she will not leave me anything at all.’

‘So much I understand from herself. Her present intention is to remove your name from her will, in case you go on with this proposed marriage.’

‘My mother will do what she pleases with her property,’ said Elsie. ‘If she thinks that I will give way to a threat of this kind, she does not know me.’

‘Do not let us speak of threats. I am laying before you facts. Here they are plainly. Young Austin has a very small income: he has very little prospect of getting a substantial income: you, so far as you know, have nothing; and, also so far as you know, you have no prospect of anything. These are the facts, are they not?’

‘Yes—I suppose these are the facts. We shall be quite poor—very likely, quite poor always.’ The tears rose to her eyes. But this was not a place for crying.

‘I want you to understand these facts very clearly,’ Mr Dering insisted. ‘Believe me, I do not wish to give you pain.’

‘All this,’ said Elsie, with the beginnings of the family obstinacy in her eyes, ‘I clearly understand. I have had them put before me too often.’

‘I also learn from your sister, Lady Dering, that if you abandon this marriage she is ready to do anything for you that she can. Her house, her carriage, her servants—you can command them all, if you please. This you know. Have you considered the meaning of what you propose? Can you consider it calmly?’

‘I believe we have.’

‘On the one side poverty—not what is called a small income. Many people live very well on what is called a small income—but grinding, hard poverty, which exacts real privations and burdens you with unexpected loads. My dear young lady, you have been brought up to a certain amount of plenty and ease, if not to luxury. Do you think you can get along without plenty and ease?’

‘If George can, I can.’

‘Can you become a servant—cook, housemaid, lady’s-maid—as well as a wife—a nurse as well as a mother?’

‘If George is made happier by my becoming anything—anything, it will only make me happier. Mr Dering, I am sure you wish me well—you are my father’s old friend—you have always advised my mother in her troubles—my brother was articled to you—but’—She paused, remembering that he had not been her brother’s best friend.

‘I mean the best possible for you. Meantime, you are quite fixed in your own mind: you are set upon this thing. That is clear. There is one other way of looking at it. You yourself seem chiefly desirous, I think, to make the man you love happy. So much the better for him.—Are you quite satisfied that the other party to the agreement, your lover, will remain happy while he sees you slaving for him, while he feels his own helplessness, and while he gets no relief from the grinding poverty of his household—while—lastly—he sees his sons taking their place on a lower level, and his daughters taking a place below the rank of gentlewoman?’

‘I reply by another question.—You have had George in your office as articled clerk and managing clerk for eight years. Is he, or is he not, steadfast, clear-headed, one who knows his own mind, and one who can be trusted in all things?’

‘Perhaps,’ said Mr Dering, inclining his head. ‘How does that advance him?’

‘Then, if you trust him, why should not I trust him? I trust George altogether—together. If he does not get on, it will be through no fault of his. We shall bear our burden bravely, believe me, Mr Dering. You will not hear him—or me—complain. Besides, I am full of hope. Oh! it can never be in this country that a man who is a good workman should not be able to get on. Then I can paint a little—not very well, perhaps. But I have thought—you will not laugh at me—that I might paint portraits and get a little money that way.’

‘It is quite possible that he may succeed, and that you may increase the family income. Everything is possible. But, remember, you are building on possibilities, and I on facts. Plans very beautiful and easy at the outset often prove most difficult in the carrying out. My experience of marriages is learned by fifty years of work, not imaginative, but practical. I have learned that without adequate means no marriage can be happy. That is to say I have never come across any case of wedded poverty where the husband or the wife, or both, did not regret the day when they faced poverty together instead of separately. That, I say, is my experience of such marriages. It is so easy to say that hand in hand evils may be met and endured which would be intoler-

able if one was alone. It isn't only hand in hand, Elsie. The hands are wanted for the baby, and the evils will fall on the children yet unborn.'

Elsie hung her head. Then she replied timidly: 'I have thought even of that. It only means that we go lower down in the social scale.'

'Only? Yet that is everything. People who are well up the ladder too often deride those who are fighting and struggling to get up higher. It is great folly or great ignorance to laugh. Social position, in such a country as ours, means independence, self-respect, dignity, all kinds of valuable things. You will throw these all away—yet your grandfathers won them for you by hard work. You are yourself a gentlewoman—why? Because they made their way up in the world, and placed their sons also in the way to climb. That is how families are made—by three generations at least of steady work uphill.'

Elsie shook her head sadly. 'We can only hope,' she murmured.

'One more word, and I will say no more. Remember, that love or no love, resignation or not, patience or not, physical comfort is the beginning and the foundation of all happiness. If you and your husband can satisfy the demands of physical comfort, you may be happy—or at least resigned. If not—Well, Elsie, that is all. I should not have said so much had I not promised your mother and your sister. I am touched, I confess, by your courage and your resolution.'

'We mean never to regret, never to look back, and always to work and hope,' said Elsie. 'You will remain our friend, Mr Dering?'

'Surely, surely.—And now?—'

'Now'—Elsie rose—'I will not keep you any longer. You have said what you wished to say very kindly, and I thank you.'

'No.—Sit down again; I haven't done with you yet, child. Sit down again. No more about that young villain—George Austin.' He spoke so good-humouredly, that Elsie complied wondering, but no longer afraid. 'Nothing more about your engagement. Now, listen carefully, because this is most important. Three or four years ago a person wrote to me. That person informed me that he—for convenience we will call the person a man—wished to place a certain sum of money in my hands in trust—for you.'

'For me? Do you mean—in trust? What is Trust?'

'He gave me this sum of money to be given to you on your twenty-first birthday.'

'Oh!' Elsie sat up with open eyes. 'A sum of money?—and to me?'

'With a condition or two. The first condition was, that the interest should be invested as it came in: the next, that I was on no account—mind, on no account at all—to tell you or any one of the existence of the gift or the name of the donor. You are now twenty-one. I have been careful not to afford you the least suspicion of this happy windfall until the time should arrive. Neither your mother, nor your sister, nor your lover, knows or suspects anything about it.'

'Oh!' Elsie said once more. An interjection may be defined as a prolonged monosyllable, generally a vowel, uttered when no words can do justice to the subject.

'And here, my dear young lady'—Elsie cried 'Oh!' once more because—the most curious thing in the world—Mr Dering's grave face suddenly relaxed and the lines assumed the very benevolence which she had, the day before, imparted to his portrait, and wished to see upon his face!—'Here, my dear young lady'—he laid his hand upon a paper—'is the list of the investments which I have made of that money. You have, in fact, money in Corporation bonds—Newcastle, Nottingham, Wolverhampton. You have water shares—you have gas shares—all good investments, yielding at the price of purchase an average of nearly three and two-thirds per cent.'

'Investments? Why—how much money was it, then? I was thinking when you spoke of a sum of money, of ten pounds, perhaps.'

'No, Elsie, not ten pounds. The money placed in my hands for your use was over twelve thousand pounds. With accumulations, there is now a little under thirteen thousand.'

'Oh!' cried Elsie for the third time and for the same reason. No words could express her astonishment.

'Yes; it will produce about four hundred and eighty pounds a year. Perhaps, as some of the stock has gone up, it might be sold out and placed to better advantage. We may get it up to five hundred pounds.'

'Do you mean, Mr Dering, that I have actually got five hundred pounds a year—all my own?'

'That is certainly my meaning. You have nearly five hundred pounds a year all your own—entirely for your use, without any conditions whatever—your own.'

'Oh!' She sat in silence, her hands locked. Then the tears came into her eyes. 'Oh George!' she murmured, 'you will not be so very poor after all.'

'That is all I have to say to you at present, Elsie,' said Mr Dering. 'Now you may run away and leave me. Come to dinner this evening. Your mother and your sister are coming. I shall ask Austin as well. We may perhaps remove some of those objections. Dinner at seven sharp, Elsie.—And now you can leave me.'

'I said last night,' said Elsie, clasping her hands with feminine superstition, 'that something was going to happen. But I thought it was something horrid. Oh, Mr Dering, if you only knew how happy you have made me! I don't know what to say. I feel stunned. Five hundred pounds a year! Oh, it is wonderful! What shall I say? What shall I say?'

'You will say nothing. Go away now. Come to dinner this evening.—Go away, my young heiress. Go and make plans how to live on your enlarged income. It will not prove too much.'

Elsie rose. Then she turned again. 'Oh, I had actually forgotten. Won't you tell the man—or the woman—who gave you that money for me, that I thank him from my very heart? It isn't that I think so much about money; but oh! the dreadful trouble that there has been at home because George has none—and this will do something to reconcile my mother. Don't you think it will make all the difference?'

'I hope that before the evening you will find that all opposition has been removed,' said her guardian cautiously.

She walked away in a dream. She found herself in Lincoln's Inn Fields: she walked all round that great square, also in a dream. The spectre of poverty had vanished. She was rich: she was rich: she had five hundred pounds a year. Between them they would have seven hundred pounds a year. It seemed enormous. Seven hundred pounds a year! Seven—seven—seven hundred pounds a year!

She got out into the street called Holborn, and she took the modest omnibus, this heiress of untold wealth. How much was it? Thirteen millions? or thirteen thousand? One seemed as much as the other. Twelve thousand: with accumulations: with accumulations—ations—ations. The wheels of the vehicle groaned out these musical words all the way. It was in the morning when the Bayswater omnibus is full of girls going home to lunch after shopping or looking at the shops. Elsie looked at these girls as they sat along the narrow benches. 'My dears,' she longed to say, but did not, 'I hope you have every one got a brave lover, and that you have all got twelve thousand pounds apiece—with accumulations—twelve thousand pounds—with accumulations—ations—ations—realising four hundred and eighty pounds a year, and perhaps a little more. With accumulations—ations—ations—accumulations.'

She ran into the house and up the stairs singing. At the sound of her voice her mother, engaged in calculations of the greatest difficulty, paused wondering. When she understood that it was the voice of her child and not an organ-grinder, she became angry. What right had the girl to run about singing? Was it insolent bravado?

Elsie opened the door of the drawing-room and ran in. Her mother's cold face repelled her. She was going to tell the joyful news—but she stopped.

'You have seen Mr Dering?' asked her mother.

'Yes; I have seen him.'

'If he has brought you to reason'—

'Oh! He has—he has. I am entirely reasonable.'

Mrs Arundel was astonished. The girl was flushed of face and bright of eye; her breath was quick; her lips were parted. She looked entirely happy.

'My dear mother,' she went on, 'I am to dine with him to-night. Hilda is to dine with him to-night. You are to dine with him to-night. It is to be a family party. He will bring us all to reason—to a bag full of reasons.'

'Elsie, this seems to me to be mirth misplaced.'

'No—no—in its right place—reasons all in a row and on three shelves, labelled and arranged and classified.'

'You talk in enigmas.'

'My dear mother'—yet that morning the dear mother would not speak to the dear daughter—'I talk in enigmas and I sing in conundrums. I feel like an oracle or a Delphic old woman for dark sayings.'

She ran away, slamming the door after her. Her mother heard her singing in her studio all to herself. 'Can she be in her right mind?' she asked anxiously. 'To marry a Pauper—to

receive the admonition of her guardian—and such a guardian—and to come home singing. 'Twould be better to lock her up than let her marry.'

(To be continued.)

MISSING SHIPS.

SHIPPING casualties are rightly regarded as more or less intimately connected with the state of the weather, as a cursory glance at the shipping papers readily reveals. A summer's sun illumines the well-favoured face of old Ocean and gilds the delicate outlines of some speeding ship. Every omen seems propitious, and her crew would agree without hesitation that life is well worth living under such conditions. Soon her ponderous anchor is weighed and hove up to the bow in unison with the soul-stirring strains of an old-fashioned sea-song rolled forth in somewhat melodious measure by stalwart seamen, who thus bid a long farewell to the land they love and the girls they leave behind them. Then her scanty crew move briskly about both on deck and aloft, exhorted thereto by clearly defined commands, which to a landsman appear but to make confusion worse confounded. Nevertheless, there is a method in this apparently midsummer madness displayed in getting under way, for, with amazing rapidity, each snow-white sail is spread to the best advantage in order to woo the freshening breeze.

As the graceful ship cleaves her way through the resisting medium in which she floats, a white feathery foam lovingly laves her straining hull, passes aft, and leaves a whirling wake as far as the eye can see in the direction of the receding horizon. Before nightfall, however, a churlish sky affords every indication of an approaching storm; the mercurial column surely sinks in that unfailing monitor the barometer, and sail is reduced without delay. Perchance a rugged, inhospitable coast lies not far distant down the wanton wind, which sweeps across the devoted vessel's rigging, taut as harpstrings at their highest tension. Down comes the careering storm as if the very heavens had burst with its fury, and lashes the sea-surface into hurtling crests with yawning gulfs between. The ship heels over before the bitter blast, fails to right herself, and in the twinkling of an eye the triumphant sea rages over her upturned keel, eager to rive her stricken hull asunder while her brazen bell tolls a requiem; or she disappears into the seething abyss of waters as utterly as though she had never been; and the brave hearts which throbbed so exultingly at early morn in the plenitude of their power are stilled for ever.

Even well-found ships occasionally meet their fate in this way, and not infrequently without leaving the most insignificant remnant whereby they might be traced. It may be supposed that their lighter fittings would eventually drift ashore somewhere; but actual experience has demonstrated conclusively that any inference of this nature is erroneous in a large majority of instances, for, if fragments do reach the land, it is to lie unnoticed on some lonely beach until long after possible recognition. When far from the land, a vessel may be overwhelmed by an

exceptionally heavy sea; capsized by a sudden squall; sunk by collision with an iceberg, a drifting abandoned vessel, or another ship under control, but negligently navigated; or burnt by spontaneous combustion of cargo, by lightning, or by accident. Frequently, the result is equally fatal to the crews, even if for a time they linger through untold agonies in open boats.

Early in the morning of the 9th of March 1891, a terrible storm was travelling in from the North Atlantic swiftly, yet surely, towards the south-west coast of England. March had come in like a lion, in agreement with the old adage; nevertheless, this particular dawn gave every promise of a fine day. Not only were local weather prophets caught napping, but also the London Weather Department. About eleven o'clock in the morning snow was falling at Plymouth, with a gradually increasing breeze, which, when the sun sank sullenly below the horizon, had attained to almost hurricane violence, and was sweeping all before it. Wrecks strewed the coast between Start Point and Falmouth, where many a seafarer lost his life, and cruel suffering entailed upon those who survived the storm.

Two Liverpool vessels, the *Marana*, a steamship of 1632 tons register, bound to Colombo; and the *Dryad*, a full-rigged sailing-ship of 1035 tons, bound for Valparaiso, went ashore within a short span of each other, when over fifty lives were sacrificed. Two small schooners, the *Lunesdale* and the *Lizzie Ellen*, also came to grief. A steamship, the *Dundela*, from St Michael with fruit, was lost during the night near Falmouth; and next morning the splendid four-masted ship, *Bay of Panama*, of 2282 tons register, from Calcutta, with 17,000 bales of jute for Dundee, was driven on shore. Captain Wright, his wife, five officers, four apprentices, and six of her seamen, were either washed away or frozen to death while lashed to the rigging awaiting succour. Wires were all down, and some time necessarily elapsed before news reached the gallant little band of coastguardmen, although every effort was made, even in the height of the storm, by dwellers on shore to make known the disaster and render assistance.

More than thirty small sailing-craft making passages between ports situated around our south-west coasts have been posted as missing in consequence of that storm. These vessels ranged from thirty to three hundred tons register, carried from three to nine men each, and were as a rule laden with heavy cargoes, such as coal, slate, and ore. A recently published table sets forth the names, ports of registry, tonnage, and other particulars of British ships posted or reported as missing during the year ended 30th June 1891. No fewer than eighty-five vessels disappeared beneath the waves during that period. Eighty of these unfortunates were carrying-craft, four were fishing-boats, and there was also one pleasure yacht. Thirteen were staunch sailing-vessels, twelve iron and one wood, of over one thousand tons register, nearly all of which at various times have come under the writer's personal observation. The Clyde and the Mersey each owned five; Dundee, London, and Nova Scotia, one each. Three were bound from New Zealand to London with cargoes of frozen meat, having previously made several successful voyages in the same trade

over a similar track. A Liverpool ship, the *Lord Raglan*, of 2078 tons register, was the largest missing ship during the twelve months. She was almost a new vessel, and coming home from San Francisco with a costly cargo of grain.

Some seven hundred miles from the Cape of Good Hope, on the track to Australia over the southern sea, lies a group of islands known as the Crozets, which are uninhabited, but where, during the past seventy years, men from missing ships have spent many months in misery and the gnawing despair of hope long deferred. A vessel named *Princess of Wales* struck on one of these rocky pinnacles and sank. Her crew escaped in two boats, that both reached the inhospitable shore, but in different parts, effectually inaccessible one from the other by reason of intervening natural obstacles. From March to December the two parties were cut off from each other; but in the latter month, the southern midsummer, they were reunited by accident. Their food consisted of seals and seabirds; their clothes were fashioned from sealskins sewn together with sea-elephant sinews by means of an old nail which had been converted into a needle. Friends at home had long given up all hope, when, after twenty-two months of leaden-footed hours had elapsed, a whaling schooner, the *Philo* of Boston, U.S.A., rescued them from a living death, and they were sent home.

An old sailor had taken upon himself the responsible duty of watching for passing ships; and when gladdened by the sight of this solitary sail, a mere speck upon the wide waste of waters, the attention of the crew was attracted by the red glare of a beacon fire. Upon a boat coming ashore for the long-lost ones, they scampered into the sea, casting off their sealskin garments by the way, in a natural eagerness to return once more to the haunts of civilisation. The rescuers were alarmed at first, fearing lest they might unwittingly have fallen in with an unknown race of wild men.

In 1876, an iron ship, the *Strathmore*, with her crew of thirty-eight men and fifty passengers, went on shore at Apostle Island. Only forty-nine out of the eighty-eight people on board were saved, including a woman and a child. Little wreckage of any value to the shipwrecked crew came on shore except a chest containing a few coverlets, knives and forks, spoons, preserved meats, and two parasols. Strange to say, these parasols were especially useful, inasmuch as the ironwork about them was made into needles, with which skins were sewn together to make necessary garments by means of thread drawn out from canvas, or, failing this, the longest grass available. Preserved meat-cans served for saucepans, which when worn out were replaced by hollow stones. From July to January only four vessels passed their island above the horizon; but signals made by the people of the *Strathmore* were probably unperceived. The captain of an American whaler passing by this out-of-the-way island, went aloft to view more distinctly the dangerous rocks, and noticing something strange, stood in to discover its meaning. Shore-signals were reported from the whaler's elevated 'crow's nest'; and boats sent on shore brought back the survivors of the ill-fated *Strathmore*. Five had succumbed to privations experienced on this isolated island;

but the American captain gave up his cruise in order to land the others at the nearest port.

Still later, the *Knowsley Hall* utterly disappeared, and it was thought that some of her crew, together with men from several other missing ships, might have reached the Crozets. Her Majesty's ship *Comus*, Captain East, was despatched; but after careful search, not a trace of any castaway crew was observed. A cairn erected by the *Strathmore* party was still erect, and easily distinguishable from afar. An old hut was found on Apostle Island, which was at once stocked with provisions suitable for shipwrecked people. Huts were built by the men of the *Comus* on Hog Island and Possession Island, and well filled with tinned meats. A board affixed to each dwelling-place bore the following notice: 'These provisions are only for shipwrecked people. H.M.S. *Comus*, March 6, 1880.'

Quite recently, a request was made to the Admiralty to send a warship on a similar errand; but none could be spared. Nevertheless, Captain Simpson, of the Aberdeen liner *Australasian*, took that steamship close to these islands; and after having made several gun-cotton signals, steamed away, well convinced that no castaways were there. Many vessels have disappeared in the vicinity of the Cape of Good Hope since first it was doubled. Another *Princess of Wales* is supposed to have foundered there with the whole of her crew and passengers, numbering some seven hundred souls. She was but one of a fleet that suffered severely, for there were lost that winter season off the Cape of Storms the *Ganges*, the *Skelton Castle*, the *William Pitt*, the *United Kingdom*, and four other old-time East Indiamen. In 1889 the large iron ship *Bolan* of Liverpool, and the *Glanpadarn*, both homeward-bound, are believed to have disappeared off this Cape. They probably had their cargoes shifted in a severe squall, and capsized.

Cape Horn, again, has an unenviable notoriety; and in 1889 Her Majesty's ship *Champion* searched every nook around Tierra del Fuego, but without avail, although some thought that men from the missing ships *Melanesia*, *Cumeria*, and *Bio-Bio* might have reached the land about there in open boats. Until quite recently, ships wrecked off Cape Horn left their crews as utterly desolate as though in mid-ocean; but now settlements have been made in several places, to which shipwrecked mariners may steer, and thus avoid the unfriendly natives of that forbidding coast.

Cruel coral reefs of the Pacific could doubtless account for many a missing ship. The French discoverer, La Pérouse, in the *Astrolabe*, sailed away from home for a voyage among the islands of the Pacific, and never returned. Long after, Captain Dillon, an officer of the British mercantile marine, was fortunate enough to obtain precise information as to the position of the sunken ships of La Pérouse. He brought back the relics to Paris, and obtained a substantial reward.

Collisions are not so frequent as might be assumed from the magnitude of the world's ocean traffic. Iron ships fare badly in collision unless divided into water-tight compartments. A sailing-ship, the *Loch Earn*, collided with the steamer *Ville du Havre*, a few years ago, when more than two hundred and twenty-five people were

drowned. Fortunately, the water-tight divisions of the sailing-ship held for some time, otherwise, crew and passengers of both vessels must inevitably have perished, as the steamer foundered in a few minutes, and the *Loch Earn* immediately her partitions were penetrated by the sea. Similarly, in the collision between the *Kapunda* and the *Ada Melmore*; the former sank with many female passengers locked in their berths below; but the water-tight compartments of the latter kept her afloat for a few hours, else not a soul would have escaped to tell the sad story, and both ships added to the long list of missing. Some years ago the barque *Exmouth*, with her crew of eleven men and two hundred and forty passengers, had a narrow escape from being classed as missing. She struck on the west coast of Islay, and went to pieces in a minute. Three men who had rushed aloft for safety were hurled with her topmast into a rocky chasm, and rescued next morning.

Ships making long passages are often given up as lost, and as much as ninety per cent. paid for re-insurance. The barque *Duppel* left Liverpool for Philadelphia in July 1889, and was one hundred and eleven days on the passage, or about the same length of time in which California is reached by sailing-ship. In August of the same year the Russian barque *Tahti* was spoken in the Baltic, one hundred and fifteen days out, with a cargo of salt from a Spanish port. The *Christabel* left London in September 1889 with Christmas stores for Newfoundland. She did not arrive, and ninety per cent. was paid for her re-insurance; but after being at sea for seventy-four days, she put back to Plymouth. About the same time the *Kate*, bound from Figueira to Newfoundland, put back to Salcombe, after buffeting seventy days against adverse winds. The brig *Dato* left Ayr for Demerara in December 1889, and was compelled by violent storms to put into a Norwegian port after sixty-five days. A German barque, the *Matador*, sailed from Shields for Valparaiso in July 1889, but did not arrive until one hundred and sixty-five days had elapsed, and ninety-three per cent. was paid for her re-insurance. The Norwegian barque *Evea* passed the Old Head of Kinsale on New-year's Day 1890; and nothing more having been heard of her, was reckoned among the missing; but fifty days later she arrived at Portland, having been all that time knocking about between the Irish and the English coasts.

Quite recently the barque *Ellen* foundered while making a passage between Australia and Noumea. Her crew of ten men took to the boat. Some died of thirst, others went mad and leaped overboard; but one survived to account for the missing men. A British sailing-vessel, the *Vailele*, bound from New Guinea to the Solomon Islands, was for forty days practically drifting about at the mercy of wind and current, with her crew worn out with fever. Had a storm arisen, she would certainly have been a missing ship. One of the largest sailing-ships ever launched, the French four-master *Dunkerque*, has just been posted as missing. She sailed from a Welsh coal-port on the 23d June 1891 with five thousand tons of coal for Rio Janeiro, and has not yet arrived. Her Majesty's ship *Volage* picked up a large boat belonging to her on the 25th July about twenty miles north of

Ushant; and still more recently, another of her boats has drifted ashore on the French coast. Such large sailing-ships, unless well manned, must be especially liable to disappearance in a sudden squall. A paragraph in the daily papers, a payment of insurance, a new ship built, and the missing ones in the whirl of business are forgotten, except by near relatives, who hope for their return even after many days. September and October storms of 1891 left many derelicts and not a few missing ships.

URGENT PRIVATE AFFAIRS.

CHAPTER IV.—RESCUED.

WHEN Nellie Morton left her room and wandered into the grounds for the second time that day, she was in a state of high and extremely unpleasant excitement. The thought of the river cooled and soothed her. Except on that side, the grounds of Garwood House were closed in, shut off from the free air of heaven by tall, stifling brick walls. On the Thames' side the grounds were open to the sweet broad flowing air of summer.

A girl could not escape over those high brick walls, old and sodden, and smelling dank in the sun. But one could escape by the river. Yes, one might be taken off by a passing boat. One might wander for months close to those greasy walls without seeing a living soul—such a thing as a meeting with young Chaytor that day might not occur again in a lifetime—but on the river, people would often be in view, passing by now and then.

Even supposing no boat came to take one away, *still* there was a Doorway of Escape on the river-side. It was the Doorway through which only the desperate went; but one did not know when one might become desperate.

Here was the river, and how much cooler to walk up and down by the stream than to breathe the choking atmosphere indoors. No boats were in sight just now, but no need for any existed at present. If desperate need of escape arose while no boats were at hand, there lay the Door for the desperate—the Water. That doorway could never be closed up. As long as Garwood House stood, it would remain free and open.

While she paced up and down, the violence of her perturbation subsided. She was able to survey more calmly the events of the last few hours. She no longer doubted that the scene after luncheon had occurred as it appeared to her. The dwarf, William Bathurst, had bounded into the room shouting with frenzied laughter, had told his mother he was bankrupt, had been seized by a fit; and on recovering, Mrs Bathurst had indicated to him that his only means of deliverance from ruin was by a marriage with herself, and so getting the money her father had laid by. If it ever came about that she was forced to select between the fate foredoomed for her by the old woman and the river, she would not hesitate a moment.

What should she do? Could she do anything? Of course, she could not be forced into a marriage with that fearful man. Those who thought she, Ellen Morton, could be bullied or cajoled into doing anything against her will, did not know anything at all of her, Ellen Morton. But her

uncle and aunt were gone out of England; her father was not coming home until the autumn; and between this time and autumn, matters would be very disagreeable for her if she continued a guest at Garwood House. And if she did not continue a guest there, whither should she go?

Here, against the wall, under this tree, stood a dilapidated rustic seat. She would sit and look deliberately at the case—the very hard and trying case in which she found herself.

At her back rose the end of the wall over which young Chaytor had climbed; on her left, just at the end of the seat, ran the river, silent and deep and dark in the shadow of beeches and willows; on her right lay a tangled wilderness of neglected undergrowth; in front of her stretched the dusty dry pathway, from which all verdure had been burned by a hot and droughty month.

Here, in the shade, the air was cooler and fresher than even on the unsheltered pathway by the river. She took off her hat, to let the breeze touch more freely her forehead and neck and hair. Her mind, instead of taking up the consideration of the future, ran back upon the past. She thought of the happy time spent with the bluff, kind-hearted, simple-minded Colonel and his affectionate, soft-mannered wife. She reviewed the peaceful days with them, and the frank modest gaieties of Deighton, where she had emerged from school into life and the world.

What an overwhelming contrast between that stirring garrison town and the lethargic stagnation of this Garwood House! And to think that only a week ago—nay, but yesterday—she had been there with her sweet-minded aunt and bluff uncle; and here she was to-day newed inside these repellent walls, with this chilling mysterious woman, and this man, more fearful and odious than any human being she had seen, than any nightmare which had ever made the silent chambers of darkness hideous!

She shuddered at the thought of the man. Then she started and looked round uneasily. Had that shudder shaken the leaves of the tree overhead? Impossible. Yet the leaves of the tree, or some other leaves near, had rustled more than the faint breeze would warrant. It was more than a rustle—it was a sound of rustling to which was added a sound of pushing among twigs. She looked round again. With a start, she sprang to her feet, pale, gasping, trembling. Some living thing was moving in the bracken on the right. It could not be a large animal, for nothing appeared above the ferns. It was pushing towards the river—towards her!—towards where she stood, shaking in every limb! Then all of a sudden a hideous lizard, huge, flat-backed, long-tailed, stole furtively into view and looking cunningly round out of one small evil eye, wagged his prodigious head and waddled slowly towards the girl.

On the wild impulse of escape from the loathsome reptile, she sprang backward, stumbled over the bank, and, with a scream, fell into the deep slow-flowing water of the river.

The lizard waddled forward, snapped up the fallen hat of the girl, dropped it, and tumbled himself into the stream.

At the same instant the form of a young man clad in flannels plunged into the river from the

opposite side of the division wall against which the girl had been sitting. He rose and struck back through the sluggish water to the bank with the head of the girl resting on his shoulder. This time she was in no half-conscious state; this time every trace of consciousness had left her. The young man gained the slip in his own grounds, and slowly and carefully carried her up the bank. Here he shifted his burden, to make it more convenient. He did not call out for help. He never felt less need of help in all his life. He never before felt so proud of his broad shoulders as when he rested her head on one of them. He never felt so proud of his strength as when he shook his head, and stepped forward towards the house, disdaining to own to himself that he bore any burden at all. He could walk thus to the end of the world, the burden helping, not hindering.

When he arrived at the door, his part was done, and he called for assistance. Mary and Kate and Lilian were instantly in attendance on the inanimate girl; and presently his widowed mother appeared, a stately and gracious lady of middle age. To them George briefly explained what had occurred. The girl was carried upstairs; and when she was safe in a room, with all four women busy around her, George stole out into the grounds for a walk and a smoke, to quiet him, and for solitude, in which to build a romance all to himself around his beautiful neighbour and his two adventures with her that day—the very first day of her sojourn at Garwood House. It was plain to George that these two adventures could not be mere accident. Fate must mean something by them. What did fate mean? Well, let time tell, and for the present let him dwell in memory on the girl's enchanting beauty.

He had been close to the wall on their side when he heard her scream and saw her fall into the river. He had caught a glimpse of her face as she fell, and he was certain she had fainted before she touched the water. What a lucky fellow he was to have been on the spot! What a lucky fellow he was to have her head lying on his shoulder as he carried her up to the house! He must go back to the house now, to see how she was getting on, and he must then run round to Garwood to tell them she was safe.

Miss Morton had recovered consciousness and was doing well. Mary, his eldest sister, gave him the news; and he said he should call at Garwood to tell them of the accident, and that the girl was safe.

'It was the sight of your wretched Jacko that made the poor girl stumble into the river,' said Mary indignantly. 'I always knew that creature would do some dreadful mischief.'

'Ah,' said George, 'I thought I heard a second splash. He didn't hurt her?'

'No; but we cannot thank you for that. I am delighted the abominable reptile is drowned.'

'Some kinds of crocodiles take a lot of drowning. I'm off to see the one next door. All the water in the ocean wouldn't drown him, if the hangman is to have his due.'

Young Chaytor reached Garwood House just as the Colonel, impetuous with apprehension, entered the drawing-room holding Nellie's hat in his hand.

Young Chaytor said to the servant, whom he met at the back door, a few yards from the

window-door through which Colonel Pickering had just passed into the drawing-room: 'I want to see Mrs Bathurst at once, please, about Miss Morton.'

They had no callers at Garwood House; and the servant was quite unprepared for the apparition of a young man in dripping flannels boldly demanding to see the lady of the house. She was a little thrown off her balance by the unexpected demand of this young man. As, however, he was a next-door neighbour—seemed to have something important to say—and mentioned Miss Morton's name, she thought she might safely take in his message, in spite of general orders against communications being brought into that house from the outside world. She had no notion there was any reason to be uneasy about Nellie, for she had not heard the Colonel's words at the drawing-room door. Upon reaching the drawing-room, she spoke her message so that Mrs Bathurst, William Bathurst, and the Colonel could hear.

'A gentleman about Miss Morton!' cried the Colonel. 'Show him in at once.' In his excitement, he forgot he was not the person to whom the message was addressed or the one to give orders in that house. The servant retired.

Mrs Bathurst was seated on the couch. She had not recovered from the emotions which had just stormed through her nature and broken out into a wild, abject revelation of her blind love for her unhandsome son. She could not trust herself to speak. She had not strength enough to move. She leant against the back of the sofa. Her eyes were half closed and lack-lustre, as if she dozed. She had a terrible feeling that she was losing correct appreciation of her surroundings.

William Bathurst had taken a chair close to the sofa, and sat with head dropped on breast and mouth open, breathing heavily, like one who has climbed a steep quickly.

The Colonel, who had taken a few quick paces up and down the room, turned round and faced the door, holding the girl's hat still in his hand as young Chaytor entered.

'I am Miss Morton's uncle,' said the Colonel, without giving time for any one else to speak. 'Where is she, and what has happened to her?' He held out the torn hat, to give emphasis and point to the question.

'Miss Morton fell into the river accidentally. She was got out, and is now in our place next door quite safe. I assure you she is perfectly unhurt. Of course she got wet.'

'And you, sir, are wet too. Perhaps I ought to have begun by thanking you for her safety?' said the Colonel, advancing to the young man and holding out his hand.

Chaytor took the outstretched hand and bowed in admission and acknowledgment. 'I happened to be near the bank on our side of the wall when the accident happened.'

'And you jumped in and saved her? I wish her aunt were here to thank you.'

'Miss Morton is at our place, the Osiers, next door. Perhaps *you*, sir, would like to see her?' he said, laying a light but significant emphasis on the *you*.

'Pray, lead on, sir; and take my word for it, that you never did a better day's work in your life than when you pulled our Nellie out of the river, and you may count on my gratitude

in great or small things while I live.—I beg your pardon,' said he, suddenly turning, becoming mindful of the presence of the mother and son. 'I am afraid you must fancy me very rude. But I could only think of our dear girl. I will come back to you when I have seen her.' And following young Chaytor, he went out of the room, the two leaving the house by the front door.

As Chaytor and the Colonel went round to the Osiers, the elder man said: 'Nothing could be much more unfortunate than the business on which I came out here. I have been quartered in Deighton. My regiment is on its way to India. I am due at Portsmouth to-night at the very latest, or rather first thing to-morrow morning. I bade good-bye to my niece at Bathurst's to-day, went to my club, and found a telegram from Brazil, forwarded from Deighton, saying the girl's father is dead. They didn't know anything about it, the death, at Garwood until I told them—that is, until I told Mrs Bathurst—her son was not at home when I arrived. I am one of the executors and trustees. Her father intended coming back for good in the autumn. It is very sad, awfully sad, for the poor child. I do wish I wasn't going away just now, and such a distance too! It really is most unfortunate that I should be. I suppose I could obtain permission to join at Suez; or, under the distressing circumstances, I might get leave if I applied for it. But of course I shouldn't like to apply just now, with the regiment on the way, and after being so long at home too. But surely these are urgent private affairs, if ever there were urgent private affairs. I never saw Mrs Bathurst until to-day, and never saw Mr Bathurst until just now. What an extraordinary-looking pair they are! Do you know them very well?

'I do not know them at all. I never was in Garwood House till to-day, or spoke to either of them until this afternoon. Indeed, I never spoke to them at all. You saw our only meeting.'

'And your family are not friendly with them?'

'No one in our house ever spoke to either mother or son.'

'I wasn't favourably impressed with Mrs Bathurst; and the son is positively revolting. I do not care much about leaving our girl in that woman's charge. Had I seen them, I would never have consented to the arrangement. You see, my niece was to stay with them only a short time, only until her father came home, and now the poor fellow is gone. I don't like leaving our girl in that house.'

'I'd rather leave her in her grave.'

'Would you? By George, that's strong. But I think you're right. No; I will not leave her with them. They would be the death of her.'

'Or they would drive her mad,' said young Chaytor; and then he told Colonel Pickering all about the son's nickname, his strange paroxysms of midnight laughter, and the chill mystery and seclusion in which that house lay.

'I am very glad to hear all this from you,' said the Colonel as they entered the door of the Osiers; 'and you are quite right in saying it would be better to leave the girl in her grave than in Garwood.'

George introduced the Colonel to his mother,

who led him to the room where Nellie lay. On the way up-stairs he resolved to say nothing about the death of Christopher Morton just now.

When Nellie saw him she uttered a cry of relief and joy, and stretched out her hands to him, crying, as they were left alone. 'Oh uncle, uncle, this is too good to be true! Now I feel safe once more. You will not leave me! You will not ask me to go back to that awful house—to those awful people! I do not care what becomes of me, so that you do not ask me to go back there. I would rather go into the river. I did think of doing that, but I fell in by accident. You will not, dear, dear uncle, let me go back again!'

'Never! Not for the crown jewels of England, my dearest child, would I let you enter that place again. I'll telegraph for your aunt to come back to town from Portsmouth, and I'll apply for leave on urgent private affairs.'

'But you don't know all. It would be unreasonable of me to object so much for mere whim or disliking; but that monster is a villain, a thief, I think. Oh, my dear uncle, you do not know what dreadful people they are.'

The girl sat up in the bed, pale and trembling, and recounted the scene in the dining-room.

As Colonel Pickering listened to the girl's story of that afternoon, he first grew crimson with rage, then pale with resentment, and when she finished, he walked dumbly up and down the room. At last he spoke in collected and firm tones: 'This is the most atrocious conspiracy that ever came close to me in all my life; and if there is justice to be got in England I'll have it against that infamous pair.'

'Oh uncle, don't do anything against them, but keep me away from them! Do not let them come near me. I never was afraid in all my life before; but now I am terrified.'

'I must leave you in Mrs Chaytor's charge, while I run back to town to see what can be done and how I am to manage all. Do not be in the least uneasy, my dear child. You will be as safe here as you would be in the Tower.'

This was not the time to tell the poor girl of her father's death. She was at once too excited and too prostrated for more news of a distressing character. She had been looking forward to her father's return with great happiness. Of late years she had seen so little of him that his person could be to her little more than a vague memory. But the desolation of her present state of mind would be injuriously increased if she heard just now that she must relinquish all hope of ever seeing that shadowy, far-away father again. Nellie in her distress had not asked him why he had come back after leave-taking. No doubt she thought accident or some trivial matter had brought him. When he was gone to town there would be talk at the Osiers of his visit. That would be the time to tell her of her loss.

Before setting out for town he confided to Mrs Chaytor the object of his second visit that day, and asked the widow to bide her opportunity for telling the sad news to Nellie.

'Just think,' said the Colonel to himself as he found himself in the train for London, 'of the villainy of those people in Garwood planning the robbery and marriage of the dearest girl in the world over her father's open grave! Hanging

would be too good for the hideous monster and the old witch.'

When he reached London, it was too late that day to make sure of the leave; but from what he was told, he felt there would be no doubt about his getting it to-morrow before the ship sailed, as the case was a most peculiar and important one, the circumstances admitting of no delay. So off he went to Portsmouth that night, having telegraphed Nellie that he hoped to be back at the Osiers next day.

And next day he was back with two months' leave. One of the first things he did was to go to his own solicitor and tell him all he knew; whereupon that solicitor wrote a brief note to William Bathurst, Esq., of Garwood House. From that day to this Colonel Pickering's solicitor has never got a reply to the note; and he says, when talking of the affair, that no doubt, in the hurry of Mr Bathurst's sudden journey from England to Mexico with his mother, he quite forgot to reply. But as Bathurst had borrowed the money that fatal Monday on forged signatures, Nellie did not lose the fortune laid by for her.

As the time approached for the Colonel's departure for India, the question once more presented itself as to how he was to provide for the charge of his niece during his absence. But this was settled one day promptly by George telling the Colonel that, there being no objection from him as her guardian, Nellie had promised to be his wife.

The Colonel told the young man that, having saved the girl's life directly and her fortune indirectly, no one else could have so good a claim on her; and as he, George, was a decent fellow, and there appeared to be nothing unsuitable in the match, he didn't know why Nellie's aunt should not see her niece married before leaving home.

So the young people were married the day the Colonel and his wife sailed, that there might be only one parting. And the two women wept as only women can when there is at once a wedding and a long separation at hand; and the two men shook hands distressingly often to keep themselves from—well, to keep themselves employed.

'I never thought,' said the Colonel, by way of good-bye and benison, 'that there could be such a happy ending to my leave when I applied for it that Monday on urgent private affairs.'

THE MONTH:

SCIENCE AND ARTS.

ONE of the most important Exhibitions which have yet been held was opened at the Crystal Palace, Sydenham, last month. Electricity has now become such a useful help in every branch of science and art, to say nothing of its aid as a means of communication between persons and nations, that it is more or less familiar to all. But this familiarity is coupled with much ignorance concerning the magic power which does so much in ministering to our daily needs. The Electrical Exhibition at Sydenham will therefore do good work in bringing before the public not

only the various parts which the strange power can fill in supplying us with light, heat, &c., but also in showing them how the power is generated and controlled. The Exhibition comes at an opportune time, for the large cities are at last waking up from their lethargy, and are springing into light, the said light being due to the electric current.

A walk at night through the streets of London now reveals the fact that gas is giving way to electricity as an illuminant. In many of the larger thoroughfares the gas lamps are unlighted, and have been replaced by electric globes placed on standards about thirty feet high. Truth to tell, the lighting is disappointing; and when the brilliantly illuminated shops close their shutters there is an air of darkness and desolation about the streets, more particularly at those points which are midway between two of the new lamps. We ascribe this fault to two causes. The one is the murky atmosphere of London, which is well known to be less pervious to electric rays than it is to gas; and the other is the employment of semi-opaque glass for the electric light globes, which shuts off about half the light at its very source. The first cause is unhappily without a remedy; but the use of globes which stop so much of the light could be and should be at once discontinued.

Mr C. E. Stretton, a well-known authority upon all that pertains to railways, has recently published some interesting notes as to the standard gauge or measurement between the metals adopted by most iron roads. An excuse for reference to this matter is afforded by the action of the Great Western Railway in relinquishing the last section of their broad-gauge system, which they have lately done in favour of the narrow gauge long ago adopted by the other companies. This standard gauge was suggested by George Stephenson, and has a measurement of four feet eight and a half inches between the metals. 'Why an odd number of inches, why not make it four and a half or five feet at once?' many will naturally exclaim. It came about in this way. Two and a half centuries ago there existed at Newcastle-on-Tyne a wooden way for the accommodation of coal-carts, and this consisted of two planks laid on a wooden bed, the distance from the outside edge of which was five feet. George Stephenson adopted the same gauge as being a convenient one; but the flange of the modern wheel touches the inside, not the outside of the rail. We therefore take as the gauge the distance between the inner edges of the two rails. Each rail is one and three-quarters of an inch in breadth, and the three and a half inches thus added to the gauge measurement already quoted makes five feet.

An interesting paper on Photographing Lightning Flashes, with the apt title 'Jove's Autograph,' was read before the Franklin Institute, in November last, by Mr W. N. Jennings, and

the photographs used as illustrations have since been published in the Journal of the Institute. The first picture is a conventional zigzag of light which was adopted by many generations of artists as a true representation of the lightning flash. That the conventional form is very different from the real thing is easily seen by comparing it with the photographs. These show various types of lightning flash, some being very curious indeed. Here we have the tree-form with ramified branches discharged over half the sky. In another picture a single sinuous line of light stretches from side to side, a veritable horizontal discharge; in another, the lightning seems to have tangled itself into a number of loops and knots, and looks like a skein of white silk fresh from the caresses of a playful kitten. Artists do not paint lightning so often as they did in past times, when the portrayal of historical and classical subjects used to tempt their pencils; but should the old fashion return, painters may have to take a lesson in lightning portraiture from photography. They will not of course be confined to the imitation of it; for the artist must paint things as they appear to the human eye, not necessarily as they appear to an instantaneous photographic lens.

A curious action upon brickwork in chimneys, due to the employment of wood as fuel, has recently been reported upon, the effects being noticeable more especially in American lumber districts, where wood is naturally the staple fuel. The combustion of the wood gives rise to a soot which is impregnated with pyroligneous acid (impure vinegar), and this acid, which in cases of slow combustion is produced in large quantities, dissolves the lime in the mortar which binds the bricks together. In many cases, it is ascertained, the top courses in brick chimneys have in the course of a couple of years been completely denuded of lime, so that the original mortar is represented only by its other constituent, sand.

An example is afforded of the injustice worked by the McKinlay tariff upon men of science, even though they belong to the States, by a story recently published in a New York paper. A Professor attached to one of the academies brought with him from Europe a microscope to aid him in his studies. On arrival at Boston, a heavy duty upon his instrument was demanded, and that demand was only relaxed on the Professor undertaking to make a free gift of the microscope to the school with which he was connected. Further, the Principal of the establishment was subsequently required to take an oath that the instrument had been delivered as a free gift for the sole use of the school, and that it was to be neither sold nor given away.

An American inventor named Beals is said to have produced a type-setting machine which is practical, and which will do the work of twenty compositors. The invention covers two separate machines. The first has the aspect of an ordinary typewriter worked with keys, but the depression of a key instead of printing a letter makes a perforation in a travelling paper tape, the distance of that perforation from a base line being different for every letter. The strip of paper is now transferred to the other machine, which works automatically. The perforated strip passes across a number of projections, each one capable of

making electrical contact through a perforation, this contact causing an electro-magnet to attract the particular type with which the perforation is associated. The types arrange themselves into lines, and are then moulded ready for stereotyping.

Mr Thomas Fletcher of Warrington has called our attention to the frequent bringing forward by ignorant inventors of schemes for getting rid of snow in our streets by melting it by the heat of gas. He points out that such a project is bound to end in failure, for the heating capacity of a cubic foot of gas has long ago been determined, and to show the futility of such a scheme is merely a matter of arithmetic. Supposing that appliances could be designed by which the work could be done effectually—a most improbable assumption—it can be demonstrated that the cost of melting a six-inch fall of snow on one mile of roadway twenty feet wide would be, with gas at three shillings per thousand feet, close upon forty pounds sterling. Unless, too, some means were adopted to warm the surface of the ground somewhat above freezing-point, the melted snow would leave a shining coat of ice, which would be far more dangerous to traffic than the soft covering which it had cost so much to remove.

We are glad to see that the important question of electric communication between our light-houses and the adjacent coasts is once more coming to the front. This question has in the past been much neglected, partly because it is one which does not come directly under the control of any particular government department, and partly because those vitally interested in the matter, our brave sailors and fishermen, are not very well represented in parliament. Other nations have long ago seen the necessity of establishing such communications, and ever since the lamentable wreck of the *Schiller* at the Scilly Isles in 1875 the system has been strongly advocated by influential men. It is to be hoped that something will be done before another such terrible wreck and loss of life urges the matter upon the attention of parliament.

The latest application of the penny-in-the-slot principle is represented in Paris by the automatic distributor of beverages. The apparatus, which dispenses all things drinkable from Malaga wine to hot coffee, may now be seen in many public places in the French metropolis, and is well patronised by the public. It is certain that such a system would meet with extensive patronage in this country upon certain conditions. The first of these would be, that the coffee should be fit to drink, which it very frequently is not in many places where it is sold to the public.

Among the exhibits at the coming 'world's fair' at Chicago will be one illustrating, by means of specimens, the mineral resources of Britain. A collection is now being formed with this view; and at the close of the Exhibition it will not be returned to this country, but will be presented to one of the American Museums.

According to good old custom, Mr Henry Ffennell has recently contributed to the *Times* a detailed account of the salmon-fisheries of Great Britain during the past year. It would seem from this lucid history that the great care which has recently been bestowed upon the breeding

and rearing of fish is now having its effect, for, with few exceptions, all the salmon rivers have been unusually full of fish. As might be expected, poaching has been prevalent, and fly-fishers are complaining of others who are not poachers using baits which are too seductive to the salmon. The past year seems to have been remarkable for the enormous quantity of fish captured, rather than for the phenomenal size of any particular specimens. But we note that among those which found their way to a well-known London fishmonger's, and which were scaled by Mr Ffennell, were three from the Tay, weighing sixty-two pounds, fifty-four pounds, and forty-five pounds respectively.

The occasional poisonous properties of shell-fish, notably mussels, has often been commented upon, and sad instances of illness or even death from eating fish in this condition are not unfrequently reported in the newspapers. Disease from this cause appears in a chronic form in Tierra del Fuego, where mussels are common; and as other kinds of food are rare, the natives often fall victims to poisoning caused by mussel-eating. A doctor attached to the Argentine fleet has studied this question, and has discovered that the mussels are not injurious when at their maximum time of growth, but at other times they become poor and poisonous in quality. He attributes this change to the fact that numbers die off, and the putrefaction of their bodies yields poisonous elements, which are absorbed by the survivors. It will be remembered that some time back a family near Liverpool were poisoned by eating mussels, and the disaster was attributed to the presence of sewage on the shore where the molluscs were gathered. The theory now advanced seems to be a more reasonable one to account for the unfortunate occurrence.

In a recent number of the *Zoologist* a writer complains of the havoc wrought among birds by the action of collectors and so-called naturalists, who with walking-stick guns stalk the country and shoot down every feathered thing which they come across, both in and out of season. In this way the Kentish plover, like the stone curlew, is being rapidly exterminated. It is not only that they kill the birds, but they wound a number of others, which go away to die. Many nests are also trampled down by these marauders, and it is asked why the Wild Birds' Protection Act cannot be put in force against such practices.

An interesting paper was read by Mr F. J. Brodie at a recent meeting of the Meteorological Society, the subject being 'the Prevalence of Fog in London during the past Twenty Years.' From this paper we learn that November is not the most foggy month, as is popularly supposed. December comes first among the months with an average of ten dark days; October averages nine; and November and January have each an average of little more than eight. The fog question, which has such a painful interest for Londoners, is rapidly becoming an important factor in our other large cities.

St Paul's Cathedral is to have a new clock, designed by Lord Grimthorpe, and executed by Messrs John Smith & Sons of Derby. The hours will be struck upon 'Great Paul,' a bell weighing nearly seventeen tons, with a hammer weighing seven hundred pounds. There will be no visible

alteration in the clock dials, except that provision will be made for illuminating them at night. There will be special precision apparatus associated with the clock movement, so that the first stroke of every hour and quarter will be within one second of Greenwich time.

A recent number of the *Agricultural Gazette of New South Wales* contains a very concise and interesting paper on Tea Cultivation, which is intended for the instruction of farmers of that country. The writer, Mr W. T. Robertson, does not advocate tea cultivation in Australia with any hope that an industry can be established to rival that of China, India, and Ceylon; but he believes that it would pay any farmer to grow tea on a more modest scale for his own consumption, and perhaps to supply his neighbours. The labour of children could well be utilised in the lighter portion of the work, and if the owner were under these conditions to place an acre of ground under tea cultivation, it ought to yield him about three hundred pounds of tea per annum.

A correspondent of the *Times* called attention to the fact that the obituary column in that paper on January 19th had no fewer than 159 entries. In only 128 of these was the age of the deceased given, including one infant nineteen days old. If this last little human atom be eliminated, it is found that the average age at which the remaining 127 persons died reaches the extraordinary figure of 70 years 4 months and 21 days. The writer very reasonably questions whether such a longevity has ever before been recorded in any daily paper in the world.

Some experiments have recently been carried out in the United States by Professor Leeds and Dr Davis with a view to test the value of sterilised milk. As a result of these experiments, it is stated that milk so treated, although useful in certain affections of the stomach, is insufficient to sustain life. By raising the temperature of the milk to the boiling-point, matter which was before soluble becomes insoluble, and therefore the liquid is less perfectly digestible than raw milk. But milk can be sterilised without altering its digestive properties by very simple means. It is first made slightly alkaline by the addition of lime-water, and is then heated to one hundred and fifty-five degrees Fahrenheit for six minutes.

Laboratory workers are complaining that the government, by the recent addition of mineral naphtha to methylated spirits, in order to make it too nauseous to be used by inebriates, have rendered it useless for many purposes for which it was formerly employed. Sad to say, the addition will not prevent it being consumed by confirmed toppers, who have been known to drink both naphtha and paraffin when other fiery liquids were unattainable. In Germany the end is gained by adding to the spirit a few drops of Dippel's animal oil, a product from bones, which gives the liquid such an utterly loathsome smell and taste that the most depraved will shrink from it.

'Electricity in Relation to Mining' formed the subject of an important paper recently read before the Institution of Engineers and Shipbuilders in Scotland by Mr Ernest Scott. There are at present about fifty mines in the United Kingdom which are supplied with appliances by which

power can be conveyed below ground by means of wires. Thus many mines which before have been commercially unworkable by reason of their great depth, can now be profitably worked. The reader of the paper claimed the following advantages for electric power over steam, water, or compressed air: Greater efficiency; reduced first cost; greater ease in keeping copper conductors in order, as compared with piping, especially when falling roofs or shifting floors are in question; and the facility with which machines can be moved from place to place, when only wires have to be attached to them. This refers to pumps and coal-cutters principally, which can be advanced along the roadways, or taken on wheels from one part of the workings to another.

That plague of Egypt by which the waters were turned into blood has lately been repeated in a remarkable manner in Sydney Harbour, where the waters suddenly assumed a crimson hue. This was due to the rapid development of a microscopic organism, which not only destroyed all the bivalves within its reach, but also affected the shore animals. The oysters especially suffered, and it is believed that some such rapid development of an injurious microbe may in other cases have caused a sudden dearth of these valued bivalves in districts where once they were numerous.

An ingenious method of teaching the names and relative values of the notes and other characters used in music has lately been patented. It is called the 'Kinderfreund,' and is an application of the principle which has been recognised in the system of object lessons. It consists of a model musical staff of large size upon a stiff varnished board, with a supply of differently-coloured models of each musical character—semi-breves, minims, crotchets, quavers, as well as sharps, flats, rests, &c. These can be arranged in every possible combination upon the model staff; and what may be very appropriately called a musical game may be played, while the pupil is at the same time acquiring familiarity with the names and values of the symbols employed. The various objects which make up the apparatus being treated in bright colours, are attractive to children, who will no doubt find it a useful guide through a somewhat intricate study. The inventor, whose rights are protected by patent, is Miss B. E. MacDonald, Burntisland.

UNDER THE SOUTH WALL.

THE Christmas roses had shed their last snowy petals, and the graceful glossy leaves lost their dark-green richness of colour, hanging limp and brown under the influence of the keen easterly winds that have prevailed since New-year's Day. All the month of November, and far on in December of that year, the pure loveliness of these blossoms had lighted up the warm border under the south wall of the old granary; a deep-buttressed stone wall, covered with gray and brown and saffron-hued lichens, and a small-leaved, white-veined ivy. Ten days before Christmas, from this long, warm, sheltered border were gathered yellow dahlias, brown and golden marigolds, dark red and white chrysanthemums, blue corncockles,

yellow jessamine, white and yellow marguerites, pale pink monthly roses, and several lovely half-blown *Maréchal Niels*, besides a big sheaf of *mignonette* and late purple violets, whose perfume was deliciously sweet.

The autumn had been fine and sunny, and the early winter days free from sharp frosts and rough winds, and the south border is so sheltered from wild weather, that from the necessary clearance of garden rubbish, six weeks barely pass before the hardy spring bulbs begin to show their tender spikes of green from under the dark porous earth, that has been rendered soft by the melted snow. The brown line of earth along the thick old wall has grown broader each day, as the faint misty sunlight glints across the leafless hedge.

A quickening life from the earth's heart has burst,
As it has ever done, with change and motion,
From the great morning of the world! when first
God dawned on chaos.

Turn up the moist mould gently, and all the roots will be found instinct with life. As the sleeping flowers begin to feel the life-giving south wind, the fine thread-like rootlets spread out, and seek the rich nourishment found in the soil; the bulbs swell, and shoot out the shining white points, that in a few days will develop into leaves and flowers; even now, the cone-shaped points that will become blossoms are distinguished from the sharper ones that will bring forth leaves.

There is a faint undefinable whisper of spring in the air, though the hollow murmur of stormy winds is still heard in the leafless trees; and the sound of rushing waters in the flooded brooks reveals the hidden secrets of the rain and melted snow. What a restful fascination there is in the ever-varying Book of Nature! Weary we may be with the work of the world, heart-sick with sight of trouble; yet we see even the black and bitter days of hard frost and whirling snow are but a needful preparation for the future beauty and peace.

The brown and withered clumps of bracken on the hill-side cover the tender fronds for the next season; the crisp, gray lichens on the wall protect the green softness underneath; the brown bulbs sleep in the ground; and the strong ramifying roots of the forest trees strike deeper into the earth, growing silently underground, and only waiting to feel the mysterious influence of the Gulf-stream, when the sap will rise, full of luscious nourishment, causing the bark to expand, and the tiny leaf-cones swell and glisten with renewed life and vigour. Just a bare two months of the mystery of winter, and we find, imperceptibly the gray dawn has crept in an hour earlier; the blinds are not drawn so soon in the evening; the robin's plaintive notes are heard later in the short twilight and in fuller music; and some morning, the first broken song of the Norman thrush greets the pale watery sunshine from the top of the big leafless elms, that gleams

dimly for ten minutes or so once or twice during the morning hours, from the clinging mists that drift about slowly, and once a patch of azure shines through a rift in the low-hanging clouds. It lightens the heart, and the day never seems quite so long or dull afterwards; for it tells that far off—but still there—hidden in spreading vapours, abides the glorious life-giving sun.

Nature is never altogether at rest, or idle; for while the broad fields of the world are still brown and bare of herbage, and the trees lifeless, there are south borders where can be found goodly rows of snowdrops in bud and blossom, and bright gleams of amber and white and purple in the bunches of crocuses. 'Under the brown of last year's leaves' are pink and blue hepaticas, fast showing bloom; the gay little tom-tits come to the old lichen wall, clinging to the ivy, and pecking out daintily every insect that ventures into the sunshine. From the crevices creep the bright-coloured beetles and bask on the warm dry earth; or a big spotted spider crawls warily about and investigates the premises, and should the weather appear favourable, will have stretched his web by the morning. The sweet white violets will soon scent the sunny air along the south wall, and the pink clusters of mezereon show their almond-scented blossoms. Then for a few days will come an interregnum, when the snow will cover up the south border warmly for a short space of time, while the howling March winds sweep the drifting storm-clouds fiercely over the vault of heaven, intent on their merciful message of purifying the earth of dank unwholesome vapours, and clearing the atmosphere of smoke and fog, and making sharp and distinct in the distance the blue line of the 'everlasting hills,' that stretch away for miles in wooded slopes and swelling uplands.

In a short time the woods will have a faint purple brown tinge, and the hills, now so gray and bare, will show long undulating lines of young wheat and barley, as the earth opens her pores for the outspring of vegetation. Under the hardy shrubs and laurels the golden aconite will blow, and that 'sunflower of Spring,' the dandelion, will open its cheerful face to the sun, and the bright-rayed coltsfoot expand its yellow petals above ground long before the light downy leaves show themselves to the light of day.

Round the warm comfortable hives the bees are getting restless, creeping in and out of the openings and making short gyrations, to stretch their wings after the long hibernation.

How delicious, after a tedious illness, to walk under the south wall and draw long breaths of the sweet fresh air, so eagerly longed for during days of prostrating pain—to feel the warm sunshine, and see the exuberant health and life of the young children, and hear the cheerful bustle of business life stirring in the streets, that are not a stone's-throw away from us. The very puff and whistle of the engine, and shunting of trains in the distant station, have a cheering influence upon the mind, and the invalid returns refreshed and invigorated with brighter eyes and quieter mind.

SPRING.

A DITTY FOR ST VALENTINE'S DAY.

ALL Hail! For the sun, like a giant, is rending
The clouds that seemed hung like a dark pall on
high;
Bright beams chase each other, in radiance descending,
Now kiss the cold earth, whisp'ring, 'Summer is
nigh.'

The young leaves are longing to burst from their
swathing,
And shine in the pride of their fresh tender green;
The meadows rejoice that now they are bathing
In sunshine that not for long months have they seen.

The valley's pure lilies their joy-bells are ringing
The tune that the flowerets of old have known well;
It tells of the glories the sunshine is bringing
O'er garden and hedgerow, o'er hillock and dell.

Pearl pendants the snowdrops are freely displaying,
While crocuses hold up their vases of gold,
And clust'ring violets their presence betraying,
Have hastened to peep now above the dark mould.

The rose-roots are busy their odours distilling,
To hive in soft cups, or to freely bestow;
The song-birds are tuning, and piping, and trilling
To tell of the music that summer shall know.

And the seeds, that for weeks have been silently
swelling,
Thank that ploughman, the earthworm, who delves
in the dark,
For loosening the soil, its own proper dwelling,
In cornfields and garden, in meadow and park.

The rooks in a fluster hold parliament meetings
To settle the weighty affairs of their race,
Or caw out their wrath, or perchance friendly greetings,
Their wrath if wrongdoers away they must chase.

Oh, let us rejoice in the sweet olden story
That earth is the Hebe eternally young,
For winter was only a mask for her glory,
That theme of which poets have constantly sung.

Ah, the longer we live the more are we learning
The Hand of the Ruler to trace everywhere;
And the rapture we feel at spring-tide returning
In renewal of youth shows that we have a share!

CAMILLA CROSLAND.

OUR COAST LIFE-SAVING SERVICES : ARE THEY SUFFICIENT?

THE year 1891 will long be remembered for the severity of the weather experienced on the British coasts. Gale succeeded gale with relentless persistency, and the maritime disasters caused by them taxed all our available life-saving machinery to the utmost. The three opening and the three closing months of the year were especially fertile in casualties. How terrible the March storms were, the simple statement that no fewer than fifty-three lives were lost within the space of two hours in close proximity to the Start, bears eloquent witness; and the fate of the *Ben Venue* and *Enterkin* affords ample testimony to the awful weather of the last three months of the year that is gone.

A shipwreck is always a lamentable catastrophe; but when it occurs on the very threshold of home, after a vessel has successfully combated the storms and perils of a lengthy voyage, it is doubly distressing. Future chroniclers of maritime disasters will ever assign a prominent place to the loss of the *Bay of Panama*. The story of this wreck is too well known to need any but the briefest allusion. Homeward bound from a long voyage, the fine four-master was beating up the English Channel, when the terrible 'March' blizzard came on, and she was unable, by reason of the fierce south-east gale, to avoid the outlying rock-reefs that fringe the Cornish coast. The frantic efforts of the brave natives to bring the aid of the coastguard into requisition—the gallant rescue of a portion of the crew by the rocket apparatus—the awful sight of a noble ship, dimly visible through the blinding snow and spray, lying helpless within a stone's-throw from the beach—the irresistible wind, driving before it the cruel seas that swept the spent and frozen mariners one by one from the vessel's deck, will long live in the memory of the inhabitants of the hamlets that lie adjacent to the cove where the disaster occurred.

There is no need to multiply instances. The cases we have mentioned are quite sufficient for the purpose. Their lamentable life-loss affords ample reason for bringing into review the whole of the Life-saving Services available for the succour of the shipwrecked. Altogether about six or seven hundred lives are lost off the British coasts each year, and this loss of life is greatly in excess of what it should be. Great Britain's maritime supremacy is undoubted; but her life-saving machinery is vastly inferior to the requirements of the case, and very much behind that of other countries whose commercial importance is insignificant when compared with ours. During the year ended June 30, 1890, the number of vessels lost or damaged on the coasts of the British Islands, or in the seas immediately adjacent to them, was 4334, and the loss of life so far as can be ascertained was 406. This takes no cognisance of other life-loss than that resulting from shipwreck. The total number of lives lost during the past thirty years reaches no fewer a total than 25,265, an enormous number to be sacrificed at our very doors. The number of lives saved from wrecked vessels during the same period was 25,541—so that the number saved exceeds the number lost by 276.

Now, what are the means at hand to provide for the safety of the 4000 vessels that yearly meet with disaster off our coasts? First, there are the boats of the Royal National Lifeboat Institution, an organisation which reflects the highest credit upon the British public, the officials of the Society, and the brave crews who risk their lives in the noble work. This is the chief life-saving means. There are other lifeboats; but the Lifeboat Institution is responsible for the equipment and maintenance of the vast majority of the lifeboats around our coasts. There are 303 rocket stations whose equipment is furnished by the Board of Trade. In assessing the available life-saving means, it must not be lost sight of that the fishermen and boatmen attracted to the scene of a disaster can always be relied upon to give valuable assistance to the cause of life-saving. These

are the principal means of succour for the shipwrecked; but they are deplorably short of the needs of Great Britain's mercantile marine.

A short consideration of the facts of the case will readily show wherein this deficiency originates, and the best means for its removal. It must be confessed, however, that it is somewhat of an invidious task to hint at shortcomings in such a glorious and time-honoured institution as the Royal National Lifeboat Institution. No blame, however, attaches to it. The term voluntary has no higher signification than when applied to a life-saving service. But, unfortunately, poverty is too often a chronic complaint of 'voluntary' institutions. Certainly, the Royal Lifeboat Institution is not exempt from the disease, and is, in consequence, compelled to draw upon her capital for support. Depreciation fund there is none, and past experience shows that it is practically impossible to raise one. The purses that are opened wide when a thrilling shipwreck or awful lifeboat disaster makes a heart-stirring appeal, are closed to the more prosaic request for funds to carry out repairs rendered necessary by commonplace wear and tear. The Government are quite content to relegate the life-saving business to other hands than their own, and to look on while the members of the Lifeboat Institution strive to the utmost to attract a supply of funds adequate to the needs of the shipwrecked.

The lifeboat charities have other and powerful competitors in the field of public sympathy. Statistics show that colliery disasters or foreign famines have frequently caused a diminution in the life-saving subscriptions. This will ever be so. The public liberality always was and always will be an inconstant quantity. Its vagaries are well known, and are beyond control. Appeals have lately been made throughout the length and breadth of the land in aid of the funds of the Royal Lifeboat Society. The hearty response that the appeal has met with is shown by the fact that the editor of the *Yorkshire Post* collected £3500 within the short space of three weeks; and at Manchester, where over £5000 was raised, £600 was collected in coppers from the streets! This is very gratifying; but the question will of necessity suggest itself: What happens when the public bounty is withheld? Who suffers? The answer is, the shipwrecked.

As we have pointed out, the Royal Lifeboat Institution is the *main* life-saving force. Contract its sphere of usefulness by a diminution of financial support, and the area of suffering and misery consequent upon loss of life among our seamen is increased in the same proportion. British seamen surely deserve better of the nation than that their safety should be left to the vagaries of public charity. Yet the State, because there is no available fund which may be devoted to the purposes of life-saving, are content to let matters go on as in the past, rather than take upon themselves the responsibility of creating such a fund.

We have already mentioned the deplorable life-loss that marked the path of the blizzard of March 1891. The southern shore of England was then literally strewn with wreckage. Each projecting headland on the coast of Devon and Cornwall was the scene of a maritime disaster

whose awfulness varied in proportion to the loss of life involved. Besides, the lack of complete organisation between the different life-saving machinery was made painfully manifest. Lighthouse and lightship keepers gazed on vessels drifting helplessly to destruction, and were powerless to aid—unable even to communicate the news to the nearest coastguard or lifeboat station.

This storm materially strengthened the case which the Associated Chambers of Commerce had to lay before the President of the Board of Trade in June. The annual meeting of the Chambers was held early in March, and then it was resolved to leave no stone unturned to secure telegraphic communication between lighthouse or lightship and the shore. The resolution impressed upon Sir Michael Hicks-Beach was to the effect that 'it was most important that, in addition to the coastguard and lifeboat stations, the lightships and lighthouses both on the mainland and on adjacent islands, such as Lundy Island, be placed in telegraphic communication with the general telegraphic system.' The cost of such an undertaking is estimated at £100,000, a small amount when the possibilities of life-saving are considered, and an amount which British shipowners have expressed their willingness to subscribe to. How much more effective would British life-saving services become were the officials apprised from lighthouse or lightship of the exact whereabouts of a distressed vessel. Unfortunately, however, red-tape interferes very materially with this vital reform. The coastguard, whose labours it was proposed to utilise for the purposes of life-saving, are controlled by another department of the Government, and, to quote what the President of the Board of Trade himself said: 'I must ask you to understand that I can really have nothing to do departmentally with the matter so far as it affects the coastguard service. The coastguard are of course under the Admiralty; and any fresh duties to be imposed upon them must be imposed with the consent of the Admiralty and under rules to be made by the Admiralty.'

The deputation and its treatment puts in little compass the main features of the question. The shipowning class agitate for life-saving reforms, the major portion of the expense connected with which would fall upon them; while that department of the Government to which is deputed the task of providing for the safety of the travelling community by land or sea shelve their responsibility, and plead first that they have no funds available for the purpose; and secondly, that the proposed reforms would involve the co-operation of another official department of the State. And so the matter drags on, while storms come, and ships are wrecked, and much valuable life and property are sacrificed by the delay. But why should not the State be held solely and wholly responsible for the administration of an efficient life-saving service and one that shall supply the needs of the mercantile marine? France, Denmark, Scandinavia, Holland, Canada, and the Cape have their lighthouses connected by telegraph or telephone with their general telegraph systems, and their life-saving systems are rendered much more effective in consequence.

In the United States there is a Government life-saving service, and the men engaged in it

are servants of the State, drilled and trained in the art of saving life. Some are lifeboat men; others have for their special work the manipulation of the rocket apparatus; while another section are surfmen practised in rescuing drowning men from the broken water close in shore. In all there are some 225 of these life-saving stations; and the number of disasters that came within their field of operation during the last year for which returns were available was 378; and out of 3016 persons on board the vessels in distress, only 38 lives were lost.

Some such service as this might with advantage be instituted in this country. The direct benefits conferred by it would be very great. The crews that man our lifeboats would be paid by the State, and if they lost their lives in the work of rescue, dependent relatives could with justice expect compensation from the State. The Royal Lifeboat Institution has always afforded handsome assistance in the case of a lifeboat disaster, and the British public has ever responded heartily to an appeal of this class. But the claims of those who lose their lives in the cause of the shipwrecked should not be dependent upon public sympathy alone; the State should, so far as monetary compensation can, repair the loss, and the generosity of the public could afford supplementary testimony of the value of the services rendered, as it chose.

A great defect in the present condition of things is that the different lifeboat stations round the coast are not placed in direct communication with each other. In many cases these stations are very close together, and it frequently happens that more than one lifeboat puts off to the same distressed vessel. Much unnecessary risk is thus run. It will be remembered that on the occasion of the memorable disaster to the Southport lifeboat, when almost the whole crew perished, the wrecked vessel was succoured from an adjacent lifeboat station. At Liverpool this lack of intercommunication is still more marked. The lightships moored in Liverpool Bay signal by means of rockets when they observe any vessel in distress. In the darkness of the night, it is a difficult matter to find a wrecked vessel among the wild masses of broken water that mark the dangerous sandbanks, navigation among which is fraught with so much danger. Yet three lifeboats will sometimes put out in response to the same signals, where, by better management, one lifeboat would suffice. The very presence of a lightship shows the existence of a danger-spot, a locality where vessels are likely to come to grief, and the benefits conferred by connecting them telegraphically with the nearest life-saving stations would be incalculable. Lifeboat crews could then be apprised of the exact locality of a wreck, and less would be heard of crews spending the whole night upon the waters vainly seeking for some reported wreck.

The location of lightships on dangerous coasts suggests the possibility of a reform that was advocated as far back as the year 1875. The ship *Deutschland* was stranded within the view of four lightvessels, the *Kentish Knock*, *Cork*, *Shipwash*, and the *Sunk*—a well-known spot dreaded by mariners making London and caught in bad weather. She lay there for thirty hours before assistance arrived. It was then suggested that

if a life-saving vessel equipped with a lifeboat were moored right in the midst of a dangerous seaway, as lightvessels are, she might often be able to render efficient and prompt assistance. The loss of the *Deutschland* was soon forgotten, and with it the suggestion it had called into being.

Even with a life-saving service as perfect as ample means and scientific foresight can make it, it must not be forgotten that 'self-help' is a principle as efficacious in saving life as in other matters. It frequently happens that the rocket apparatus fails to throw a line over a stranded vessel. A ship, however big, is a difficult mark to hit, for the gale that blows her ashore drives the friendly rocket-stick back to the would-be rescuers. The shore is an easier target, and one readily reached with the aid of the wind blowing from the ship to the shore. It is rarely that a vessel is so broken up on striking that there is not the stump of a mast remaining, to which the life-line can be attached. Many lives might be saved if vessels themselves carried the requisite means of conveying a line to the shore. Insular position has done much to establish the maritime supremacy of Great Britain; but it must not be forgotten that the mere fact of its being an island and possessed of the greatest carrying trade of the world, constitutes a standing source of danger to British seamen.

The labours of these toilers of the sea lay the nation under a deep debt of gratitude. Gratitude alone, to say nothing of humanity, demands that everything possible shall be done to stay the frightful life-waste occurrent on our shores. At present there is much to be done, and it devolves upon the State to supply that which is lacking, and to see that the coasts of Great Britain are equipped with life-saving machinery as complete as human foresight can devise, and worthy of the great mercantile marine which is our boast.

THE IVORY GATE.*

By WALTER BESANT.

CHAPTER VII.—SOMETHING ELSE HAPPENS.

MR DERING lay back in his chair, gazing at the door—the unromantic office door—through which Elsie had just passed. I suppose that even the driest of old bachelors and lawyers may be touched by the sight of a young girl made suddenly and unexpectedly happy. Perhaps the mere apparition of a lovely girl, dainty and delicate and sweet, daintily and delicately appressed, so as to look like a goddess or a wood-nymph rather than a creature of clay, may have awakened old and long-forgotten thoughts before the instincts of youth were stifled by piles of parchment. It is the peculiar and undisputed privilege of the historian to read thoughts, but it is not always necessary to write them down.

He sat up and sighed. 'I have not told her all,' he murmured. 'She shall be happier still.' He touched his hand-bell. 'Checkley,' he said, 'ask Mr Austin kindly to step this way.—A day of surprise—of joyful surprise—for both.'

It was indeed to be a day of good fortune, as you shall see.

* Copyright 1892 in the United States of America by Harper & Brothers.

He opened a drawer and took out a document rolled and tied, which he laid upon the table before him.

George obeyed the summons, not without misgiving, for Elsie, he knew, must by this time have had the dreaded interview, and the call might have some reference to his own share in the great contumacy. To incur the displeasure of his employer in connection with that event might lead to serious consequences.

Astonishing thing! Mr Dering received him with a countenance that seemed transformed. He smiled benevolently upon him. He even laughed. He smiled when George opened the door: he laughed when, in obedience to a gesture of invitation, George took a chair. He actually laughed: not weakly or foolishly, but as a strong man laughs.

'I want ten minutes with you, George Austin'—he actually used the Christian name—'ten minutes or a quarter of an hour, or perhaps half an hour.' He laughed again. 'Now, then'—his face assumed its usual judicial expression, but his lips broke into unaccustomed smiles—'Now then, sir, I have just seen my ward—my former ward, for she is now of age—and have heard—well—everything there was to hear.'

'I have no doubt, sir, that what you heard from Elsie was the exact truth.'

'I believe so. The questions which I put to her I also put to you. How do you propose to live? On your salary? You have been engaged to my late ward without asking the permission of her guardians—that is, her mother and myself.'

'That is not quite the case. We found that her mother opposed the engagement, and therefore it was not necessary to ask your permission. We agreed to let the matter rest until she should be of age. Meanwhile, we openly corresponded and saw each other.'

'It is a distinction without a difference. Perhaps what you would call a legal distinction. You now propose to marry. Elsie Arundel is no longer my ward; but, as a friend, I venture to ask you how you propose to live? A wife and a house cost money. Shall you keep house and wife on your salary alone? Have you any other resources?'

There are several ways of putting these awkward questions. There is especially the way of accusation, by which you charge the guilty young man of being by his own fault one of a very large family—of having no money and no expectations—nothing at all, unless he can make it for himself. It is the manner generally adopted by parents and guardians. Mr Dering, however, when he put the question smiled genially and rubbed his hands—a thing so unusual as to be terrifying in itself—as if he was uttering a joke—a thing he never had done in his life. The question, however, even when put in this, the kindest way, is one most awkward for any young man, and especially to a young man in either branch of the law, and most especially to a young man beginning the ascent of the lower branch.

Consider, of all the professions, crowded as they are, there is none so crowded as this branch of the law. 'What,' asks anxious Quiverful Père, 'shall I do with this boy of mine? I will spend a thousand pounds upon him and make him a solicitor. Once he has passed, the way is clear

for him.' 'How,' asks the ambitious man of trade, 'shall I advance my son? I will make him a lawyer; once passed, he will open an office and get a practice and become rich. He will be a gentleman. And his children will be born gentlemen.' Very good; a most laudable custom it is in this realm of Great Britain for the young men still to be pressing upwards, though those who are already high up would fain forget the days of climbing and sneer at those who are making their way. But, applied to this profession, climbing seems no longer practicable. This way of advance will have to be abandoned.

Consider, again. Every profession gets rich out of its own mine. There is the mine Ecclesiastic, the mine Medical, the mine Artistic, the mine Legal. The last-named contains leases, covenants, agreements, wills, bonds, mortgages, actions, partnerships, transfers, conveyances, county courts, and other treasures, all to be had for the digging. But—and this is too often forgotten—there is only a limited quantity to be taken out of the mine every year, and there is not enough to go round, except in very minute portions. And since, until we become socialists at heart, we shall all of us continue to desire for our share, that which is called the mess of Benjamin, and since all cannot get that mess—which Mr Dering had enjoyed for the whole of his life—or anything like that desirable portion, most young solicitors go in great heaviness of spirit—hang their heads, corrugate their foreheads, write despairing letters to the girls they left behind them, and with grumbling gratitude take the hundred or two hundred a year which is offered for their services as managing clerks. Again, the Legal mine seems of late years not to yield anything like so much as formerly. There has been a cruel shrinkage all over the country, and especially in country towns: the boom of building seems to have come to an end: the agricultural depression has dragged down with it an immense number of people who formerly flourished with the lawyers, and, by means of their savings, investments, leases, and partnerships and quarrels, made many a solicitor fat and happy. That is all gone. It used to be easy, if one had a little money, to buy a partnership. Now it is no longer possible, or, at least, no longer easy. Nobody has a business greater than he himself can manage: everybody has got a son coming in.

These considerations show why the question was difficult to answer.

Said George in reply, but with some confusion: 'We are prepared to live on little. We are not in the least extravagant: Elsie will rough it. Besides, she has her Art'—

'Out of which she makes at present nothing a year.'

'But she will get on—and I may hope, may reasonably hope, some time to make an income larger than my present one.'

'You may hope—you may hope. But the position is not hopeful. In fact, George Austin, you must marry on ten times your present income, or not at all.'

'But I assure you, sir, our ideas are truly modest, and we have made up our minds how we can live and pay our way.'

'You think you have. That is to say you have prepared a table of expenses showing how, with

twopence to spare, you can live very well on two hundred pounds a year. Of course you put down nothing for the thousand-and-one little unexpected things which everybody of your education and habits pays for every day.'

'We have provided as far as we can see.'

'Well, it won't do. Of course, I can't forbid the girl to marry you. She is of age. I can't forbid you—but I can make it impossible—impossible for you, Master Austin—impossible.'

He rapped the table. The words were stern, but the voice was kindly, and he smiled again as he spoke. 'You thought you would do without me, did you? Well—you shall see—you shall see.'

George received this threat without words, but with a red face and with rising indignation. Still, when one is a servant, one must endure the reproofs of the master. He said nothing therefore, but waited.

'I have considered for some time,' Mr Dering continued, 'how to meet this case in a satisfactory manner. At last I made up my mind. And if you will read this document, young gentleman, you will find that I have made your foolish proposal to marry on love and nothing else quite impossible—quite impossible, sir.' He slapped the table with the paper and tossed it over to George.

George took the paper and began to read it. Suddenly he jumped out of his chair. He sprang to his feet. 'What?' he cried.

'Go on—go on,' said Mr Dering benevolently.

'Partnership? Partnership?' George gasped. 'What does it mean?'

'It is, as you say, a Deed of Partnership between myself and yourself. The conditions of the Partnership are duly set forth—I hope you will see your way to accepting them.—A Deed of Partnership. I do not know within a few hundreds what your share may be, but I believe you may reckon on at least two thousand for the first year, and more—much more—before long.'

'More than a thousand?'

'You have not read the deed through. Call yourself a lawyer? Sit down and read it word for word.'

George obeyed, reading it as if it was a paper submitted to him for consideration, a paper belonging to some one else.

'Well? You have read it?'

'Yes; I have read it through.'

'Observe that the Partnership may be dissolved by Death, Bankruptcy, or Mutual Consent. I receive two-thirds of the proceeds for life. That—alas!—will not be for long.—Well, young man, do you accept this offer?'

'Accept? Oh! Accept? What can I do? What can I say—but accept?' He walked to the window and looked out; I suppose he was admiring the trees in the Square, which were certainly very beautiful in early July. Then he returned, his eyes humid.

'Aha!' Mr Dering chuckled. 'I told you that I would make it impossible for you to marry on two hundred pounds a year. I waited till Elsie's birthday. Well? You will now be able to revise that little estimate of living on two hundred a year. Eh?'

'Mr Dering,' said George, with breaking voice,

'I cannot believe it; I cannot understand it. I have not deserved it.'

'Shake hands, my Partner.'

The two men shook hands.

'Now sit down and let us talk a bit,' said Mr Dering. 'I am old. I am past seventy. I have tried to persuade myself that I am still as fit for work as ever. But I have had warnings. I now perceive that they must be taken as warnings. Sometimes it is a little confusion of memory—I am not able to account for little things—I forget what I did yesterday afternoon. I suppose all old men get these reminders of coming decay. It means that I must reduce work and responsibility. I might give up business altogether and retire: I have money enough and to spare: but this is the third generation of a successful House, and I could not bear to close the doors, and to think that the Firm would altogether vanish. So I thought I would take a partner, and I began to look about me. Well—in brief, I came to the conclusion that I should find no young man better qualified than yourself for ability and for power of work and for all the qualities necessary for the successful conduct of such a House as this. Especially I considered the essential of good manners. I was early taught by my father that the greatest aid to success is good breeding. I trust that in this respect I have done justice to the teaching of one who was the most courtly of his time. You belong to an age of less ceremony and less respect to rank. But we are not always in a barrack or in a club. We are not all comrades or equals. There are those below to consider as well as those above. There are women: there are old men: you, my partner, have shown me that you can give to each the consideration, the deference, the recognition that he deserves. True breeding is the recognition of the individual. You are careful of the small things which smooth the asperities of business. In no profession, not even that of medicine, is a good manner more useful than in ours. And this you possess.—It also pleases me,' he added after a pause, 'to think that in making you my partner, I am also promoting the happiness of a young lady I have known all her life.'

George murmured something. He looked more like a guilty schoolboy than a man just raised to a position most enviable. His cheeks were flushed and his hands trembled. Mr Dering touched his bell.

'Checkley,' he said, when that faithful retainer appeared, 'I have already told you of my intention to take a partner. This is my new partner.'

Checkley changed colour. His old eyes—or was George wrong?—flashed with a light of malignity as he raised them. It made him feel uncomfortable—but only for a moment.

'My partner, Checkley,' repeated Mr Dering.

'Oh!' His voice was dry and grating. 'Since we couldn't go on as before— Well, I hope you won't repent it.'

'You shall witness the signing of the Deed, Checkley. Call in a clerk. So—there we have it, drawn, signed, and witnessed. Once more, my partner, shake hands.'

Elsie retired to her own room after the snub administered to her rising spirits. She soon

began to sing again, being much too happy to be affected by anything so small. She went on with her portrait, preserving some, but not all, of the softness and benevolence which she had put into it, and thereby producing what is allowed to be an excellent portrait, but somewhat flattering. She herself knows very well that it is not flattering at all, but even lower than the truth, only the other people have never seen the lawyer in an expansive moment.

Now, while she was thus engaged, her mind going back every other minute to her newly-acquired inheritance, a cab drove up to the house—the door flew open, and her lover—her George—flew into her arms.

'You here—George? Actually in the house? Oh! but you know'—

'I know—I know. But I could not possibly wait till this evening. My dear child, the most wonderful—the most wonderful thing—the most extraordinary thing—in the whole world has happened—a thing we could never hope and never ask'—

'Mr Dering has told you, then?'

'What? Do you know?'

'Mr Dering told me this morning.—Oh George! isn't it wonderful?'

'Wonderful? It is like the last chapter of a novel!' This he said speaking as a Fool, because the only last chapter in life is that in which Azrael crosses the threshold.

'Oh George!—I have been walking in the air—I have been flying—I have been singing and dancing. I feel as if I had never before known what it was to be happy. Mr Dering said something about having it settled—mind—it's all yours, George—yours as well as mine.'

'Yes,' said George, a little puzzled. 'I suppose in the eyes of the law it is mine, but then it is yours as well. All that is mine is yours.'

'Oh! Mr Dering said it was mine in the eyes of the law. What does it matter, George, what the stupid old law says?'

'Nothing, my dear—nothing at all.'

'It will be worth five hundred pounds a year very nearly. That, with your two hundred pounds a year, will make us actually comfortable after all our anxieties.'

'Five hundred a year? It will be worth four times that, I hope.'

'Four times? Oh no!—that is impossible. But Mr Dering told me that he could hardly get so much as four per cent., and I have made a sum and worked it out. Rule for simple interest: multiply the principal by the rate per cent., and again by the time, and divide by a hundred. It is quite simple. And what makes the sum simpler, you need only take one year.'

'What principal, Elsie, by what interest? You are running your little head against rules of arithmetic. Here there is no principal and no interest. It is a case of proceeds, and then division.'

'We will call it proceeds, if you like, George, but he called it interest. Anyhow, it comes to five hundred a year, very nearly; and with your two hundred'—

'I don't know what you mean by your five hundred a year. As for my two hundred, unless I am very much mistaken, that will very soon be two thousand.'

'Your two hundred will become?—George, we are talking across each other.'

'Yes. What money of yours do you mean?'

'I mean the twelve thousand pounds that Mr Dering holds for me—with accumulations—accumulations'—she began to sing the Rhyme of the omnibus wheels—'accumulations—atons—atons.'

'Twelve thousand pounds? Is this fairyland? Twelve thousand?—I reel—I faint—I sink—I melt away. Take my hands—both my hands, Elsie—kiss me kindly—it's better than brandy—kindly kiss me. Twelve thousand pounds! with accumulations'—

'—atons—atons—atons,' she sung. 'Never before, George, have I understood the loveliness and the power of money. They were given to Mr Dering by an anonymous person to be held for me—secretly. No one knows—not even, yet, my mother.'

'Oh! It is altogether too much—too much: once there was a poor but loving couple, and Fortune turned her wheel, and— You don't know—you most unsuspecting ignorant Thing—you can't guess—Oh, Elsie, I am a partner—Mr Dering's partner!'

They caught hands again—then they let go—then they sat down and gazed upon each other.

'Elsie,' said George.

'George,' said Elsie.

'We can now marry like everybody else—but much better. We shall have furniture now.'

'All the furniture we shall want, and a house where we please. No contriving now—no pinching.'

'No self-denying for each other, my dear.'

'That's a pity, isn't it?—But, George, don't repine. The advantages may counterbalance the drawbacks. I think I see the cottage where we were going to live. It is in Islington: or near it—Barnsbury, perhaps: there is a little garden in front, and one at the back. There is always washing hung out to dry. I don't like the smell of suds. For dinner, one has cold Australian tinned meat for economy, not for choice. The rooms are very small, and the furniture is shabby, because it was cheap and bad to begin with. And when you come home—oh George!—she stuck her forefinger in her chalk and drew two or three lines on his face—you look like that, so discontented, so grumpy, so gloomy. Oh, my dear, the advantages—they do so greatly outbalance the drawbacks; and George—you will love your wife all the more—I am sure you will—because she can always dress properly and look nice, and give you a dinner that will help to rest you from the work of the day.'

Once more this foolish couple fell into each other's arms and kissed again with tears and smiles and laughter.

'Who,' asked Mrs Arundel, ringing the bell up-stairs, 'who is with Miss Elsie below?'

On hearing that it was Mr George Austin, whose presence in the house was forbidden, Mrs Arundel rose solemnly and awfully and walked down the stairs. She had a clear duty before her. When she threw open the door, the lovers were hand in hand dancing round the room laughing—but the tears were running down Elsie's cheeks.

'Elsie,' said her mother, standing at the open door, 'perhaps you can explain this.'

'Permit me to explain,' said George.

'This gentleman, Elsie, has been forbidden the house.'

'One moment,' he began.

'Go, sir.' She pointed majestically to the window.

'Oh!' cried Elsie. 'Tell her, George—tell her; I cannot.' She fell to laughing and crying together, but still held her lover by the hand.

'I will have no communication whatever with one who robs me of a daughter,' said this Roman matron. 'Will you once more leave the house, sir?'

'Mother—you *must* hear him.'

'Nothing,' said Mrs Arundel, 'will ever induce me to speak to him—nothing.'

'Mother, don't be silly,' Elsie cried; 'you don't know what has happened. You *must* not say such things. You will only be sorry for them afterwards.'

'Never—never. One may forgive such a man, but one can never speak to him, never—what ever happens—never.' The lady looked almost heroic as she waved her right hand in the direction of the man.

'I will go,' said George, 'but not till you have heard me. I am rich—Elsie is rich—we shall not marry into poverty. The whole situation is entirely changed.'

'Changed,' Elsie repeated, taking George's arm.

'My dear George,' said Mrs Arundel, when she had heard the whole story—and by cross-examination persuaded herself that it was true—'you know on what a just basis my objections were founded. Otherwise, I should have been delighted at the outset.—Kiss me, Elsie.—You have my full consent, children. These remarkable events are Providential.—On Mr Dering's death or retirement, you will step into an enormous practice. Follow his example. Take no partner till old age compels you. Keep all the profits for yourself—all.—My dear George, you should be a very happy man. Not so rich, perhaps, as my son-in-law, Sir Samuel, but above the ordinary run of common happiness. As for the past—We will now go down to lunch.—There is the bell. These emotions are fatiguing.'

SOME COMMON MISTAKES ABOUT WORDS.

FEW subjects possess greater charms, or have had more attention bestowed on them of late years, than the study of language. For the philologist it must always be a source of the highest interest to trace the laws by which whole languages have diverged or disappeared, and the principles which have guided the formation of particular words and expressions. Among the general laws, however, which govern the formation of words, many curious perversions are to be found. Indeed, a whole chapter of the history of every language might well be devoted to an account of the odd freaks and whimsicalities to be traced in the history of certain words. It may be of interest to give a few instances of the curious shifts to which people have been put to account

for the connection between words, and especially of the many cases which occur where, from a similarity of sound or sense, or both, between two words which are really quite distinct, an unconscious association has been formed.

The examples to be given may be divided into three kinds. Our first list of words is taken from that large class which, whether by accident or error, have become so like other already familiar words as to be unconsciously associated with them in derivation and meaning. Nine persons out of ten would probably give the derivation of 'blind-fold' as coming directly from 'blind' and 'fold,' from the practice of 'folding' a cloth round the eyes, as in the game of Blindman's Buff. The word has, however, nothing to do with 'fold,' but means 'felled,' or struck blind, and might be written 'blind-felled.' In the same way the word 'buttery' is easily confused with the common term 'butter,' with which, however, it has no connection, save in the minds of those who do not know it to be a contraction for 'bottlery,' a place where 'bottles' are kept, and over which the 'bottler' or 'butler' presides.

To speak of a person acting in a 'gingerly' fashion would certainly convey a clear enough idea, and we easily connect the word in some vague manner with the word 'ginger,' perhaps from the association in our minds of the sparing use made of that condiment. The word, however, is innocent of any such roundabout derivation, and comes directly from the old word 'gang,' to go—still preserved in the Scotch phrase, 'gang that gate'—and thus originally means with cautious, faltering, or 'gingerly' steps. Again, in using the word 'blunderbuss' we unconsciously imply a sense of disparagement for the shooting powers of our forefathers contrasted with the precision of the modern rifle. The word itself has, however, a terrible enough meaning, and disdains all connection with 'blunder.' 'Blunderbuss,' in fact, as we have it, is a strange corruption—perhaps not altogether untinged with the sense and sound of 'blunder'—of the old Dutch word 'donderbus,' which can be literally translated into the English 'thunder-box' or 'thunder-barrel.'

Two such simple words as 'greyhound' and 'humble-bee' seem the last to cause difficulty as to their meaning in ordinary use; yet few people would guess that the first part of the former is unconnected with our name for a common colour, and is in reality an Icelandic word signifying a 'dog,' the whole word thus becoming 'dog-hound.' In the case of 'humble-bee,' guesses would probably preponderate in favour of deriving the word from 'humble,' meaning 'lowly,' as opposed to the correct derivation from the 'humming' sound which is the distinguishing point about this insect. Perhaps, however, the popular derivation may be partly attributable to the well-known fable where a contrast is drawn between the plodding and contented bee and her gay and thriftless cousin the wasp. This word 'humble,' curiously enough, gives rise to another popular fallacy. In the phrase 'to eat humble-pie' there seems little ingenuity required to connect the word 'humble' with the ordinary use of the word. But with this in reality it has nothing to do, the 'humble-pie' being, properly speaking, the dish made

from the 'numbles' or inferior parts of a deer's carcase, which would naturally be the portion of menials or 'humble' folk.

In the case of the word 'steelyard,' a popular etymology which derived the word from 'steel' and 'yard' would have a seeming confirmation in the fact that the instrument designated is actually made of steel and is about three feet long. The real derivation of the word, however, takes us back to the 'yard,' or court, in London where the traders of the Continent sold their steel, and which was regulated by the 'Merchants of the Steelyard.' In this yard, or court, there would stand some kind of balance for weighing the metal, and this meaning soon supplanted the original word. 'Steelyard' has thus, as we see, so far as etymology goes, nothing to do with a yard measure, though such an idea is inseparably associated with our use of the word.

The help of an historical dictionary of the language would surely be necessary to bring us to believe that the easy-looking word 'shame-faced' is unconnected with face. The term is, however, a corruption of 'shamefast,' an old word meaning 'fast,' firm, or steadfast in shame or modesty; and the last syllable, 'fast,' being pronounced so like 'faced' or 'face,' the part of the body most expressive of the feeling of shame, the transformation of the word into its modern form becomes easy of explanation. Quite as legitimate as this transition seems that between paying off a man and 'cashing' him; yet the verb 'to cash' has nothing to do either with 'cash,' meaning money, or with 'cashier,' a person who looks after it. The verb comes from an old French word meaning to break off or discharge, and thus is unconnected with 'cash,' which, though now used in the sense of money, was originally applied to the box in which it was kept.

Two words, 'purblind' and 'parboil,' are interesting as showing how a false derivation or association of sound can change the meaning of a word. 'Purblind' originally meant 'purely blind'; but probably, through confusion with the verb 'to pore,' it has now the meaning of 'partly blind.' In the same way, to 'parboil' at first signified to boil 'purely' or thoroughly; but through confusion with the word 'part,' the meaning has been modified to that of boiling 'partly.'

Perhaps few would venture to seek a connection between 'oakum' and 'oak,' but fewer still would be happy enough to give the correct derivation, and connect it with 'comb,' the tool with which the substance is teased out.

The verb 'gang,' to go, which we saw lay at the root of the word 'gingerly,' is also of use to distinguish the two terms 'gauntlet' and 'gantlet,' which seem in some way to have been confused in sense as well as sound. The term 'gauntlet,' in the phrase 'to throw down the gauntlet,' is evidently a diminutive of the French 'gant,' a glove, and refers to the old feudal practice of the challenger in the lists throwing down the mailed glove, which was picked up by the acceptor of the challenge. But in the expression 'to run the gantlet' we have a word of totally distinct derivation, coming from 'gang,' to go, and referring to the space over which the culprit or fugitive had to 'gang' before he was

clear of danger. Once more: many people nowadays connect the expression 'train-oil' in some way with locomotives and railroads. There was no danger of this mistake sixty years ago, when trains were little known, and train-oil (compare tear, something squeezed out), or the expressed fat of whales, was a common article of domestic use.

We now pass to a second class of words which illustrate, from a slightly different point of view, the vagaries of popular etymology. No philological principle is found to hold with greater consistency and completeness than this, that words which, though originally perfectly understood, have come to lose their first clear meaning, very frequently undergo a change, whereby they become connected in form and sound with others totally distinct. People must have words which they can understand and recall; and in order to gain simplicity and ease in remembering, they do not scruple to mutilate an offending term beyond recognition. In Scotland, for example, the popular ear found nothing to attract it in the term 'lilac,' a word of Persian origin; but by changing the foreign name into 'lily-oak,' familiarity and ease in recognition were gained at the expense of strict terminology.

It is said that the manifestly corrupted word 'isinglass' owes its change from a foreign to its English dress to the popular fancy, which, finding the Dutch term 'huizenblas' (sturgeon-bladder) meaningless in English, quietly changed it into 'isinglass,' and secured its easy remembrance from association with the 'icing' purposes for which it is used, and the 'glassy' appearance it presents. In the same way, 'Bocage' Walk, in London, being unmeaning to the ordinary ear, soon became transformed into 'Birdcage' Walk, not because there ever were any birdcages there, but in order to have a word which might be familiar and easily recalled. The two terms, 'crayfish' and 'causeway' singularly exemplify the same ready method of treatment to which words are subjected when they fail to convey their meaning with the requisite ease. The last syllable of the French *écrevisse* would necessarily be without sense to us; and the ingenuity which converted it into 'fish,' and the whole word into 'crayfish,' at once gave the name an English look and a sound which might suggest the thing signified. In the case of 'causeway,' again, we find popular etymology overdoing itself. We have the modern French word 'chaussée,' which, through its progenitors, was represented in English by 'causey.' A vulgar ingenuity, however, stepped in and accounted for the last syllable by supplying what it considered the original spelling, 'way,' and thus left the first part of the word quite unaccounted for, though the word as a whole gained a form which rendered it more familiar to the English eye.

A still more remarkable instance of this tendency to change and even mutilate a word in order to give it a familiar and suggestive appearance is found in the expression 'jerked-beef,' which is a ready English substitute for 'charqui,' the Peruvian word for meat cooked in smoke, or 'jerked.' Such a liberty taken with a foreign word may readily be pardoned when so happy in result; but the necessity for changing 'lustrine,' a French word for silk, into 'lutestring,' may be questioned, seeing we have many words,

such as 'lustre' and 'lustrous,' from the same root. But there is no accounting for fancies. Many persons must have been struck with the awkward beginning of the line in the hundredth psalm :

For why? The Lord our God is good.

The truth is, popular ingenuity—represented in this case, perhaps, by the printer—has taken the liberty of changing the old word 'forwhy,' meaning 'because,' which gave good sense, and translated the original, but which had fallen out of common use, into the modern 'for why?' Surely the restoration of the word might still be attempted before it is too late.

Another curious instance of the false ingenuity of the popular mind when put to the test is to be seen in the simple-looking word 'titmouse.' The first part of this word is very easy, and means something small, as we see in 'titlark' and 'tomtit.' The Middle-English form of our word was, however, 'titmose,' the last part of which means a small bird, and has nothing to do with 'mouse.' Not only, however, did the popular fancy seize on the form 'titmouse' as more familiar and suggestive, but it was so captivated with its own cleverness that the plural of the word became 'titnice!'

The explanation of the word 'belfry' in Mr Skeat's Dictionary is interesting in this connection. The word had originally no connection with 'bell,' an idea which is now intimately associated with the term. The first meaning given is 'watch-tower,' from the Middle English 'berfry,' a watch-tower. The first part of this word is connected with 'borough,' the second with 'free.' As the practice grew of hanging 'bells' in such towers, people reminded themselves of the fact by changing the word 'berfry' into the modern 'belfry.' In modern times, with our wide diffusion of education, the spread of books, and the steadying influences of printing, the tendency, illustrated above, to sacrifice accuracy in terminology to simplicity in form and sound, cannot much longer hope to find illustration. Yet in the word 'sparrow-grass,' a corruption of 'asparagus,' we can still trace the striving of the popular ear to find a word which will sound less unfamiliar and unmeaning. Were the counteracting influences of education and printing to cease, this vulgar substitute might possibly find a place among the acknowledged vocables of the language.

There is still another class of words to which it may prove interesting to draw attention. The tendency to throw unfamiliar words into more intelligible form is often supplemented by a striving to account for them as they stand by some fanciful and generally fictitious explanation. The ancients were unaccountably ignorant of the principles of word-formation, and even so late a writer as Justinian derives the word 'testament' from 'testis,' a witness, which is right, and 'mens,' the mind, which is nonsense. Every one has heard of the famous derivation of the Latin 'lucus,' a grove, from 'lux,' light, the connection between the two words being explained by the fact that in groves there is little or no light!

The Greeks, when put to it to explain the word 'Amazons,' a tribe of female warriors ex-

celling in archery, broke the word up into two, 'a' and 'mazon,' which in Greek mean 'without a breast,' and, to give colour to this derivation, invented the absurd story of these warriors cutting off their right breasts to enable them to draw their bows more easily!—The writer was taught that the word 'barbarous' came from 'barba,' a beard, because such people did not shave; and that 'Scot-free' meant as free as the Scots when returning from a marauding expedition across the Border! This latter word of course really means free from contribution, 'scot' being a payment which is 'shot' into a box. The true meaning of the term is seen in the phrase 'scot and lot,' which forms the subject of an interesting paper in the Transactions of the Philological Society for 1867.

The famous story of the word 'sirloin,' or, more properly, 'surloin,' is of more recent creation. A king of England—the 'Merry Monarch,' most likely—coming in hungry one day from the chase, had served up to him a savoury loin of beef. So delighted was the famishing king at the sight of his favourite dish that he knighted it on the spot, and is it not known as 'Sir loin' even to this day? The story is of course a mere fabrication. The first part of the word, which seems to have tickled the fancy of talemongers, is a common component of words in our language, and appears in the common term 'surface,' 'Surloin,' or 'sirloin' will therefore mean simply the upper part of the loin, just as the *surface* is the upper face of anything. This word suggests another which has more recently been stripped of the tale that hung thereby. To an ordinary reader the term 'beef-eater' presents no difficulty either in signification or form, and the first meaning that suggests itself—a person who eats the beef of another, that is, his attendant—has now been acknowledged as the correct one. Yet the term has been the subject of much subtle though futile ingenuity. Mr Steevens, for example, takes the word from 'beaufetier,' one who attends at the side-table which was anciently placed in a 'beaufet,' the business of the beef-eaters being to attend the king at meals. Mr Skeat in his larger Etymological Dictionary dismisses this explanation in these words: 'When the French "beaufetier" can be found with the sense of waiter at a sideboard, in reasonably old French, or when the English "beef-eater" can be found spelt differently from its present spelling in a book earlier than the time of Mr Steevens, it will be sufficient time to discuss the question further.' In Mr Skeat's book will be found many other instances of the kind of words of which we treat.

Another word to which popular fancy—always attracted by what is unusual and out of the way—has attached a story, which, though not baseless, is yet inconsistent with fact, is the term 'cabal.' The vulgar derivation which gives it as coming from a combination of the initials of the five statesmen who formed the Cabinet of 1671, Clifford, Arlington, Buckingham, Ashley, and Lauderdale, seems ingenious enough to be true, were it not for the awkward fact that the term is really of Hebrew extraction, imported into the language and used a century earlier than the date given above.

Two other words will suffice to bring our list

to a close. What is the etymology of the term 'cockatrice?' It is a lineal descendant of the English and Greek word 'crocodile,' but the 'r'—a frequent offender in this respect—dropped out, and the word then became easily confounded with the English 'cock.' But the word, through this confusion with the name of a familiar bird, had lost much of its original terrible significance. To regain for it its lost association of terror and 'uncanniness,' while retaining its familiar sound, the hideous story was invented of the cockatrice being hatched from a cock's egg!—Lastly, in the expression 'Jerusalem artichoke' we have a curious turnabout of words which would require a lengthy explanation. Suffice it here to say that originally the word had nothing to do with the Holy City, but comes directly from 'girasole,' the Italian name for a sunflower. This blunder is now doubly irreparable. People will always connect this vegetable in some way with Jerusalem, and we are even taught to call the soup made from it 'Palestine Soup'!—One other word and we are done. Many people must have wondered where all the briars are grown from the roots of which are cut the pipes so well known to smokers as 'briar-root pipes.' It need scarcely be said that no pipes are made from the briar. The word briar-root is undoubtedly a corruption; and the derivation of 'Beirout' (a town which is said to export large quantities of the wood used in the manufacture) has been suggested. Most people would, however, prefer to side with Kingsley, and ascribe it to the French word for heath (*bruyère*), the tough woody fibre of which is peculiarly adapted for the purpose required.

THUNDERBOLT'S MATE.

By E. W. HORNING.

I.

PENELOPE LEES, cantering from the wool-shed to the home-station in the red light of a Riverina sunset, was, beyond a doubt, the pick of all the merry-looking, black-haired, blue-eyed little minxes in the colony. It is true that there was not another minx of any description within fifty miles of the Bilbil boundary-fence; but there was not a second Penelope in New South Wales; at all events, not one to compare with the Penelope that cantered home so briskly this evening, after a long day out at the shed. Her spirits were not always so high, nor her looks so jaunty and engaging. It was a special occasion: the day now dying had been the happiest day of Penelope's life: it was the first day of the shearing at Bilbil Station.

All day long little Miss Pen, on her piebald pony, had been helping with the sheep—really helping, not hindering. It was not the first time she had helped with the sheep; she could 'muster' with the best, and the mysteries of 'yarding-up' were not mysteries to Pen; but it was the first time she had been allowed out at the shed during shearing. Last year she was too young: the privilege had been promised her

when she should have entered 'double figures.' And now that Rubicon was passed; the child was ten; and three times a week, while shearing lasted, Pen was to be one of the regular hands for mustering the woolly sheep and driving the shorn ones back to their paddocks. The first day of this stirring work was at an end, and it had not disappointed her. This was why her blue eyes were so full of light, and her brown little face of animation. This was why she was pleased to imagine herself a real, big, bearded bushman; and why she must needs ride in the thick scrub, a mile wide of the track—the very thing a real bushman would *not* have done.

Not that there was the least fear of Penelope. She was the very last person to lose her way on Bilbil run. She knew every mile of it—particularly those few between the homestead and the woolshed—too well for that. But it was good practice to strike a straight line through the scrub when opportunity offered; and Pen was now in one of the thickest belts of scrub on the run, which was famous for its small share of useless timbered country, and for the extent of its fertile salt-bush plains. Here and there, where the short trees grew sparsely, pools of lingering sunlight lay across the pony's path; once a great carpet-snake—thick as a strong man's arm, and exquisitely marked—glided into its hole almost under his cantering hoofs; and more than once huge red kangaroos bounded noiselessly past, in front of his nose. The pony did not mind, being bush bred, and used to the swift, silent movements of its denizens. The silence, indeed, was extraordinary; it always is in a belt of scrub. Even the pony's canter was muffled in the soft sandy soil. Penelope apparently grew tired of the silence all at once; for she uncoiled the long lash of her stock-whip—her real bushman's stock-whip—and cracked it smartly. With the long lash swinging in the air for a second shot, she suddenly pulled up the pony. She fancied she had heard a human cry. She cracked the whip again: this time it was no fancy; a man's voice was calling faintly for help.

Penelope was startled, and for an instant greatly frightened. Then, as she could see nothing, she took about the wisest course open to her: she marked the spot where she had first heard the cry—which was being repeated at short intervals—and took it for the centre of a circle which she now proceeded to describe at a slow trot. The immediate result of this manoeuvre was that she almost rode over a man who was sitting on the ground in the shadow of a hop-bush with his two hands planted firmly behind him, and half his weight upon his straightened arms.

The pony shied: kangaroos it knew, and snakes it knew; but a solitary man squatting behind a hop-bush in the heart of the scrub was a distinct irregularity. The next moment Pen leapt lightly from the saddle—and the man

uttered one word, and that indistinctly: 'Water!'

Pen tore from her saddle the canvas water-bag which was another of her 'real bushman's' equipments. 'There's precious little in it, but there's a drop or two, I know,' she exclaimed nervously; and she was down at his side, wrenching the cork from the glass mouthpiece.

'Take care of that leg, for God's sake!' ejaculated the man.

'Why? Whatever's the matter?' She had noticed that his left leg was lying in an odd position.

'Broken,' answered the man; and his lips closed over the mouth-piece.

It was no misfortune that there was not more water in the bag. There was enough to moisten lips and tongue and throat, and a mouthful or two besides. Had there been more, the man might have done himself harm, as men have done before on obtaining water after enduring the pangs of prolonged thirst. Though far from satisfied, however, the man was relieved. Moreover, he knew now that he was saved. He sank back and closed his eyes with a look of weary thankfulness.

Penelope gazed down upon him, not liking to say anything, and uncertain for the moment what to do. He was a man, she guessed, of about her father's age—between forty and fifty; but his long black hair was not yet grizzled, nor was there a single gray strand in the bushy black beard and whiskers. Below the line of black hair, the forehead was ghastly in its pallor; and the deep bronze of the lower part of the face had paled into a sickly, yellow hue as of jaundice. The features were pinched and drawn; the closed eyes like deep-set caverns. The limbs were large and powerful, and had all the grace and suppleness of vigorous life—all but the left leg. That limb had the hard and motionless outline of death, and lay, besides, in an unnatural position. The man had neither coat nor 'swag,' but he wore long riding-boots and spurs; and this led Penelope to the conclusion—which turned out to be correct—that he had been thrown from horseback. She also noticed that his right hand rested upon his wideawake, which was on the ground at his side, as though he feared its being blown away; and this struck her as odd, seeing that the day was closing without a breath of wind.

At length he opened his eyes. 'How far is it to the homestead, missy?'

'From here? About two miles,' replied Pen.

'Do you think,' asked the fallen man, half shyly, 'they would send—if they knew?'

'Think? I know they would; why, of course. Only, the worst of it is, there's hardly any one at the homestead. There's only mother, and Sid the butcher, and Sammy the Chinnee cook. I don't suppose the groom's got in yet; he was mustering—and so was I. The rest are out at the shed. The shearing began to-day, you know.'

'How far from this is the shed, then?'

'Well, it's six miles from the homestead,' said Pen thoughtfully; 'so it must be about four from here. I'm certain it isn't a yard less than four miles from here: I've just come from there.'

'Do you think *they* would send? My leg's broken. I've been lying here twenty-four hours. But for you, little missy, to-night would have finished me, straight; though, for that matter—Bless me, missy, you're smart at mounting that little pony of yours!'

Penelope had vaulted back into the saddle. Her red little lips were tightly pressed, her teeth clenched. And there were no more sun-rays anywhere to be seen, but only a pale, pink reflection in the western sky.

'Are you going to ride back to the shed, little miss—alone—so late?'

'Yes; I'm off. They'll be here with the buggy in another hour.'

The man muttered a blessing: it was no good blessing her aloud, for Pen and her pony were a good twenty yards away: the trees and their shadows closed over them.

Before the sound of the galloping hoofs died away, the broken-legged bushman lifted his wide-awake from the ground; and under it all the while had lain a brace of revolvers.

Before the sound of hoofs returned, and with it that of wheels, the revolvers had disappeared. No one would have guessed that they were ten inches under ground. But the man's finger-nails were torn and bent, and the sand had penetrated to the quick.

II.

The boss of Bilbil admitted that evening that there was something after all in the Ambulance Movement. The admission was remarkable, because for years he had vowed that there was nothing in that movement. During his last long holiday in Melbourne he had attended a course of ambulance classes, to pacify his wife, who worried him into it, and to convince her out of his own experience that there was nothing in those classes; and he accepted the certificate which was duly awarded him as a conclusive proof that that certificate was within any fool's reach; thus disparaging himself to disparage the movement of which he had heard too much. The Philistine was converted now. A simple fracture had come in his way, a few simple directions had come back to his mind: to his great surprise, he knew all about it when the moment came: to his greater delight, the broken leg seemed to set itself. Late into that night—as late hours go, in the bush—William Lees stumped up and down his wife's sitting-room in ecstasies; delighted with himself, delighted with the ambulance classes; delighted with his wife, who had goaded him into attending them. His delight might have been less had she taken her triumph less gently; but as a matter of fact, she was doing her very best to read a book, and could not for his chatter.

'I never saw a neater break in my life,' William Lees reported for the twentieth time—'plain as a pike-staff and clean as a whistle. And I do believe I've set it safe and sound. He's sleeping now like a top.'

Mr Lees was hard-working, open-handed, and kindly, and as popular among the station hands as any squatter need wish to be. He was a man of prepossessing looks, with eyes as merry and good-natured and almost as blue as those of his

small daughter; and he joined a schoolboy's enthusiasm with a love of personal exertion which no schoolboy was ever yet known to exhibit.

'I am glad you have been able to make the poor man so comfortable,' remarked Mrs Lees—not for the first time, either—without looking up from her book.

'Comfortable? I've fixed him up A1; you should just see. He's in young Miller's room. I'll tell you what I've done: first of all, I've shifted'—

'I don't at all know how I shall get on with him upon my hands while I am all alone, as I am to be this shearing.'

There was some slight petulance in her tone; she had been obliged at last to shut up her book in despair. It was not that she was an atom less kind and good than her husband, in her own way. But it was a very different way. Mrs Lees was robust neither in health nor in spirits; in appearance she was delicate and pale, in her manner gentle; but there were signs of determination in her thin sweet face—particularly about the mouth—which were not difficult to read, and which, by the way, were reproduced pretty plainly in Penelope. She lay in one of those long, wicker-work arrangements which are more like sofas than chairs, as her husband paced the room and puffed his pipe; she disliked the smoke no less than the incessant tramping to and fro; but she complained of neither.

'Why bother your head about him, my dear?' said the boss, still marching up and down. 'If you just look him up now and then, and see that Sammy feeds him properly—he must live like a fighting-cock, you know—that'll be all that's necessary. I don't fancy, from what I see of him, that he's the one to talk much to anybody; but if, for instance, he cared to be read to, why, you—or even Pen—could do that for him; though not, of course, to any wearisome extent.'

For a while Mrs Lees remained silent and thoughtful. 'Has he told you all about the accident, Will?' she asked at length.

'He fell off his horse.'

'But the circumstances—was he alone?'

'I should think so; I didn't ask,' and Will Lees shrugged his shoulders, as much as to say that that was no business of his.

'Then what happened to his horse? And where was he bound for?'

'I really didn't ask,' answered the boss.

'Well, I think you ought to know *something* of the man, Will, dear.'

Lees stopped in his walk, and pointed at his wife the pipe-stem of masculine scorn. 'You ladies are so horribly suspicious!' he said. 'What business of mine is it who he is? What business of mine—or yours—whether the man is a humbug or not, since that's what you're driving at? There was no humbug about the broken leg; that's enough for me. It ought to be enough for you too; for he can't get at your silver spoons, my lady, and good old family plate, and priceless old ancestral jewels, and closets full of golden guineas—he can't get at any of them just yet a bit.'

The boss laughed loud at his pleasantry, being pleased with himself in every way to-night.

'No, but'—Mrs Lees began earnestly; then

she broke off: 'Dear me, how late it is! I am going to bed.'

She went. It had been on the tip of her tongue to express the objection she felt to being left alone, or practically alone, from Monday till Saturday, for six long weeks, with this stranger within the gates. But she remembered how heavily her husband had paid, the previous year, through not giving to the shearing that personal supervision which was of little use unless it began with the first shift in the early morning. She knew that the overseer was too young a man to manage thirty-six shearers, and half that number of 'rousabouts,' single-handed. She also knew that at a word from her, her husband would give up sleeping out at the shed; and this was the reason of all others why she held her tongue.

Nevertheless, William Lees did receive a hint as to the doubtful wisdom of leaving his wife and child alone at the homestead without protection during the inside of every week. It came from an outsider; in fact, from no other than the object of Mrs Lees's feminine suspicions. It was Saturday evening, the man having been brought in on the Thursday; the squatter had returned from the wool-shed for the week-end; and his very first care was to see how the broken leg was mending.

The man lay in a room in the 'barracks'—a superior sort of hut, with four rooms, sacred to the bachelors of the station. 'Now, Brown,' said the squatter, bustling in—Brown was the name the man had given—'let's have a look at the leg.'

The brief examination that followed was entirely satisfactory to the amateur bone-setter—there was no professional one within seventy miles of Bilbil. The starched bandages were hard as flint; the form of the leg was perfect; that the snap had been really as simple as it seemed, there could be no longer any doubt. What was far less satisfactory was the patient's face.

'I like the leg; it's doing very nicely,' said Lees, sitting down on the edge of the bed. 'But I don't like your looks: you look like death, man! Are you eating anything, Brown?'

'Plenty, sir, thank you. Sammy's a first-rate attendant.'

'But not first-rate company, eh? Come, my good fellow, I'm afraid you're moping. Mrs Lees tells me you seem to prefer being alone from morning till night; indeed, you've as good as told her so.'

The patient smiled faintly, and gazed at Lees with a strange expression in his cavernous eyes. 'Shall I tell you, sir, who mopes more at this station than I do?'

'By all means—if there is such a person.'

'But I don't want to give offence'—

'Then none shall be taken. Who is it?'

'The missis.'

'The mistress! What on earth do you mean, man?'

'There! I knew you wouldn't like it. But it's a fact. The missis mopes more'n I do. It's nervous work for lonely women at a station at night-time. Mrs Lees, begging your pardon, sir, is nervous, and well she may be.'

'Well she may be! My good fellow, what are you driving at?'

Brown closed his eyes. 'You've heard of Thunderbolt, sir?'

'I've heard of a villain known by that name. What about him? He's in Queensland, isn't he?'

'He's a good deal nearer home, sir,' replied Brown earnestly. 'If I'm not mistaken, I saw him a very little while ago. I don't think I *am* mistaken: I know him: I have very good reason to know him well—by sight.' A dark look came over the white face. Brown ground his teeth savagely. 'I was once stuck up by him,' he continued in a low voice. 'I shall never forget him. And I saw him as plain as I see you, Mr Lees,' said Brown impressively, opening his eyes again—'the day I broke my leg—in the paddock I broke it in!'

'In my paddock?' cried William Lees.

Brown raised his head an inch from the pillow and nodded. 'As sure as I lie here, sir. You heard of Moolah Station, twenty miles south o' this, being stuck up last Wednesday?'

'Just heard of it to-day; but that was never Thunderbolt?'

'It was never any one else, sir!'

'Then why should he leave *us* alone?—Are you quite certain you aren't mistaken, Brown? And—what the deuce is there to grin at, my man?'

'Nothing, sir. I beg pardon. Only Thunderbolt and Co. never *did* do two jobs running, with only twenty miles between them. Strike, and show clean heels; that's their line. I know them—I tell you I've been stuck up by them. Now, if you was to hear of them twenty miles *north*—'

'Has he a mate, then?'

'He had. But he was alone on Thursday—curse him! As for being mistaken, I know I'm not. I was in the scrub; he was in the open. It was just before my horse fell and smashed me—the horse that's never been seen since. You can guess now who got it. Thunderbolt has a sharp eye for horse-flesh.'

The boss jumped up from the bed. 'I wish to Heaven you'd told me this before, Brown!'

'My leg was that bad; I couldn't think of things.'

At this moment a hum of voices came through the open window from the long veranda opposite. The squatter looked out hastily. 'The Belton buggy!' he exclaimed. 'Young Rooper and Michie!' He hurried out. Brown closed his eyes wearily. But the buzz of voices outside grew louder and louder; and presently, back rushed Lees to the sick-room, his face flaming with excitement. 'You were right, Brown! I couldn't have believed it! It *was* that villain you saw!'

Brown raised himself upon one elbow. 'You don't mean that—that—they've caught him?'

'I do! He was taken at Belton this afternoon; old Rooper has got him there now; and young Rooper and Michie are on their way to the township for the police.'

A grin of exultation spread over Brown's wan features—to fade rapidly into a peevish smile of unbelief. His shoulders sank back feebly upon the pillows; he shook his head slowly from side to side.

'They'll never keep him—never, never, though

they'd caught him twenty times over! A slippery gentleman is Thunderbolt; I know him well; he stuck me up, I tell you—he stuck me up!'

STUDENT LIFE AT THE INNS OF COURT.

THE Inns of Court, each with its pleasant garden, its hall, its chapel, and its library, offer an agreeable picture to the eye wearied by the monotony of street after street of dingy buildings. The Inns or *hostels*, as these schools of law were anciently called, are but a stone's-throw from the busy thoroughfare; and should the stranger, tired of the noise and bustle of the London streets, turn down one of the many narrow little lanes by which they are approached, he will suddenly find himself in a region of stately buildings and silent courts and squares. Here is much to interest a lover of things ancient. He may, if he has strayed within the precincts of the Temple, visit the fine old church, with its effigies of recumbent Crusaders. Here, in a corner of the churchyard, is Goldsmith's grave; and hard by is Brick Court, where stood the building in which he wrote his *Animated Nature*, and in which, when times happened to be prosperous with him, which did not occur often, he made merry with his friends.

There is an old-world air about the Inns of Court that might easily beguile the stranger, if he were in a dreamy mood, into a fancy that time had slipped back a century or two. Nor would the illusion be dispelled if he could peep into the hall of the Middle Temple at six o'clock—the dinner hour—during term-time. He would see the benchers in their black gowns walking slowly up the hall, preceded by the head-porter in embroidered robe, carrying a long wand or mace. He would have noticed this official, before entering the hall, strike the floor twice with the end of his mace, and all the occupants, clad in black gowns, rise to their feet at the signal. These are the barristers and students. They remain standing till the benchers have reached their table and grace has been said. After dinner, another grace is said, and the benchers retire in the same order. At the Middle Temple, students and barristers dine together in messes of four, and the dishes are passed round in a manner prescribed by immemorial usage. Each mess is supplied with wine, and the old-fashioned custom of drinking with one another is still preserved.

Every afternoon during term-time a blast from a horn signals to the hungry student the approaching dinner hour. An old writer thus refers to this ancient custom: 'The panyer-man, by winding of his horn, summons the gentlemen to dinner and supper.' This 'panyer-man' also provided mustard, pepper, and vinegar for the hall; 'and hath for his wages yearly £3, 6s. 8d., and the fragments of certain tables.'

In a quaint old folio, published more than two centuries ago, the writer, describing the Inns of Court as they existed in his day, gives some curious information. The chief cook, he says, 'had divers vailes appertaining to his office—namely, dripping and scummings, the rumps and

kidneys of loynes of mutton, which is the usual supper-meat of this society, there being seldome any other joynt served in the hall.' Besides getting these delicacies, 'for his further benefit he was wont to prepare every Easter a breakfast of calves' heads, for which every gentleman gave twelvence or more, according to his discretion.' The same authority observes that only the sons of gentlemen studied the law, 'the vulgar sort of people not being able to undergo so great a charge.' The manners possessed by these sons of gentlemen could hardly have come up to modern notions of refinement, for in an enactment dated the fortieth year of Elizabeth, it was ordered that 'to avoid disturbance and confusion of service, every gentleman of this house [Gray's Inn] who should henceforth go down to the dresser, either to fetch his own meat or change the same; or not presently to sit down to his meat when the servitors have messed him; or take meat by strong hand from such as should serve them, to be put out of commons.'

Books in the olden time were scarce and very dear; but at the Middle Temple 'they had a simple library, in which were not many bookes besides the law, and that the library, by meanes that it stood alwayes open, and that the learners had not each of them a key unto it, it was at last robbed and spoiled of all the bookes in it.' But though they had lost their library, these gentlemen had other resources. After dinner and supper, the 'students and learners sat together by three and three in a company, and one of the three put some doubtful question in the law to the other two, and they reasoned and argued it; and this was observed every day through the year except festival day.' At the end of every term 'examination and search was made what exercises had been kept the same term and by whom; and likewise in the beginnings of the terms it was the custom to examine who kept their learning in the vacation time.' It is not stated what befell those who had failed to 'keep their learning.'

In hall and in church, students wore gowns and round caps; but boots and spurs, swords and cloaks, and extraordinary long hair, were forbidden. The regulations as to dress varied somewhat at the different Inns. At Gray's Inn a member wearing 'any gown, doublet, hose, or other outward garment of any light colour,' was to be expelled; and no member was to come into the hall to breakfast, dinner, or supper, or to any 'exercise of learning,' in boots. At Lincoln's Inn wearing a hat in hall or in chapel, or 'going abroad to London or Westminster' without a gown, was prohibited; 'and likewise, if any fellow of this house shall wear long hair or great ruffs, he shall be put out of commons.' The members of the Middle Temple were more fortunate, for 'they have no order for their apparell, but every one may go as he listeth, so that his apparell pretend no lightness or wantonness in the wearer.'

The authorities at the different Inns seem at one time to have strongly objected to their members wearing beards. There are several regulations on the subject. In the thirty-third year of Henry VIII., an order was issued that 'none of the fellows being in commons, or at his repast, should wear a beard;' the culprit

to pay double commons 'during such time as he should have any beard.' Apparently this order was insufficient; for in the first year of Mary's reign it was enacted that 'such as had beards should pay twelvence for every meal they continued in them; and every man to be shaven upon pain of putting out of commons.' Again, in the first year of Elizabeth, another order appeared 'that no fellow should wear any beard above a fortnight's growth.' But the fashion at that time of wearing beards grew so rapidly that the very next year, at a council held in Lincoln's Inn, it was agreed that all orders before that time touching beards should be repealed.

The chief butler had orders to take the names and inform the benchers of those who offended in the matter of hats, boots, long hair, and the like; 'for which he is commonly out of the young gentlemen's favour.' A delinquent was punished by fine or by 'putting him forth of commons; which is,' explains the chronicler, 'that he shall take no meate nor drynke among the fellowship untill the elders list to revoke their judgment.'

The masques and revels held in the halls of the Inns were often most magnificent entertainments. Stage-plays were sometimes performed; and at other times the barristers danced with each other, and afterwards one of the gentlemen was called on to give the judges a song. But that other kinds of play were not neglected appears from an order issued on the 17th of November in the fourth year of Charles I. Herein, it was ordered that 'all playing at dice, cards, or otherwise, in the hall, buttery, or butler's chamber should be thenceforth barred, and forbidden at all times of the year, the twenty daies in Christmas only excepted.'

At the present day, a student, if he be duly qualified in legal knowledge, may obtain his call to the bar after keeping twelve terms. Students who are at the same time members of one of the universities in the United Kingdom 'keep term' by dining in hall three times during term; other students must dine six times every term. The ceremony of 'call' varies slightly at the different Inns. The student dines in hall that night. At the Inner and Middle Temples he must appear in evening dress; and at the latter he must also be fully robed as a barrister, in wig, gown, and bands. The men called sign the roll, and the senior benchers makes a short speech wishing them success. At the Middle Temple, the new barristers, who dine in their wigs, &c., have the privilege of inviting their friends to a wine-party in the hall after dinner.

Between entrance at one of the Inns of Court and the final 'call' a period of three years usually elapses. During this time the student, when not engaged in study, may attend the lectures of the professors, or visit the law courts, or exercise his oratory at one of the legal debating societies. He may, if he need a little relaxation, play tennis in the gardens, or take martial exercise with his rifle corps. This volunteer regiment is recruited solely by barristers and students for the bar; hence, it is playfully nicknamed the 'Devil's Own.' Then there are the 'common rooms' attached to each Inn, where newspapers may be read and smoking indulged

in, and where lunch and other refreshments may be obtained. Lastly, on Sundays, the student can repair to the church belonging to his Inn and listen to a sermon by an able preacher.

This slight sketch may conclude with a pleasing account of the Inns as they appeared to Sir John Fortescue, writing in the reign of Henry VI. Sir John was Chief-justice of the King's Bench, and it is in his work written in praise of the laws of England that the following occurs: 'The students resorted thither in great numbers to be taught as in common schools. Here they learn to sing and exercise themselves in all kinds of harmony. On the working days they study law, and on the holy days Scripture, and their demeanour is like the behaviour of such as are coupled together in perfect amity. There is no place where are found so many students past childhood as here.'

THE SPORTSMAN'S CALENDAR IN PRINCE EDWARD ISLAND.

BY A RESIDENT.

THERE is no part of the continent of North America where sport of every kind, save deer-stalking, is more accessible and abundant than in the beautiful province of Prince Edward Island. Reposing on the cool, blue waters of the Gulf of St Lawrence, which bathe its sandy beaches, and lying directly in the route of the migratory birds, it cannot be otherwise.

Native game is scarce, and limited to the dusky grouse and blue or Arctic hare. There are foxes and bears and, until quite recently, beavers. The migrants are very numerous, and comprise the Canada goose, brent goose, black duck, teal, wid-geon, woodcock, snipe, golden plover, and about fifteen other varieties of the same family, great flocks of curlew, and many waders of less importance.

Early in March the 'Houk! houk!' of the wild goose is heard in the land, and sportsmen are everywhere on the alert. Geese come to the island in immense flocks, arriving before the ice disappears from the coast, but not before it breaks up. Gladdened by the first glimpse of water after their long and rapid flight from southern rice-fields and lagoons, the tired birds alight in the pools of water amid fissures in the ice, and there wait until the movements of the ice-floes shall have given them more sea-room. It is now in large part that the sportsman has to bag his game, since the geese are partial to fresh water, and there may have been early freshets in some of the rivers and brooks. At all events, he will get no sport without the aid of the goose-boat or tub, or both.

The goose-boat is of small dimensions, ill-proportioned, white, and fitted with side-wheels, which are worked from within by means of an ingenious pedal arrangement conveniently placed amidships. Thus it is easily carried from one place to another, pretty nearly resembles a lump of ice—which it is intended to do—and may be propelled through the water in almost absolute silence, when drifting is not possible. The boat is carried out across the 'board' or standing ice some time previous to the expected arrival of the

geese, and placed in a position whence it may be easily and rapidly launched. Decoys are placed in the water at various points, and the sportsman's patience and skill are rarely unrewarded. If the tub be used, it is sunk into a hole previously cut in the ice, of sufficient depth to conceal its occupant, who, having set out the decoys around him, awaits the incoming of the birds. This is, in fact, the more general method of circumventing the geese. Spring goose-shooting lasts about a month, and the quantity of birds killed is always large. There is scarcely a creek or a cove throughout the whole coast of the island where geese may not be found, hence every one who can goes after them. A youth of our acquaintance shot three hundred during the spring of 1891, for all of which he found a ready sale in Boston; and this is not an isolated case. Still, the number of geese does not sensibly diminish from year to year; indeed, sportsmen declare them to have been more plentiful last year than ever.

When they return in the autumn from their breeding-places in the arctic and semi-arctic regions of Greenland, Labrador, and Newfoundland, they are again shot in considerable numbers, and, because wilder, giving better sport than in the spring. Latterly, at this season, pinnaces have been employed to pursue the geese in the rivers and creeks. But since they have proved hobgoblins to the birds, in some instances frightening them away altogether from favourite haunts, their use has been forbidden, and more sportsman-like methods adopted.

Though fascinating to an unusual degree, spring goose-shooting involves serious risks to the health and personal safety of the sportsman, by reason of his long enforced exposure to the chilly winds that blow across the ice; and there is always the possibility of the ice suddenly breaking up and floating away seaward.

The departure of the common goose for higher latitudes allows the sportsman just enough time to prepare for the arrival of the more desirable and delicate, if smaller, brent goose, which takes place early in May. Brent are not nearly so plentiful as the Canada goose, though they are found at many points in the island in pretty considerable numbers. By this time the ice has almost disappeared, though a few blocks may possibly linger about. Again, the goose-boat, as described above, tub, and decoys are called into requisition, and good sport will be secured. The habits of the brent are such that the early morning is the best time to get them when they come to the inshore feeding-grounds. At other times they paddle off to sea, where it is next to impossible to get within range of them. The brent goose enjoys the distinction, with the black duck, of being one of the best table birds in existence. Since they do not, generally, reach our shores before the farmer begins his spring ploughing, brent are not so generally hunted as the common goose; hence they rarely fall save to the guns of the leisured class. The high market value of these fine birds, and the keen sport they provide, are powerful considerations, and, not uncommonly, quite enough to turn young yeomen from the field and tempt them to exchange the prosaic plough-handle for the gun. Brent leave the island about the middle of June with the same

mysterious suddenness as that which seems to mark all their movements, nor does a single bird appear thereafter until late in the autumn, when they pause with us for a brief breathing-space while passing south. As we write, a large flock are disporting themselves in the Hillsborough River, over against our residence, evidently preparing for their southward flight.

During the spring, goose-shooting parties of sportsmen leave Charlottetown for the haunts of the birds. Besides the usual sporting appliances, each party is provided with horse and wagon, the latter being built with a view to carrying the goose-boat if necessary. During their expedition they generally put up at the most convenient farmhouse.

It is generally thought that Prince Edward Island furnishes but little first-rate trout-fishing, though the exact contrary is the fact. We may not, it is true, boast of our rivers, for they are few; but such as they are, they really afford good opportunities for trout-fishing. The principal trout-rivers are the Dunk and Morrell, lying respectively east and west of the capital, and within easy access therefrom. Both rivers are carefully preserved, hence there is always a fixed certainty of sport. Besides this, heavy baskets may be caught all through the summer months in the tidal rivers, off the numerous sand-points which jut out from the land, though the fish are not generally larger than from one to three pounds. Good old Izaak has an extensive following in the Garden Province of Canada; nor is the gentle art as practised nowadays a whit less conducive to good manners and amiability than when he dropped his cunningly baited hook into the Cherwell and Avon and sat contemplatively on their grassy banks. The beginning of August brings the mackerel to our shores. On the 10th of August, black-duck shooting begins. At the end of the month the fields are everywhere dotted with golden plover and many other varieties.

Few islanders, save those whose living depends on it, devote any time to mackerel-fishing, though it is such rare sport if the fish be abundant. This rich and valuable fish is found in all our waters, sometimes in enormous numbers, though, we believe, somewhat less than in former years. In Great Britain and Ireland, mackerel are generally caught from boats under sail; with us, on the contrary, the boats are always anchored, finely chopped herring being thrown overboard to attract the fish thereto. In this way immense catches have been made; as, for instance, on a morning in August last a friend hooked and caught seven hundred and eighty fish in the space of a few hours. The chances of success in mackerel-fishing are fewer than in most other forms of sport. We have gone out to the fishing-grounds many times in succession, and have returned without a fish, though the good haul invariably came sooner or later.

Breeding in the island, black ducks are always abundant, and are shot from the 10th of August until about the middle of November, at which time they leave. They generally arrive from the south in June, though we have seen them on two occasions as early as March, and last year a couple were shot by an Indian some time in that month. The event was sufficiently noteworthy to be

reported in the newspapers. Our grass-grown and willow-clad mill-dams appear to be the favourite breeding-places of the black duck.

Plovers are to be found all over the island, though, unlike the geese, they only visit it once in the year on their homeward flight. The golden plover are always abundant, though they are rarely got at without decoys, and then they fall an easy prey. The decoys are often so irresistibly life-like as to deceive not only birds but men.

In September, snipe and woodcock may be shot in the marshes and covers, though these last are growing scarcer every year. Good bags, however, may yet be made in the less frequented parts of the island, and there is quite sufficient of this game to satisfy the true sportsman who enjoys a good day's walk. The woodcock is a good deal smaller than his British namesake, though nothing behind him in delicacy of flavour. He hails from the Southern States.

By the end of November, if the weather be open—if not earlier—the migrants have all departed; but so long as we have the grouse and hare, there is always something to shoot. The former is an excellent table-bird, and at the present moment cannot be bought in our markets for less than forty-five cents per brace, so great is the demand for it. Unlike the grouse—more properly ptarmigan—of Newfoundland, it never changes its colour, though its feathers are thicker and more abundant in winter than in summer. Grouse are growing scarcer every year, and, unless the mild provisions of our game-laws so far as they relate to these birds are strictly observed, they will ere long have become a thing of the past in Prince Edward Island. The hare is very abundant in every copse and grove. With the assistance of a good dog, he gives capital sport; but his flesh is of little value as food.

Deer have not been found on the island within the memory of any one living, nor, it would appear, for a long time before; but there can be little doubt that herds of moose and caribou roamed over the island at a remote period, since there are so many existing evidences to the fact.

In the absence of large rivers, we have but few salmon, though they occasionally ascend the Dunk and Morrell rivers, and have been taken there with the fly.

SPRING'S HERALD.

A VIOLET! sweet-scented, dainty-hued,
Within a hazel's snow-bound cranny set;
Safe sheltered from the northern tempests rude,
A violet!

Gray sombre skies and leafless trees; and yet—
Lest under Winter's sullen sway and crude,
Sweet Summer's sights and scents we might forget—

Deep in the woodland's dreary solitude,
'Mid last year's leaves—emblems of vain regret—
Nestles the pledge of Spring's beatitude,
A violet!

PRICE 1½d.

A VISIT TO ROCKALL.

ASK any decently informed person which is the most westerly of the British Islands, and it is ten to one that the first answer you get will be 'St Kilda.' Possibly your shake of the head will elicit—if your friend be a thoughtful person, with some knowledge of Ireland—the admission that it may be Achill or the Blaskets; and if you permit him a glance at the atlas, he will shut it up again with a bang and exclaim: 'I told you so—the Blaskets.' But do not give him time to register a private resolve to catch his less observant friends out in their geography with this answer to the question. Reopen the atlas, and take his hand and gently but firmly guide his finger to latitude 57° N. and longitude 14° W., and then chuckle softly to yourself as the map reveals to his astonished gaze the little red-coloured speck of Rockall.

Yes, unnoticed as it is in the school geographies, this lonely rock—more than one hundred and eighty miles west of St Kilda, and two hundred and ninety miles from the nearest point of the Scottish mainland—has a right to call itself a British Isle. For it is separated by an ocean a thousand fathoms deep from all other lands or island groups except the British, and stands, in fact, upon the edge of what we may call the British plateau, a solitary outpost left at the front, last relic and mute witness of the western coast of that retreating continent out of which the Atlantic waves have carved our Islands. But Trinity House sets no light upon its cliffs, and the Post-office ignores it; for it is uninhabited. Small wonder, then, that in this business age it is overlooked; small wonder even if it disappears altogether from the cheap atlas and primer of geography, even as it is doomed at no distant date to disappear actually beneath the waste of waters.

Yet there are plenty of people to whom the existence of Rockall is still a fact of practical interest. Ask the Shetland fisherman who sometimes in the summer lies for weeks in his stout-

built, well-found, but malodorous yawl, fishing in the neighbourhood of its rocky reefs and ledges. Ask the skipper of the outward-bound Baltic trader going north about, whom in foggy weather the clamour of its sea-fowl has warned, only just in time, of his proximity to its granite mass. Ask the weather-beaten master of the Dundee whaler who, caught in his return voyage by the equinoctial gales, has strained his eyes into the gloom and driving mist all night, fearful, while he steams vainly against the hurricane, of suddenly spying the gleam of its breakers. Ask the dark wiry little Breton sailor, whose tiny schooner, running before wind and waves with bare poles on the way home from the deep-sea fishing on the Iceland banks, has lurched helplessly past those thundering cliffs, only saved by the eddy of the wind recoiling from them. No one of these toilers of the deep forgets the existence of Rockall, or counts it too insignificant for its whereabouts to be carefully noted.

But should your curiosity be excited, as mine was long ago, to learn the features of the isle from those who have seen it, you will find it no easy task. They are scattered folk, and hard to come across; and harder still is it, when you have chanced upon one of them, to draw forth from him anything like a description of its appearance. To indicate with a dab of a tarry thumb its position on the chart seems description enough to a mariner. By dint of tedious cross-questioning I did once gather from a Shetlander that it was 'a peerie bit rock wi' shoal water to west'ard;' and from a more imaginative Swede, that it was 'jusst like a ship;' but anything more satisfying to the sentimental interest I always felt in this lone outlier of our shores I could not for many a year obtain. Last summer, however, I induced a friend, whom I met at Oban, and who begged me to come for a cruise in his yacht, to extend the voyage to Rockall.

The morning of our third day out from Stornoway—where we laid in provisions—was hazy, and the sea as calm as glass. By the patent log and the course we had run, my friend M— reckoned

that we must be pretty close to our destination. Nothing, however, broke our limited horizon; so, with directions to the mate to keep her on her course and sing out if he sighted anything, we went below to breakfast; nor did we allow our meal to be interrupted by the mate's announcement through the skylight of, 'A sail on the port bow.' When we came on deck, however, M— turned his glasses on the 'sail,' which the mate now pointed out abeam. 'By Jove!' he cried presently, 'that's the rummiest rig I've seen for many a long day;' and, as I took the glasses from him, he added: 'She must be a brig that has just bent on new royals or top-gall'ns'ls, or perhaps is busy bending them on now. Her lower sails are black, and whatever she is putting aloft is as white as snow. I suppose she is lying becalmed.'

I was just turning away, satisfied with M—'s explanation, and not much interested, when the man at the wheel, after ejecting his quid, and slowly drawing his sleeve across his mouth, hoarsely remarked: 'Beg pardon, sir; that's no vessel, that's a rock.'

In another glance we instantly recognised our error. The mysterious brig was the island we were in quest of! The yacht's head was at once laid direct for it by the somewhat crestfallen mate, and we busied ourselves with conjecture as to the possibility of the island possessing so lofty a peak as to be covered with perpetual snow. Rapidly nearing it, however, we soon made it out to be not more than a hundred feet high—as a matter of fact it is only seventy feet—and the snow hypothesis had to give way to the more obvious explanation that the white was due to the droppings of the countless seabirds which make the rock their home. About a quarter of a mile off, as we approached it from the north-west, a cast or two of the lead showed rapidly shoaling water; so the yacht's engines were stopped and her head swung round. The gig was quickly manned, and in a few minutes we were in the cool shadow cast by the cliff. Finding this side precipitous, we rowed slowly round by the east, half-deafened the while by the screams of the myriads of startled sea-fowl, till we came to the southern side, and there found a place where it was just possible, thanks to the fortunately calm state of the sea, to scramble from the boat on to the rocks, and thence up a small rift to the summit. Here we found ourselves on a scanty plateau, the greater part of which was taken up by the whitened hummock or peak which we had thought to be the topsails of a brig. No need for any botanist to make a pilgrimage hither! Not a scrap of vegetation could we discern in any part of this strange remnant of a vanished land. But what a paradise for the egg-collector in May! Fragments and chips of egg-shells abounded, some of them easily distinguishable as belonging to rare specimens.

While M— was busy taking an observation—the results of which, not tallying with the chart, gave him several hours' subsequent occupation in finding out his errors—and endeavouring to ascertain the extent of the island's surface by rough measurements with a rope, I occupied myself in identifying as far as I could the numerous varieties of sea-birds whose haunt we had invaded, and which kept up an indescribable din on every side. Kittiwakes predominated; and I soon perceived that the eastern face of the rock was the special preserve of their noisy colony. Terns, herring-gulls, and lesser black-backs formed most of the rest of the hovering crowd; while puffins, razor-bills, guillemots, and occasionally a little auk, darted seaward from their clefts and crannies and plumped into the water. Presently I made out some tiny petrels, owners, no doubt, of some of the holes abounding in the two feet or more of guano on which I stood; and then a bird which I took to be a shearwater, and now an extra flutter among the terns, directed my gaze to the dark form of a skua high aloft; perhaps one of the Great Skuas whose last breeding haunt in Foula I know but would not for untold gold reveal. At length the sight of a fulmar petrel, a specimen of which I greatly desired, determined me to send the sailors off to the yacht for my gun, forgotten in the hurry of our departure for the rock.

M—, who had completed his observations, and was now pouring a libation of Scotch whisky over a small cairn—which it had cost him and the men much labour to construct out of the few loose bits of granite available—decided to accompany them, declaring that he had enough of the heat and stench of the place, and would like to have a bath and be comfortable. So I sat down in the shadow of a rock by the water's edge, after shoving them off, and, lighting a pipe, fell to lazy speculation on the past history of this queer islet. Perhaps, I thought, when the volcano of Mull was rearing its cone of scorise and lava ten thousand feet into the frosty air, and the glaciers of Norway were grinding Caithness into shape, Rockall was a tall mountain bearing its ice-cap, and lording it over rugged dales where the western-wandering reindeer trooped amid the sparse junipers and birches and stunted firs, and browsed on the abundant mosses. Perhaps—who knows?—Tertiary man dwelt in its caves, and hunted the seal in its already sea-harassed fringe. And then, ages after the Continent retreated before the resistless ocean surge, it must have been an island, large at first, but ever dwindling, slowly dwindling, and watching its smaller brethren swallowed up one by one till it was left alone. Surely, in these later times, before it crumbled to a single peak, it had inhabitants, rude fisher folk, like those of St Kilda. What was their race? When did the last of them perish? Has

even no tradition of them survived into historic times?

Musing thus in the drowsy heat of noon, I presently fell into a doze, from which a splash of cold brine on my face awakened me. A gentle swell was beginning to sweep past my resting-place and to break against the rocks. Hastily rising, I became aware that a startling change had taken place. Sun, sky, horizon, yacht, all were blotted out from my view by a dense white veil of fog. I looked at my watch and found it was past one. But the boat had not returned! No; nor was it likely that the boat would even attempt to find the island till the fog lifted. Meanwhile, the current, which I now noticed setting strongly past my feet, was drifting my friends away. Here was a pretty go! I began to think I had had enough of Rockall, though it was not for some time that the full danger of my position dawned upon me. These summer fogs often last for days together; and should stormy weather come on before the yacht had an opportunity of finding me, my chance of getting off was small. I climbed up to the little peak, hoping to catch sight of the *Norah's* topmasts above the bank of mist; but it was in vain. Then I restlessly perambulated the whole of my little domain, barely fifty feet square, disturbing, perhaps, fresh varieties of sea-birds, but not caring to notice them; then I sat down upon the cairn and tried to smoke.

Hour after hour passed, and my anxiety grew. Late in the afternoon my hopes were raised by the sound of the *Norah's* steam siren, only to be dashed again as the melancholy hoots grew fainter and fainter and died away. Then night came on. I crept into the rift on the south side and shivered there till daybreak. I dare not say I slept. Mysterious noises, probably made by seals, and uncanny chucklings and sibilations, which I tried to put down to the birds, kept my nerves ajar. Had I possessed more imagination I suppose ghosts of wrecked mariners, phantom vikings or buccaneers, or corpses from galleons of the Armada or Dutch East Indiamen, would have crawled and flitted about the rocks and harrowed my susceptible soul. But the physical pain of hunger, cramp, and cold was enough for me.

The gray dawn at length came, and to my joy, brought with it a breeze which quickly dispelled the fog. How eagerly I stood up on the cairn and waved my cap and shouted as I saw the *Norah* emerge from the fog-bank and point her head towards me! How quickly all the oppressive sense of utter loneliness and abandonment melted away, and left me laughing at the fears which seemed so real a few minutes ago! With what confidence in the presence of my fellow-beings I threw myself into the water and swam out, cold and stiff as I was, when the boat on arriving, with M—— in it, more anxious and fagged than myself, could not, for the increased swell, venture alongside! And what a breakfast I ate!

No; I did not return to shoot that fulmar petrel. Stormy weather came on; and with a last look at the lonely rock that might easily have been my grave, already, as we looked, beginning to be enveloped in the spray of the

rising waves, we were glad to run before the gale to the shelter of Lough Swilly. But it will be long before I forget my visit to the most westerly and most solitary of British Isles.

THE IVORY GATE.*

By WALTER BESANT.

CHAPTER VIII.—IN HONOUR OF THE EVENT.

MAY one dwell upon so simple a thing as a small family dinner-party? It is generally undramatic and uneventful: it is not generally marked even by a new dish or a bottle of rare wine. Yet there lingers in the mind of every man the recollection of pleasant dinners. I should like to write a Book of Dinners, not a book for the *gourmet*, but a book of memories. It might be a most delightful volume. There would be in it the schoolboys' dinner. I remember a certain dinner at eighteen-pence a head, at Richmond, before we had the row in the boat, when we quarrelled and broke the oars over each other's heads, and very nearly capsized: a certain undergraduates' dinner, in which four men—three of whom are now ghosts—joined: the Ramblers' dinner, of lamb chops and bottled ale and mirth and merriment: the two-by-two dinner in the private room, a dainty dinner of sweet lamb, sweet bread, sweet peas, sweet looks, sweet Moselle, and sweet words. Is it really true that one never—never—gets young again? Some people do, I am sure, but they are under promise to say nothing about it. I shall—and then that dinner may perhaps—one cannot say—one never knows—and I suppose—if one was young again—that they would be found just as pretty as they ever were. There is the official dinner, stately and cold: the city dinner, which generally comes to a man when his digestion is no longer what it was: the family dinner, in which the intellect plays so small a part, because no one wastes his fine things on his brothers and sisters: the dinner at which one has to make a speech. Indeed, this Book of Dinners promises to be a most charming volume. I should attempt it, however, with trembling, because, to do it really well, one should be, first of all, a scholar, if only to appreciate things said and spoken, and in order to connect the illustrious past with food and drink. Next, he ought to be still young: he certainly must have a proper feeling for wine, and must certainly understand when and why one should be grateful to good Master Cook: he should be a past or present master in the Art of Love and a squire of Dames: he should be good at conversation: he must, in the old language, be a worshipper of Bacchus, Venus, Phœbus Apollo, the Muses nine and the Graces three. He must be no poor weakling, unable to enjoy the good creatures of flesh, fowl, fish, and wine: no boor: and no log insensible to loveliness.

Dinner, which should be a science, has long been treated as one of the Fine Arts. Now every Fine Art, as we all know, has its fashions and its caprices. Those who are old enough to remember the dinners of twenty, thirty, or forty years ago can remember many of their fashions

* Copyright 1892 in the United States of America by Harper & Brothers.

and caprices. In the Thirties, for instance, everything was carved upon the table. It required a strong man to give a dinner-party. Fortunately, a dinner then consisted of few dishes. They drank sherry with dinner and port afterwards. The champagne, if there was any, was sweet. The guests were bidden for half-past six; they sat down to dinner before seven. At eight the ladies went up-stairs: at half-past ten the men joined them. Their faces were flushed, their shoulders were inclined to lurch, and their speech was the least bit thick. Wonderful to relate, brandy-and-water used to be served to these toppers in the drawing-room itself.

Mr Dering had altered little in his dinner customs. They mostly belonged to the Sixties, with a survival of some belonging to the Thirties. Things were carved upon the sideboard: this was in deference to modern custom: champagne formed an integral part of the meal: but the dinner itself was solid: the cloth after dinner was removed, leaving the dark polished mahogany after the old fashion: the furniture of the room was also in the old style: the chairs were heavy and solid: the walls were hung with a dark crimson paper of velvety texture: the curtains and the carpets were red: there were pictures of game and fruit: the sideboard was as solid as the table.

Checkley the clerk, who was invited as a faithful servant of the house, to the celebration of the new partnership, was the first to arrive. Dressed in a hired suit, he looked like an undertaker's assistant: the gloom upon his face heightened the resemblance. Why the partnership caused this appearance of gloom, I know not. Certainly, he could never expect to be made a partner himself. It was perhaps a species of jealousy which filled his soul. He would no longer know so much of the business.

George came with the Mother-in-law Elect and the *fiancée*. Forgiveness, Peace, Amnesty, and Charity sat all together upon the brow of the elder lady. She was magnificent in a dark crimson velvet, and she had a good deal of gold about her arms and neck. Jewish ladies are said to show, by the magnificence of their attire, the prosperity of the business. Why not? It is a form of enjoying success. There are many forms: one man buys books: let him buy books: another collects pictures. Why not? One woman wears crimson velvet. Why not? In this way she enjoys her wealth and proclaims it. Again, why not? It seems to the philosopher a fond and vain thing to deck the person at all times, and especially fond when the person is middle-aged and no longer beautiful. We are not all philosophers. There are many middle-aged men who are extremely happy to put on their uniform and their medals and their glittering helmets. Mrs Arundel wore her velvet as if she enjoyed the colour of it, the richness of it, the light and shade that lay in its folds and the soft feel of it. She wore it, too, as an outward sign that this was a great occasion. Her daughter, Lady Dering, came also arrayed in a queenly dress of amber silk with an aigrette of feathers in her hair. To be sure, she was going on somewhere after the dinner. Elsie, for her part, came in a creamy white almost like a bride: but she looked much happier than most brides.

Hilda's husband, Sir Samuel, who was some six or seven years younger than his brother, was in appearance a typical man of wealth. The rich man can no longer, as in the days of good old Sir Thomas Gresham, illustrate his riches by costly furs, embroidered doublets, and heavy chains. He has to wear broadcloth and black. Yet there is an air, a carriage, which belongs to the rich man. In appearance, Sir Samuel was tall, like his brother, but not thin like him: he was corpulent: his face was red: he was bald, and he wore large whiskers, dyed black. The late dissensions were completely forgotten. Hilda embraced her sister fondly. 'My dear,' she whispered, 'we have heard all. Everything—everything is changed by these fortunate events. They do you the greatest credit.—George'—she took his hand and held it tenderly—'I cannot tell you how happy this news has made us all. You will be rich in the course of years. Sir Samuel was only saying, as we came along'—

'I was saying, young gentleman,' the Knight interrupted, 'that the most beautiful thing about money is the way it develops character. We do not ask for many virtues—only honesty and diligence—from the poor. When a man acquires wealth we look for his better qualities.'

'Yes, indeed,' Hilda murmured. 'His better qualities begin to show.—Elsie, dear, that is a very pretty frock. I don't think I have seen it before. How do you like my dress?'

George accepted this sudden turn in opinion with smiles. He laughed at it afterwards. For the moment it made him feel almost as if he was being rewarded for some virtuous action.

Dinner was announced at seven—such were the old-fashioned manners of this old gentleman. He led in Mrs Arundel, and placed Elsie on his left. At first, the dinner promised to be a silent feast. The two lovers were not disposed to talk much—they had not yet recovered from the overwhelming and astonishing events of the day. Sir Samuel never talked at the beginning of dinner—besides, there was turtle soup and red mullet and whitebait—it is sinful to divert your attention from these good creatures. His wife never talked at dinner or at any other time more than she could help. Your statuesque beauty seldom does. Talking much involves smiling and even laughing, which distorts the face. A woman must encourage men to talk: this she can do without saying much herself.

Presently Mr Dering roused himself and began to talk, with a visible effort, first to Mrs Arundel of things casual: then to Elsie: and then to his brother, but always with an effort, as if he was thinking of other things. And a constraint fell upon the party.

When the cloth was removed and the wine and fruit were placed upon the dark and lustrous board, he filled a glass and made a kind little speech.

'My Partner,' he said, 'I drink to you. May your connection with the House be prosperous! It is a very great good fortune for me to have found such a partner.—Elsie, I join you with my Partner. I wish you both every happiness.'

He drained the bumper and sent round the decanters.

Then he began to talk, and his discourse was most strange. 'Had it been,' said his brother afterwards, 'the idle fancies of some crack-brained writing fellow, I could have understood it; but from him—from a steady old solicitor—a man who has never countenanced any kind of nonsense—to be sure he said it was only an illusion. I hope it isn't a softening. Who ever heard of such a man as that having dreams and illusions?'

Certainly no one had ever before heard Mr Dering talk in this new manner. As a rule, he was silent and grave even at the head of his own table. He spoke little and then gravely. Tonight his talk as well as his face was changed. Who would have thought that Mr Dering should confess to illusions, and should relate dreams, and should be visited by such dreams? Remember that the speaker was seventy-five years of age, and that he had never before been known so much as to speak of benevolence. Then you will understand something of the bewilderment which fell upon the whole company.

He began by raising his head and smiling with a strange and new benignity—but Elsie thought of her portrait. 'We are all one family here,' he said; 'and I may talk. I want to tell you of a very remarkable thing that has recently happened to me. It has been growing, I now perceive, for some years. But it now holds me strongly, and it is one reason why I am anxious to have the affairs of the House in the hands of a younger man. For it may be a sign of the end. At seventy-five anything uncommon may be a sign.'

'You look well, Mr Dering, and as strong as most men of sixty,' said Mrs Arundel.

'Perhaps. I feel well and strong. The fact is that I am troubled—or pleased—or possessed—by an Illusion.'

'You with an Illusion?' said his brother.

'I myself. An Illusion possesses me. It whispers me from time to time that my life is wholly spent in promoting the happiness of other people.'

'Well,' said his brother, 'since you are a first-class solicitor, and manage the affairs of many people very much to their advantage, you certainly do promote their happiness.'

'Yes, yes—I suppose so. My Illusion further is that it is done outside my business—without any bill afterwards'—Checkley looked up with eyes wide open—'I am made to believe that I am working and living for the good of others. A curious Illusion, is it not?'

The City man shook his head. 'That any man can possibly live for the good of others is, I take it, always and under all circumstances an Illusion. In the present state of society—and a very admirable state it is'—he rolled his bald head as he spoke and his voice had a rich roll in it—'a man's first duty—his second duty—his third duty—his hundredth duty—is to himself. In the City it is his business to amass wealth—to roll it up—roll it up'—he expressed the words with feeling—'to invest it profitably—to watch it, and to nurse it as it fructifies—fructifies. Afterwards, when he is rich enough, if ever a man can be rich enough, he may exercise as much charity as he pleases—as he pleases. Charity seems to please some people as a glass of fine

wine'—he illustrated the comparison—'pleases the palate—pleases the palate.'

The lawyer listened politely and inclined his head.

'There is at least some method in my Illusion,' he went on. 'You mentioned it. The solicitor is always occupied with the conduct of other people's affairs. That must be admitted. He is always engaged in considering how best to guide his fellow-man through the labyrinthine world. He receives his fellow-man at his entrance into the world, as a ward: he receives him grown up, as a client; he advises him all his life at every step and in every emergency. If the client goes into partnership, or marries, or buys a house, or builds one, or gets into trouble, the solicitor assists and advises him. When the client grows old, the solicitor makes his will. When the client dies, the solicitor becomes his executor and his trustee, and administers his estate for him. It is thus a life, as I said, entirely spent for other people. I know not of any other, unless it be of medicine, that so much can be said. And think what terrors, what anxieties, what disappointments, the solicitor witnesses and alleviates! Think of the family scandals he hushes up and keeps secret! Good Heavens! if a solicitor in large practice were to tell what he knows, think of the terrible disclosures! He knows everything. He knows more than a Roman Catholic priest, because his penitents not only reveal their own sins but also those of their wives and sons and friends and partners. And anxiety, I may tell you, makes a man better at confessing than penitence. Sometimes we bring actions at law and issue writs and so forth. Well now: this part of our business, which is disagreeable to us, is actually the most beneficent of any. Because, by means of the cases brought before the High Court of Justice, we remind the world that it must be law abiding as well as law worthy. The Law, in order to win respect, must first win fear. Force comes before order. The memory of force must be kept up. The presence of force must be felt. For instance, I have a libel case just begun. It is rather a bad libel. My libeller will suffer: he will bleed: but he will bleed for the public good, because thousands who are only anxious to libel and slander, to calumniate and defame their neighbours, will be deterred. Oh! it will be a most beneficent case—far-reaching—striking terror into the hearts of ill-doers.—Well—this, my friends, is my Illusion. It is, I suppose, one of the many Illusions with which we cheat old age and rob it of its terrors. To anybody else I am a hard-fisted lawyer, exacting his pound of flesh from the unfortunate debtor, and making myself rich at the expense of the creditor.'

'Nonsense about how a man gets rich,' said the man of business. 'He can only get rich if he is capable. Quite right. Let the weak go under. Let the careless and the lazy starve.'

'At the same time,' said Elsie softly, 'it is not all illusion. There are others besides the careless and the lazy?'

'Sometimes,' the old lawyer went on, 'this Illusion of mine—oh! I know it is only Illusion—takes the form of a dream—so vivid that it comes back to me afterwards as a reality. In this dream, which is always the same, I seem

to have been engaged in some great scheme of practical benevolence?

'Practical—What? You engaged in Practical Benevolence?' the City man asked in profound astonishment. The Illusion was astonishing enough; but to have his brother talk of practical benevolence was amazing indeed.

'Practical benevolence,' repeated Mr Dering. His voice dropped. His eyes looked out into space: he seemed as one who narrates a story. 'It is a curiously persistent dream. It comes at irregular intervals; it pleases me while it lasts.—Oh! in the evening after dinner, while one takes a nap in the easy-chair, perhaps—it is, as I said, quite vivid. The action of this dream always takes place in the same room—a large room, plainly furnished, and looking out upon an open space—I should know it if I saw it—and it fills me with pleasure—in my dream—just to feel that I am—there is no other word for it—diffusing happiness. How I manage this diffusion, I can never remember; but there it is—good solid happiness, such as, in waking moments, one feels to be impossible.'

'Diffusing happiness—you!' said his brother.

'A very beautiful dream,' said Elsie. But no one dared to look in each other's face.

'This strange dream of mine,' continued Mr Dering, 'does not form part of that little Illusion, though it seems connected with it. And as I said, mostly it comes in the evening. The other day, however, I had it in the afternoon—went to sleep in my office, I suppose.—Did you find me asleep, Checkley? It was on Friday.'

'No. On Friday afternoon you went out.'

'Ah! When I came back, then—I had forgotten that I went out. Did I go out? Strange! Never mind. This continuous dream opens up a world of new ideas and things which are, I perceive, when I am awake, quite unreal and illusory. Yet they please. I see myself, as I said, diffusing happiness with open hands. The world which is thus made happier consists entirely of poor people. I move among them unseen: I listen to them: I see what they do, and I hear what they say. Mind—all this is as real and true to me as if it actually happened. And it fills me with admiration of the blessed state of poverty. In my dream I pity the rich, with all my heart. To get rich, I think—in this dream—they must have practised so many deceptions'—

'Brother! brother!' Sir Samuel held up both hands.

'In my dream—only in my dream. Those who inherit riches are burdened with the weight of their wealth, which will not suffer them to enter into the arena; will not allow them to develop and to exercise their talents, and afflicts them with the mental and bodily diseases that belong to indolence. The poor, on the other hand, who live from day to day, sometimes out of work for weeks together, practise easily the simple virtues of brotherly love, charity, and mutual helpfulness. They have learned to combine for the good of all rather than to fight, one against another, for selfish gain. It is the only world where all are borrowing and lending, giving and helping.'

'Brother, this dream of yours is like a socialist tract.'

'It may be. Yet you see how strongly it takes hold of me, that while I see the absurdity of the whole thing, it is not unpleasant to recall the recollection of it. Well—I do not know what set me talking about this dream.'

The smiles left his face: he became grave again: he ceased to talk: for the rest of the evening he was once more the old solicitor, weighed down with the affairs of other people.

'Checkley'—it was on the doorstep, and Sir Samuel waited while his wife said a few fond things to her sister—'what the devil came over my brother to-night?'

'I don't know indeed, Sir Samuel. I never heard him talk like that before. Doin' good to 'em? Servin' a writ upon 'em is more our line. I think he must be upset somewhere in his inside, and it's gone to his head.'

'Practical benevolence? Living for other people? Have you heard him complain of anything?'

'No, Sir Samuel. He never complains. Eats hearty, walks upright and strong, works like he always has worked.—Doin' good! And the blessedness of being pore! Seems most wonderful. Blessedness of being pore! Well, Sir Samuel, I've enjoyed that blessedness myself, and I know what it's like. Any or'nary preachin' chap might talk that nonsense; but for your eminent brother, Sir Samuel, such a lawyer as him—to be talking such stuff—if I may humbly so speak of my learned master's words—it is—Sir Samuel—it really is!'

'He said it was a dream, remember.—But I agree with you, Checkley. It is amazing.'

'Humph! The blessedness of being pore! And over such a glass of Port, too! I thought I should ha' rolled off my chair—I did, indeed.—Here's your good lady, Sir Samuel.'

'Elsie,' said Mrs Arundel in the carriage, 'I think it was high time that Mr Dering should take a partner. He to dream of practical benevolence? He to be diffusing happiness with open hands? Oh! most lamentable—I call it. However, the deeds are signed, and we are all right. In case of anything happening, it is a comfort to think that George's position would be only improved.'

MAGIC FINGERS.

BY ONE WHO IS BLIND.

It is said there are 'none so blind as those who won't see;' and if such obtuse folks are contrasted with those who can't see, the truth of the dictum becomes especially apparent. If we have the opportunity of observing them, we must occasionally be struck by the fact that the intelligent blind often know quite as much as, if not more of what is going on around them than many of those who are in full possession of all their senses. Their quickness of apprehension, their keenness of hearing, the sensitiveness of their touch, and the rapidity of their mental if not their bodily activity, are quite startling.

Albeit the eye is the most direct channel of knowledge to the brain, it is curious to observe not only how Nature compensates for the loss of

that organ, but how alert the other senses become. This seems to be generally assumed and admitted, yet only very recently has the world acted towards the blind in accordance with this assumption. Forty or fifty years ago they were regarded in Great Britain as an entirely helpless, unhappy class of beings, whom it was vain to try to educate up to the ordinary standard; and who could not be taught any methods of adequately earning their own living. It appeared to be thought that the loss of eyesight implied the loss of capacity to learn. Apart from the difficulties incident to the affliction, they were treated as incapable of understanding ordinary facts; all their faculties were supposed to be equally deadened, or at anyrate they were treated as if such was the case. Infinite pity was bestowed upon them of course, and the more so from the assumed hopelessness of their condition.

Amongst the indigent blind especially the state of things was lamentable to a degree quite incredible, and it should be more widely known than it is that the first steps in the way of reformation were taken by the late Lord Shaftesbury. He showed the direction in which the very poor and ignorant required help; and the good work which he began has been ably carried on and developed, until even in their case it has been found possible to endow their fingers with a certain amount of magic. The commencement of the movement started by this eminently noble man and his band of equally philanthropic workers is worth briefly recording. His own words describe what it was that stirred him to the effort. At one of the annual meetings of the 'Indigent Blind Visiting Society,' which has its offices at 27 Red Lion Square, W.C., he said: 'When we first began our movement, the poor blind were altogether uncared for. They were known to exist; but there were very few people who knew where they were to be found. They were hiding away in cellars and all sorts of places. At that time, a gentleman called on me and proposed that an institution should be founded for the purpose of visiting these poor people; and they were discovered in dark, damp slums, and were looked upon more as reptiles than human beings. It was supposed that because they did not see the light, they never were in need of warmth or fresh air; they were never visited or comforted; they never went out of doors because there was no one to take them; and a more wretched condition than they were in could not be conceived.'

In a recently published account of an interview with the then secretary of this institution, the late Mr W. C. Lester (himself blind), he gives many interesting details of its work. 'Its object is fourfold,' he says—namely, to provide the blind with readers at their own homes; with the means to obtain guides to conduct them hither and thither; with schools where they are taught the rudiments of education—reading, writing, arithmetic, and such small handicrafts as they seem capable of executing, such as knitting, netting, &c.; and finally, with temporal relief at the discretion of the Committee.

The result of all these efforts in their behalf has been to transform the condition of this lowest class of sufferers into one of comparative comfort, usefulness, and cheerful well-being.

On a higher social and intellectual level, however, it is that a much vaster change has happily taken place, and is at last advancing with rapid strides, thanks, no doubt, to the wider enlightenment of our times on most subjects, but mainly owing to the example set us on the Continent, and particularly in the United States. France, Germany, Norway, Sweden, and America long ago discovered what, as we have said, has been but slowly admitted here, and never acted on—namely, that when knowledge at one entrance is quite shut out, the remaining powers of acquiring it are stimulated to an unusual degree; and that, consequently, these need only be properly encouraged and trained to enable the sufferer to be placed comparatively on the same footing as the rest of mankind. We know, of course, that individual efforts in this direction, like that above quoted, have not been wanting, and that from time immemorial asylums have existed where the afflicted are taken good care of. But within the last twenty years only has any real attempt been made upon a broad comprehensive, wise, or scientific system to train and educate the blind physically and mentally. Following the example, however, set by the European nations and by our brethren across the Atlantic, the 'Royal Normal College and Academy of Music for the Blind' at Norwood, hard by the Crystal Palace, has commenced the labour in earnest in England, with results no less satisfactory than extraordinary. A visit to this interesting and admirable institution will show what a sound system of cultivation will do to make up for the loss of sight. It will prove beyond dispute that the pupils may be trained to fight the battle of life with a reasonable chance of passing through it victoriously, and not much in rear of their more fortunate fellow-creatures.

A feeling of the utmost astonishment in the first place will certainly be aroused by any one who chances to arrive at the College during play-time. It is scarcely possible to believe that those young people scampering about, shouting and rejoicing in all the exuberance of youthful spirits, are bereft of sight. Their activity and freedom of demeanour are amazing; and when, by closer acquaintance with the establishment, we learn how this is acquired, our surprise is only partially modified. The grounds attached to the College embrace some six acres, and afford ample opportunities for exercise. Free gymnastics, military drill, running, &c., and skating, develop the physical strength of the pupils.

A large covered gymnasium for boys, another for girls, and a swimming bath, have been added from time to time; so that for physical training there is probably no public school of its size for the 'seeing' that is better equipped, or where the average strength and agility of the pupils are greater. This physical training was from the first considered of paramount importance, and every year has confirmed such a view. Blind children are often enfeebled from the same cause which produced their blindness; added to which, from their difficulty in moving about freely, they are not inclined to take the active exercise which is so characteristic of the seeing at the same time of life; they therefore become timid, weak, and awkward; and these tendencies must be artificially counteracted.

Striking instances of how comparatively little the infirmity need interfere with the activity and the capacities of manhood might be cited; but as one is as good as a score, we have only to turn to the case of the late Henry Fawcett, Postmaster-general, as the freshest in our mind. True, he was not blind from childhood, which of course makes a great difference; but the determination he displayed not to allow his misfortune to interrupt his career, and the success which attended it, sufficiently proves what is possible. His love of the open air, manly exercise, and sport, had made him familiar with Nature; and he used to boast that, with an intelligent companion by his side, he could enjoy as fully as ever the beauties of the outer world in his walks, drives, and rides, for he rode as boldly almost after he had lost his sight as he did before. He also continued to the last to exercise with the keenest enjoyment his favourite sport of fishing, whilst intellectually he pursued his studies and executed his multifarious business transactions with a degree of energy and completeness not to be exceeded by the most competent.

Say that his case is scarcely representative of the ordinary run of blind people, we can still find in it the spirit which should animate us as to possibilities. As a rule, blindness entails a certain amount of poverty; and where a child is born blind of indigent parents, its case indeed looks hopeless. But it is just in this direction that the public has required, and is now receiving enlightenment. That child in all probability if subjected to the Normal College system of education, &c., may be eventually placed, as has been said, in a position to take his stand in the world on a nearly equal footing with his seeing brother. He can be taught to read, write, and cipher with all that these lead up to, if not as readily at least nearly as completely as any other average boy or girl; and if he is never wholly able to compete with the seeing in bread-winning, he can preserve a large amount of independence; whilst, if he possess a common capacity for music, that gift can be developed to a degree which will ensure him a career in certain branches of the art whereby he can, in every sense of the expression, earn his own living.

If we are surprised at the spectacle of blind children at play, assuredly we shall not be less so when we come to observe them at work. Then, indeed, we might believe that their fingers are endowed with magic. It is not our intention here to describe in detail the modern forms, apparatus, machinery, and systems of teaching. They will, however, well repay investigation; and as a compendium on the subject in all its bearings we would, short of a visit to Norwood, point to *The Education of the Blind—what it has been, is, and ought to be*, by T. R. Armitage, M.D. In passing, it may be added that to Dr Armitage is mainly due the improvement in the educational system now universally adopted in England. A rising physician, of high attainments and infinite promise, he was overtaken by atrophy of the optic nerve when still a young man; and knowing that he would be thus obliged to abandon his career in medicine, and having some independent means, he at once manfully faced his difficulty. Thenceforth, he determined to devote himself to the cause of his fellow-sufferers. He immedi-

ately set about mastering the state of their affairs in England; and contrasting it with what he found it to be in other countries, he sought with the utmost diligence, perseverance, and untiring zeal to bring up our teaching and training to the same level of excellence. The success which has crowned his efforts is proverbial amongst the blind. He is emphatically their friend; and is regarded, and will continue to be regarded, as one of the truest pioneers and reformers in all appertaining to the welfare of the class for whom he labours.

Everybody knows that there are embossed books, &c., for reading; but few outside those concerned are aware what a vast change has taken place in the system of embossed literature. That bulky volume of one of the Gospels which we have seen on the knees of some blind mendicant at a quiet street corner, and from which he is pretending to read with his fingers, in a dull monotonous voice, and with the air of a lesson known by heart, can be replaced by a book a quarter the size—more complete and far more quickly to be deciphered by the sensitive fingertips. The 'Braille' dotted alphabet has taken the place of all others, at least for educational purposes, and is one of the most ingenious of arbitrary alphabetical inventions, readily to be learned by the young, and possessing the immense advantage of being as readily written and afterwards read by the blind writer. By its means, too, music can be taught through the touch as completely as through the eye; and in listening to a concert given by the scholars of the Normal College, we might find a difficulty in believing that such perfect execution and such admirable compositions as are sometimes heard could emanate from a class living entirely in the land of darkness. Magic is the only word for it; the fingers become eyes; and there seems to be an optic disc in each of their tips capable of conveying intelligence to the brain as quickly, and in all respects as efficiently, as the veritable 'window of the soul' itself.

Whether the independence gained by such training as that afforded by the Normal College is greater in those who are blind from childhood or in those who meet with the affliction in mid-career, is a question. Cases like that of Henry Fawcett—and there are not a few similar—would indicate that a brave man can face the inevitable without the training—or very little of it—by which those who have never seen the light are enabled to make their way through the world. It is said that the first thing a person has to do who becomes blind in maturity is 'to learn to be blind'; whilst those who are so from childhood have, so to speak, always been in training. There is no novelty for them in the situation, and they should therefore, one would think, be morally if not physically better off in all respects. The affliction in their case is shorn of half its terrors—indeed, it cannot be called an affliction—the absence of light to those who have never seen it means nothing. Hence it might be argued that they should be fuller of resource; the more capable, the more independent; the more up to contrivances and dodges—in a word, the better able to contend with and outwit their infirmity. On the other hand, Henry Fawcett's career would go to prove the contrary, or that it made little

difference whether a man began life by learning to be blind or only took up the business midway. We must not forget, however, that his was an exceptional nature. His great intellectual powers carried him successfully through all he attempted; and it would have been strange if he had not speedily mastered the difficulties of the new trade so lamentably thrust upon him. Doubtless, he found a very short apprenticeship sufficient to make him an expert, although as a matter of fact he served his full time, and a great deal more, counting by the years of his blindness. The question, however, is a very large one, and we suspect it must greatly depend on the individual himself; for, with the blind as with the seeing, there are the dull and stupid as there are the bright and intelligent; and contrasting a blind specimen of the latter with a seeing specimen of the former, we shall justify the assertion with which we started—namely, that 'there are none so blind as those who won't see.' They have eyes for nothing; whereas the really blind are, so to speak, bristling with eyes. Every sense is alive with an intelligence often of more value than mere physical sight, and hence it may truly be said that theirs are Magic Fingers.

THUNDERBOLT'S MATE.

III.

THE Belton buggy had come twenty-five miles at express speed; the horses were steaming; and it was three miles farther to the township. Nevertheless, young Rooper was flicking his whip to push on, when Lees ran back, breathless, and got to the horses' heads. 'Hold on!'

'Can't, Mr Lees.'

'You can—you must. I'll send a man on horseback to the township in half the time it'll take you to drive. He'll be back with the police long under the hour. Meanwhile, you will have had something to eat with us, and I shall have run up a fresh pair for your buggy. These are dead-beat. It will save you time in the end.'

Rooper and Michie put their heads together, but only for an instant. The good sense of the squatter's proposal was as obvious as its good nature; besides, it was the Bilbil dinner hour, and the young men were hungry. As they alighted from the buggy, Lees ordered the Belton horses to be watered and turned loose, and Bushman and Bluebeard, his own favourite pair, to be run up from the horse-paddock. Then, Mr Lees having promptly despatched a messenger, they all adjourned to the dining-room, where they found Mrs Lees awaiting them. She was slightly pale, and scared by the sensational news, but eager to hear everything; and she was soon in possession not only of the facts of the present case, but of many other facts in connection with the notorious Thunderbolt, to say nothing of hearsay.

Thunderbolt, then, was rumoured to be a man of far greater refinement than most practitioners in his line—Burke, Morgan, or Ben Hall, for instance; he had also in some quarters a reputation for an alleged gallantry of bearing towards all women who came in his way professionally;

but in violence, in daring, and in insolence, he was not second to the worst of them. The Roopers had yarns about him from a station of theirs in Queensland, which was Thunderbolt's own colony and his commonest hunting-ground; but Michie, the Belton overseer, had actually exchanged shots with the desperado on a former occasion. You might have known Bob Michie a lifetime without knowing a word about that incident, or indeed about any other incident in which he had himself played a prominent part; but the old story was wrung from him to-night. He had been on the lower Queensland roads, in charge of sheep, and had happened to camp outside a township on the very night that the bank there was visited by Thunderbolt and his mate. Well, when the family at the bank were discovered sitting round the supper table like corpses—gagged every one of them and tied to their chairs—a hue and cry was started. It chanced that the discovery was made much sooner than the bushrangers had bargained for. The latter were surprised in camp, a few miles from the township; they had just time to mount their horses, which they had not unsaddled, and a hot chase followed. Michie outstripped competitors in pursuit, had a bullet through his hat, and in return shot off the little finger of either Thunderbolt or his mate; in the darkness it was impossible to tell which, only the finger was found.

'So I suppose the first thing you did to-day, when you'd got your man safe, was to make him show his hand, eh?' asked Lees, laughing; but neither Michie nor young Rooper had thought of it; and at this moment voices were heard outside. The messenger had returned with the buggy and with a policeman. The sergeant and another trooper were following on horseback, and would overtake the buggy. With hasty apologies and good-byes, the young men left the table and drove off. The meal would have gone on rather silently after that, for the men were all yearning to be at Belton and see the fun; but Penelope kept them busy answering her questions. She had drunk in every word that had fallen from the lips of the redoubtable Michie, and the item of the little finger in particular had entertained her greatly.

All this was on the Saturday evening. Sunday brought startling news. The buggy and the police had arrived at Belton only to find the bird flown—none knew how—none knew whither. Thunderbolt was at large again, and in Riverina.

It went against the grain with William Lees to return to the wool-shed that night; but his wife assured him that she had no fear so long as Penelope and she were not left entirely alone; and indeed the chances were that the bushranger, if not speedily recaptured, would press northward to the Queensland frontier. So Lees went, but left both the overseer and the storekeeper behind him at the homestead. It was arranged that these two should drive out to the shed the first thing each morning, returning at sundown; and the plan answered admirably. Never had the Bilbil flocks been better shorn; never had there been more perfect discipline at the Bilbil shed, never less grumbling. Moreover, the 'clip' throughout Riverina was likely to prove a better one than had been obtained for years.

Meanwhile, the broken leg went on mending in the most satisfactory fashion, and its owner seemed quite to have ingratiated himself with Mrs Lees and her little madcap daughter, Penelope. From the very first he had been patient, and grateful for the smallest thing done for him; but a certain moroseness, that had disfigured his manner in the earliest days, disfigured it no longer. Now he seemed glad enough of company; and Mrs Lees often sat with him. Once or twice he even asked to be read to; and Mrs Lees was not only good enough to read to him by the hour, but sensible enough to make the literature the lightest she could lay hands upon. Yet the man was far from desiring perpetual entertainment. Mrs Lees presently discovered that silent companionship had an attraction of its own for Brown. She found that she could sit beside him for hours, the silence of which he made no attempt to break so long as she showed no sign of going. She had only to gather up her work, however, for Brown to run up a barrier of questions to keep her where she was. It was as though silence lost its charm for him the moment it was enforced by solitude—as though a sympathetic presence was essential to the enjoyment of his reveries—queer traits, both of them, in a rough common bushman. But Brown was scarcely a common bushman, there was so much that was uncommon in him. Mrs Lees furtively watching the dark, brooding face, would have given worlds to share just one of poor Brown's waking dreams. Daily she burned for one little glimpse of the scenes that were passing before those wide-open, sunken eyes, staring at nothing in particular, but staring at it so long. Being a woman, and one without much to occupy her in the long, hot, sleepy days, this curiosity was very natural; but it was very well for her peace of mind that Mrs Lees had no way of gratifying her curiosity.

Once a day, sometimes twice, the dark inscrutable face underwent sudden transfiguration, and became ten years younger in expression; the eyes shone with delight and interest and admiration. It was when little Penelope appeared on the scene.

The homestead at Bilbil consisted of so many little trifling buildings, that to enumerate them would be insufferable; but there was one big building, with a little pocket edition of itself tacked on to one end of it, that was the centre of the system. The component parts of the big building were two long, bare, parallel verandas, with the station store, the dining-room, and some spare bedrooms enclosed between them. The pocket edition was called the Cottage, and as it only contained Mrs Lees's quarters, it was also something of an *édition de luxe*. Here the veranda was anything but bare; it was closed in by a screen of trellis-work and creepers, which turned it into a long room with open ends. In this cool retreat Mrs Lees's work-table and Mrs Lees's long wicker-work chair were generally pitched; in fact, Mrs Lees spent most of her time between this veranda and the sitting-room which opened upon it.

From the latter half of August, the long wicker-work chair—which was really more of a sofa—began to be occupied all day and every day by one person—the man Brown; and by

the first of September Brown was able to get backwards and forwards, between this and his room in the barracks, on a pair of makeshift crutches. It was here, then, that he saw so much of Mrs Lees—and spoke to her so little; and it was here that his face changed so when little Miss Pen flitted through the veranda and popped into the sitting-room, to take leave of her mother before her day's work out at the shed began, and when she came in—with her sprightly steps, and with sand and dust clinging to her little blue riding-habit—to report herself at the day's close. It is true that Pen seldom forgot to fling a word to poor Brown, lying quietly there in the long chair; but she was too completely self-engrossed, it is to be feared, to stop and talk to him for many seconds together; and he saw the last of her always too soon, with wistful eyes.

'Morning, Brown—how's the poor leg?' she would jerk out; or: 'Better, Brown? That's all right; lucky thing I found you though, eh?'

Brown was always ready with a cheerful answer; but she seldom waited to hear it; and as for firing questions back at her, with a view to detaining the sunbeam, that was a foregone failure.

One evening, however, she came in with a splendid emu's egg, which she had found for herself on the run; and this she could not resist stopping to show to Brown. He took it in his left hand—his right lay thrust in his breast-pocket—and admired it deliberately, so deliberately, that Pen could hardly restrain herself from snatching it away from him, in her eagerness to dart off and show it to some one else. But Brown had the egg in his hand, and his opportunity too. 'Have you ever seen one of these carved, missie?' he asked her shyly.

'Only once—over at Belton,' replied Pen. 'We have two carved ones here.'

'Would you like to have a carved one? Would you like to have this egg carved?'

Giddy little Pen was arrested at last: she forgot her anxiety to show the egg to the others: and her eyes glistened. 'Would I *not*!' she cried, with great emphasis. 'You don't mean to say *you* can carve emu eggs?'

'Well, I used to be able to do it; I used to turn an honest penny at the game—once,' Brown sighed. 'I suppose I haven't forgot how.'

Pen began clapping her hands—but quickly stopped. 'I say,' she said gravely, 'I haven't got any money, you know! I've only got what's in my money-box—and I don't think I may touch that,' she added doubtfully.

Brown stared at her out of his deep-set eyes; there was something reproachful in his look. 'It isn't likely I'm going to charge *you* anything, Miss Pen—now, is it? I'll carve this egg for love—as the saying is; and I'll carve it better than ever I carved an emu egg in my life before. Consider what you done for *me*, little miss!'

Pen considered. It yielded nothing. She was not accustomed to consider. 'What *have* I done?' she asked at last with eyes wide open.

Brown gazed at her some moments without replying; then he said: 'You saved my life, little miss—that's what you did!'

His tone struck the child as odd, somehow. 'Aren't you glad?' she asked, laughing. 'You

don't say it as though you were. And you ought to be *jolly* glad, you know.'

'I ought to be grateful—and grateful I am. But glad? Pretty well, Miss Pen—pretty well.'

Pen opened her eyes very wide indeed, and suddenly they filled with tears. She had never dreamt of any one being anything but glad not to die. The very idea of indifference in the matter was frightful to her, and frightening too. This poor man's pain, then, must be terrible; his unhappiness—very likely about something else—must be unbearable. Would it cheer him up at all if she, Pen, were to stop at home to-morrow and chatter to him all day, instead of going out as usual to her beloved shed? At all events, Pen resolved to try it; and as it was not quite the easiest thing in the world for such an extremely keen little stock-rider to do, she bound herself down then and there by a promise, and consigned the precious egg to Brown's safe keeping.

'To-morrow morning you shall carve it, Brown, do you see? And I'll sit here and see it done; and I shan't show it to any of the others till it is done—so just now you may keep it.'

Brown smiled upon her as she went. He was not smiling when she rushed and found him in the same place immediately after breakfast next morning. He was looking decidedly crestfallen. The emu egg was stuck in the wicker ring with which these long chairs are provided, and intended, if required, to hold a tumbler. Penelope snatched up the egg; but there was not a scratch upon its dark-green surface.

'Why,' cried Pen, visibly disappointed, 'you haven't even begun yet, you lazy man! Aren't you going to?'

'No, miss,' said Brown ruefully.

'Then why did you promise, I should like to know?' Pen had coloured up.

'Because I had forgotten something, Miss Pen.'

'Pray, what had you forgotten?' Pen demanded scornfully.

'Why, that an accident, which happened since I last touched an emu egg, has crippled me so that I can't carve any more.'

'Your right hand?'

'Yes.'

His right hand was out of sight, as usual, in the breast of his coat. Nor did he withdraw it; but, quick as thought, Penelope did so for him. The next moment she started back. The little finger was gone!

Brown saw her start, and he changed colour. A struggle was going on in the child's mind; he read it in her frightened, plucky little face; but he did not read the end of it; he expected her to run away and bring the place about his ears: instead of which, she looked him boldly in the face and exclaimed solemnly: 'You're Thunderbolt!'

Brown answered coolly: 'I'm not, miss. Whatever makes you think so? When have you heard of him?'

'The other night; Mr Michie was telling us—it was he that shot off your little finger for you! Stop a moment: of course you can't be Thunderbolt, because they'd taken him just then: so, then, you're his mate!'

Brown did not answer. His face was pale, his deep eyes were full of distress.

'Are you?' asked the child, in a wild whisper.

Their eyes were fastened together in a long mutual gaze. Even at that moment Pen realised, with a thrill of wonder, that she was neither trembling nor quailing under his glance, which indeed was gentle enough and reassuring; but she felt no surprise when he gravely bowed his head towards her, nor did her fears increase. She was certainly an odd child brought up in an odd way; but even so, she may not have realised quite what a bushranger was, for she stared this one out of countenance, and then said severely: 'Did you ever shoot any one?' (She may not have realised the full force of 'shooting any one,' either.)

'Never,' said Brown firmly.

'Never, on your word of honour?'

'I'm not supposed to have a word of honour,' said Brown, smiling faintly; 'but I only know I never did shoot a fellow-creature—as sure as I'm lying here! There was only one man I ever felt like shooting—Thunderbolt himself! When I was thrown, crossing the run here, he took my horse and left me to die.—Curse him; I could shoot *him* as I'd shoot an ox!—But forgive me, missy: it was you that saved me: it was you that saved me!'

For one moment Pen did feel frightened—the moment in which he had spoken of Thunderbolt. Then Brown's face had flared up with sudden passion; but now it was calm again; now it was calmer than before. And there was truth in the deep, dark, wistful eyes; and his eyes seemed to Pen more sad and more sunken than they had ever been before; and the whole appearance of the man was more pitiable to look upon—from grief and shame—not from fear and trembling. Child as she was—possibly, because she was a child—Pen read his look aright. It touched her to the heart. She took between her own brown fingers the maimed, coarse hand that she had dropped with such sudden terror. 'Look here,' she whispered distinctly, while a strangely wilful expression came over her determined little face. 'If I really did do what you say I did—if I really saved you that day—I'm not going to undo it by letting on. So I shan't tell a soul. I'll die first!'

THE DESERTS OF CALIFORNIA.

THE railroad of the Southern Pacific Company connecting San Francisco and New Orleans has in its passage through Southern California opened a most interesting and extensive region to the enjoyment of travellers, who, nevertheless, pass quickly across it, satisfied with what glimpses to the right and left they may catch on their way to the land beyond of perpetual roses and endless succession of fruits, never dreaming that they are ignoring the most novel and weird experiences of the trip.

The word 'desert' brings at once before us wide expanses of loose gray sand, varied only by white and glistening patches of the alkali so deadly to all serviceable growth; but the picture is true only in part. The Deserts of California are as varied in their surface and vegetation as

are those sections so noted for their wealth of production. Between San Francisco and Los Angeles lies the Mojave Desert, fast narrowing its limits by the encroachments of settlers, who utilise even the smallest streams from the mountains, that were once allowed to lose themselves in the sands, but are now conducted through pipes or trenches for domestic and irrigating purposes. Sometimes wells are dug or bored, the waters raised by the strong arms of a windmill, and dispensed as the all-powerful inspiration to use and beauty. Carried swiftly across the wide plains of Western California, the eye of the traveller yet has time to note the novelty and beauty of the scenery, varying with the season of passage: the numerous ranches, or farms, lying in every direction, separated by a mile or two of level grain-land, look like little villages, with their groups of buildings, their trees and shrubbery, and, crowning all, the giant windmills that wrest from earth its long-locked stores. Like gems of green they shine out from their golden setting of ripening grain, and at all seasons the winding roads and beaten paths are hospitable invitations that promise one a welcome to the hearts of tasteful homes.

Unreclaimed desert lands, with their wild growths of cactus, often intervene before reaching Los Angeles, or 'the city of the angels,' so long the theme of verse and story, but now fast losing its romantic Spanish characteristics in its metropolitan growth. Still eastward lies Pasadena, not a town in the usual sense, but a wide suburb of Los Angeles. In passing through it we see mile after mile dotted with tasteful villas, and green with their surrounding orange groves, all wrested from the so-called desert lands; then in quick succession we pass thriving villages and towns, the growth of the last ten years, until the largest, Colton, is left behind; here we ascend gradually for twenty-three miles, until a height of nearly three thousand feet above sea-level is reached at the San Geronio Pass, now so noted for its revivifying influence upon consumptive invalids. On its fertile breast nestle the little towns of Beaumont and Banning, sheltered by the Sierra Madre range on the north, the San Jacinto Mountains on the south, and opening eastward to the warm dry breath of the desert, refusing entrance to the coast-fogs by the forbidding shoulders of the intervening mountains.

Some six miles from Banning begins the great eastern desert of California, known as the Colorado. Our downward course here stops only at one hundred and fifty feet below sea-level, where the microscope shows the sand to be made up of tiny sea-shells, delicately perfect though so minute. These and the larger shells, abounding so plentifully, prove to the scientist that here was once the bottom of the sea, though his wisdom has not yet solved the riddle of the change to its present condition. However, shift-

ing sand is but one feature of this desert. In climbing the farther slope, Mammoth Tank Station is reached, its name suggested by the great natural tanks existing in the mountains near by, that, being filled during the heavy rains, are never empty the year round. This neighbourhood is one of the most picturesque and interesting of the eastern desert. Long stretches of the surface are often so hardened by the action of rain, wind, and sun, that a carriage and horses passing over them leave scarcely a trace behind; and where the disintegration of the rocks is going on among the mountain ranges that traverse these plains, the rush of the waters after heavy rains carries far out the many-angled fragments, dovetailing them together into a mosaic that runs through the gamut of rock-colours from white to black, forming a surface so firm and even that one might ride for miles without jolt or jar, were it not for the numerous dry water-beds that intersect it, dug out by the force of the torrents succeeding to the cloud-bursts that occur in their season on the mountain tops.

These wayward streams do not always follow the same channel; but where they do, there the moisture lingers, and often long lines of trees outline their borders; the branches interlacing overhead, form a grateful shade for a walk or a drive along the hardened water-bed.

Where the sand is loose and driven by the wind, a succession of hills has been formed to the south, whose soft tints change from misty white to a glowing salmon pink according as they are affected by the enchantment of distance or other atmospheric influences. Driving gaily along your boulevard of hardened sand, at its end you may go with a rush to the very top of one of these smooth-breasted mounds and behold a new wonder. Fenced in by many a neighbouring drift, a little sheltered nook is found where the lingering moisture inspires the growth of grass and flowers; and the desert quail come here for food and drink; and with your shot-gun in hand, if you are quick and sure with aim and trigger, a brace or two of these toothsome morsels may prove to you at the dinner hour that you are still a being of common earth and air, and not a sojourner in a land of myths and dreams. Here little groves of Mesquite trees nestle against the breast of the motherly mounds, and even from their tops a gnarled and twisted and uncertain growth often waves its wild arms in the changing winds. One symmetrical base I remember as an object of amused surprise, upon whose top writhed the serpents of the 'Laocoön' around the three central figures, in such close imitation of the originals in marble, that, were it not for the single branch of living green that grew from the head of the tallest of the group, there might have been a suspicion of some complicity between the hands of man and of Nature.

Water, then, is the wonder-worker, and it alone is needed to redeem much of this seemingly barren waste; hence the late agitation as to the

feasibility of supplying this want through deflecting the waters of neighbouring rivers into vast reservoirs for distribution. Late American newspapers state that a plan is on foot among capitalists in Chicago for irrigating three hundred thousand acres of these lands. Companies of capitalists have already done much in this direction, but on a smaller scale, and the redemption of all the desert lands is a scheme of such gigantic proportions that it is thought the Government only should take charge of its development.

The deserts are not so destitute of water as is often believed. Besides the many mountain streams that lose themselves in the sand, springs with varied characteristics abound; and occasionally wells furnish exhaustless supplies. One of the last-named is at Indio, the first station of any importance east of Banning. At Volcano, a few miles distant, are curious mud springs, boiling, evidently, over the influence of subterranean fires.

About twenty-six miles east of Banning, and a little off from the track of the Southern Pacific Railroad, between two spurs of the San Jacinto range of mountains, is a place called Palm Springs. It can be reached from the station of Seven Palms by a drive of about six miles across the sands. Here a few capitalists have interested themselves in testing the productiveness of the desert soil by supplying it with water. Orange, lemon, lime, and fig trees have been set out; some of the last-named began to bear the second year; for the others, a longer time is needed to test their success; but grape-vines come rapidly and abundantly into bearing, and vegetables can be raised the winter through. This place takes its name from a curious warm spring, the bottom of which has never been reached, as it indignantly resents all explorations in that direction by throwing up the lead, or the venturesome man, to the top, like a cork, and scratching him well with the sheets of fine sand it flings out with its bubbling waters. Persons, however, who are rheumatic, and who persevere in such baths, soon leave most of their pains behind.

The California rains occur between November and May, except on these sandy plains where the storms and 'washouts' are usual during the heated term. This makes it possible for the health-seeker to avoid all injurious dampness by passing the winter months in the gentle and balmy air of the desert, thus enjoying a perpetual summer without any great extremes of heat.

Dr Welwood Murray, a Scotchman, formerly of Edinburgh, whose health has been restored by a few years' enjoyment of this climate, has built a most picturesque and comfortable home at Palm Springs, where, during the winter months, he often receives those who, in his belief, may be benefited by a sojourn in this interesting region. Gradually, other homes are clustering around this central one; improvements of various kinds are being inaugurated, and the time cannot be far distant when this lovely spot will be a favourite resort and a sample of what may be repeated many times in like situations. It has long been a place of sojourn for the native Indian, and a few trained grape-vines of unknown age and astonishing circumference attest the fact; and it is no wonder that he should wish to linger here and feast his eyes before resuming his restless

tramp, when even as early as February and March the earth is aglow with flowers. You may go for miles through blossoms of the wild verbena, mostly purple and white, though occasionally a pink one blushes shyly between, while here and there tall stalks bearing flaunting colours wave like flags above the sea of bloom. In quiet nooks or in deep broad canyons of the mountains are the stately palms; and the climbing vines swing to the music of the waterfalls, hiding their charms for the lovers of Nature, who, patiently seeking, shall find and enjoy them.

The varied shapes and blossoms of the cactus are better known than other characteristics of these sections, as their fantastic forms and brilliant colours are easily seen *en route*, but a closer study of their peculiarities is abundantly rewarded. The tongue-shaped cactus, of which specimens are found in our conservatories, can be grown into an impenetrable hedge of twenty feet in height, its fruit being quite palatable if you can succeed in removing the skin, which is so filled with microscopic spines that it can be a torture to the unwary for days after eating. The cone-shaped cactus, which seldom grows beyond four or five feet in height, is crowned once a year with circles of blossoms, some shading from white through the yellows into green, others gorgeous in reds. One species takes the shape of branching coral, protects itself by innumerable yellow spines an inch in length, and it flowers in delicate yellows. The cane-shaped variety often shoots to a height of from ten to fourteen feet, and bursts, rocket-like, into brilliant bloom, from the top. Where moisture has failed to keep alive some of these children of the desert, and the storms have washed away the green pulp and the thorns, you find a delicate skeleton tube of lacework, regular and beautiful in its design, and all unarmed against your appropriation of its charms.

Mining in the mountains of the desert is carried on to some extent, but there, too, the lack of water is a limitation. There is no lack of gold and silver, but the expense of freeing them from their neighbouring rock discourages enterprise; but many of the Indians, Spaniards, and Mexicans, by working a few months in the mountains, unearth enough for their needs during the remainder of the year. It is true that they are primitive in their habits and desires, yet they are often as reckless in their expenditures as their more enlightened neighbours.

Wild rumours of boundless wealth hidden away in these mountain fastnesses often reach the ear of the traveller. The tale of the 'Lost Mine' in its various phases is as enchanting to his adult ear as were the wonders of the *Arabian Nights* to his youthful imagination; and many fruitless searches and schemes have been tried to win the secret from the rock or from the knowing ones among the tribes of Indians, who, it is said, are vowed to secrecy, the knowledge descending from father to son, and never to be revealed to a white man—a terrible death being the penalty of the broken oath. Whatever truth there may be behind these rumours, certain it is that there is a fascination in the wild life of the gold-seeker to many men who have expatriated themselves for the best years of their lives in their too often fruitless search; and the charms of the desert,

known best to the homeless tramp, who often winters in her warm bosom, have yet a growing hold upon those who are wearied with the sameness of all known things.

B E P P O.

BEPP0 was the name of the new pony; and whatever in the world could be the matter with him neither master nor man could make out. The master was the new rector of Mackstey, Mr Martin, inexperienced in country life; and Beppo was his first adventure in horse-flesh. The man was Roger. Roger was a character; once seen, never forgotten. Mr Martin's new living was so far away from a railway station that a pony-carriage seemed a necessity; and there was a large garden, which he certainly could not work without assistance. He therefore retained the services of the late rector's factotum, and a good servant Roger made. He was masterful, it was true, and had his own way in everything. He ruled the stable and garden with the rule of an autocrat. He mercilessly snubbed his master when he displayed any innocent want of understanding of the details of Roger's departments. But he was a good servant; he had the interests of his master thoroughly at heart; and he had further a great notion of the dignity of his position in the village. He was indeed held in high esteem as the best authority on stock in the place; he was capable, moreover, of cutting hair, or shaving a sick man, or clipping a horse, and could, in short, turn his hand to almost anything that was wanted.

Roger was in dismay on hearing that the new rector was going to buy a pony. 'What does the master know about horse-flesh? Sure as I'm here, he'll be done.' But he was forced to admire Beppo when he arrived, and to approve of the purchase when he had seen him in harness. He was fourteen and a half hands high, six years old, a light chestnut. Mr Martin had been to Suffolk to look at him, and had been driven round the neighbourhood by his owner—who was a medical man retiring from the active work of his profession—to try the pony's paces. So pleased had he been, that the bargain was concluded, and in a few days Beppo arrived safely at Mackstey.

To drive he was excellent. He made a good pace, stepped out well, and seemed to be frightened at nothing. Wheelbarrows and tricycles had no terrors for him, nor even trains at the level crossings. But when he got into his stable, all seemed changed. He flagged, drooped his head and ears, looked uneasily round whenever the door opened, and was generally out of sorts. At first this was set down to the change of groom; but he had no dislike for Roger, and indeed had taken to him readily. Could it be change of air? If so, he would be equally uneasy when being driven. After a week or ten days a farrier was called in; but he professed himself unable to do anything, until some definite ailment declared itself. And so master and man were both getting dispirited.

'You'd better let me go, sir,' said Roger.

'Why, Roger, wouldn't you have bought him?'

'Well, perhaps'—with reluctance the man

admitted—'I suppose I should. But I should have asked more about him, and found out if anything wasn't quite right. You can't buy a horse like you buy a leg o' mutton.'

'Well, but he's a good beast, Roger, and I'm sure you would have bought him if you had gone.'

'Maybe so, maybe so; but I never bought a pig in a poke yet.'

The gentleman from whom the purchase had been made was communicated with, and was much annoyed that anything should seem to be wrong. Nothing of the sort had ever been noticed before, and the animal was sound in every way. Mr Martin had in fact paid a guinea for a certificate to that effect. And so what to do they did not know.

Now it happened, about a fortnight after the purchase, that Mr Martin had to drive to the station, some six miles off, to fetch his sister's son, Alfred, to spend a portion of his holidays at Mackstey. He was a very bright boy of twelve, and a great favourite with Mrs Martin, and with his little cousin Lucy, who was some three years younger than Alfred, and who regarded him as a sort of perfection of boyhood. He was full of tricks and dodges and fun, without being mischievous; and as good-humoured and affectionate as a boy could be. At home he had numbers of pets, having a craze for live creatures; but he was never charged with ill-treating them, or neglecting them, or getting tired of them.

'How do, uncle?—Oh! what a jolly cob!' were the words with which he announced himself, bag in hand, as he emerged from the station gateway.

'How are you, Alfred?—All well at home?—That's right.—Yes, the pony looks nicely, doesn't he? You shall see him trot directly. But there's something wrong with him, I don't know what. He isn't all right in the stable.'

'What's amiss?' asked the boy.

'I wish I could tell you. Can't find out. He doesn't seem happy. Do you know anything about horse-flesh? I should think a couple of half-crowns well laid out, if you can give us a hint.'

Alfred laughed at the idea; but his experience was not among horses. And so they chatted on till they reached the rectory.

Here Lucy took possession of the boy at once, and showed off the premises to him. His interest was greatly aroused when he realised the immense capacity of the stable yard for a private menagerie. A broken-down summer-house in a neglected corner of the garden at once suggested rabbits.

'Will aunt let you keep rabbits, Lucy? I could soon turn this into a rabbit hutch.'

And so, chatting and laughing, skipping and trotting, the little girl led her cousin round to introduce him to Roger. The indisposition of the pony was heavy on Roger's soul; and he disliked visitors to the stable in consequence. There was a reproach to him, Roger, in asking a stranger what he could suggest.

Alfred went up directly to the pony's head, and patted it and spoke to it. 'Good old Beppo! What's amiss, Beppo? Don't you like Mackstey?'

The pony had looked round when the stable door opened, but drooped his head again listlessly when the children came in.

'Are you a horse-doctor, sir?' asked Roger.

'No, I'm not,' answered the boy; 'but I'm very fond of live beasts, and they generally like me.—You'll soon like me, won't you, Beppo?' And the creature certainly did seem to respond to the boy's caresses. 'And I've got an idea,' proceeded the boy; 'and I'll tell uncle.'

'What's your idea, sir? Better tell me. The master don't know much about horse-flesh.'

'Never mind. I'll tell him first.'

And so the children moved away. But no sooner were they out of Roger's hearing than Lucy began to coax. 'Tell me, Alfred dear, do tell me.'

'Promise not to tell, Lucy. I believe Beppo misses something—something on the ground. He keeps looking down. There has been a tame bird, or a puppy, or something, where he came from, that he was fond of. And he can't make it out. Haven't you got a dog?'

'Father talks of getting one,' answered the girl; 'but he hasn't heard of one yet.'

'Well, let's find uncle, and see what he thinks of my idea.'

Mr Martin was soon found, reading in the greenhouse. He was much tickled with the boy's fancy, and thought it characteristic and original; but was laughingly obliged to admit that he did not see much in it. However, on being pressed by Alfred, he undertook to write to Beppo's late owner and ask the question. Until a reply came, Roger was unceasing in his banter.

'Won't you tell me your idea, Master Alfred?' he asked. 'Come to nothing, eh? *Not* come to nothing? Going to cure him yet? We want a new farrier hereabouts. You might set up and make your fortune.'

Alfred did not mind this sort of joking at all, and generally retorted with effect.

And in a few days a letter came with a hamper from Beppo's late master. The letter said that the suggestion was a most happy one. There was a little kitten that used to frisk about Beppo's stable. The pony and the kitten were much attached to one another. Pussy would jump on the pony's back, play between his ears, drop into the manger, stand up and pat his nose; while Beppo would always look for her on his return from a drive. She had been much dispirited since her big play-fellow had gone, and as they were looking out for a home for her, they thought the best thing to do was to send her off at once to Mackstey, on the chance that Mr Martin might be able to keep her.

'Where's Alfred?' shouted Mr Martin. 'He shall open the hamper. He shall work out his idea all by himself.'

The boy took out the kitten carefully and gently and began to pet it and talk to it. Then he took it to the kitchen and buttered its paws, which he understood was the correct thing to do with a new cat. And then a procession advanced to the stable; Alfred bearing the kitten—who did not in the least understand what was going on—led the van; Lucy came next, in a state of great excitement; and last came Mr Martin, much amused, and very curious as to the result.

The result was as completely successful as their most sanguine expectations could have imagined. As soon as the stable door opened, the kitten jumped down with a loud 'Miew!' and bounded with tail erect to Beppo. He for his part at once recognised his friend, gave a glad whinny, and put his head down to the ground and fondled the little thing gently. Then she jumped up to the manger, on to the pony's head, and ran up and down the whole length of his back. It was the prettiest thing to see, both creatures almost beside themselves with delight. The pony indulged in a gentle murmur of content; the kitten purred loudly.

The cure was complete. Roger gave in. Lucy admired Alfred more than ever.

'Let's see if I can find those two half-crowns I promised you,' said Mr Martin, as they left the stable; 'I never paid money better earned in my life.'

THE ROYAL ASSENT.

'THE sittings of both Houses were temporarily suspended in order to allow time for a Queen's messenger to proceed to Osborne to obtain the Royal Assent to the Appropriation Bill. Her Majesty's assent was telegraphed to Westminster, and at the re-assembling of the Houses the Queen's Speech was read, and Parliament prorogued with the usual formalities.' Such was the announcement that appeared in the daily papers at the close of the last session of Parliament; and to those unacquainted with parliamentary procedure, a few words in reference to the practice that prevails regarding the Royal Assent may be of interest.

In the first place, every Bill, whether it be a public or private one, that has passed through all its stages in both Houses must, before it can become law, receive Her Majesty's assent. Previous to the reign of Henry VIII. this assent had to be given in person; but by an Act passed in that monarch's reign, enabling the assent to be given by Commission, signed by the royal hand, this necessity was dispensed with. When the royal assent is given in person, the Clerk of the Parliaments waits upon Her Majesty in the robing-room before she enters the House of Lords, reads a list of the Bills, and receives her commands upon them. When Her Majesty is seated upon the throne, the Clerk of the Crown reads the title of each Bill; the Clerk of the Parliaments, if it be a public Bill, then signifies the royal assent in Norman-French as follows: '*La Reyne le veult*' (The Queen wills it so to be). If the Bill be a private one, the form of assent is, '*Soit fait comme il est désiré*' (Be it as it is desired). When, however, a Bill of Supply is passed, the assent is expressed thus: '*La Reyne remercie ses bons sujets, accepte leur benevolence, et ainsi le veult*' (The Queen thanks her loyal subjects, accepts their benevolence, and wills it so to be). After each declaration by the Clerk, a gentle inclination is given by Her Majesty, indicating her assent. If, on the other hand, the royal assent is refused to any Bill, the Clerk declares, '*La Reyne s'avisera*' (The Queen will advise—or think—upon it).

When the assent is signified by Commission,

the Lords Commissioners read the Commission, and precisely the same formalities are observed as in the Queen's presence.

Before proceeding further, it may be well to note that at the time of the Commonwealth, Cromwell's assent to Bills was given in English; but at the Restoration, the old form of words, in vogue since the reign of Henry VII., was resorted to; and only one attempt has since been made to abolish it, when, in 1706, the House of Lords originated and passed a Bill to abolish the use of the French tongue in all parliamentary proceedings; the Bill was, however, dropped in the House of Commons; hence it is that the ancient custom of giving expression to the royal assent in Norman-French still prevails.

There have been occasions, though not many, on which the royal assent has been refused to Bills. Thus, it is recorded in the Journals of the House of Lords that this prerogative was exercised by Queen Elizabeth at the close of a session in 1597 to the extent of withholding her assent to no fewer than forty-eight Bills. Again, in 1692, we learn that William III. refused his assent to a Bill for the establishment of triennial parliaments. He was, however, induced some two years later to allow the Bill to become law. The last occasion on which the royal assent was withheld was in 1707, when Queen Anne refused assent to a Bill entitled, 'An Act for settling the Militia of that part of the Kingdom called Scotland.' Just one hundred years later, when Lord Howick (afterwards Earl Grey) introduced a Bill to allow Catholics to serve in the army and navy, it is said that George III. strongly intimated that he would rather abdicate than give his assent to such a Bill; imagining that he was forbidden by his coronation oath to admit Catholics to any offices in the State. When at length, in 1829, the Act was passed in both Houses, George IV. at first refused his assent to it, but yielded on learning from Lord Eldon that the withholding of the assent would involve the resignation of his ministers. Sir Archibald Alison, the historian, deals with the matter in touching detail, showing the agony of mind of the king during the progress of the measure through Parliament, and concludes his account by saying: 'Such was the despair of the king that the unhappy monarch threw his arms around Lord Eldon's neck and wept, entreating him not to desert him, for he had no other to advise with.'

Circumstances have arisen when the strict formula observed in reference to obtaining the royal assent has had to be abandoned, as at the passing of the Regency Bill in 1811, when the assent to the measure was obtained under peculiar circumstances. The king being incapable of exercising any authority, the Great Seal was nevertheless affixed to a Commission for giving the royal assent. Again, in 1830, when it became painful to George IV. to sign with his own hand, recourse was had to a special statute, passed for the purpose, by which he was enabled to appoint one or more persons with full power and authority to each affix, in the king's presence and by his command, the royal signature by means of a stamp prepared for the purpose.

A curious instance is chronicled of the royal assent having been given to a Bill by mistake. Such an occurrence is recorded as having taken

place in 1844, when one of two railway Bills, which had not passed through all its stages in the House of Lords, received, in error, the assent intended for the Bill in which all the formalities had been complied with. This singular oversight necessitated the passing of a special Act in order to rectify matters.

Finally, it may not be generally known that in 1876, when the Queen was about to visit the Continent, some doubts were expressed whether she could legally give her assent to Bills by Commission during her absence. No case could be found in which the assent had been so given; but it was discovered that in the reign of William and Mary this contingency had been provided for to the effect that 'nothing should be taken to exclude or debar His Majesty from the exercise of any act or royal power, but that every such act should be as good and effectual as if His Majesty was within the realm.' Her Majesty was advised, therefore, that she would be able to give her assent to Bills while absent from the realm. Accordingly, several Bills received the Queen's assent under these unique circumstances.

CONFIDENCES.

MAIDEN.

Oh, you merry, idle fellow, high upon a beech-bough
swaying,
Have you really no employment all the long bright
forenoon through
But to watch the golden sunbeams 'mid the green
leaves flitting, playing,
And the glist'ning pilewort gleaming in the meadows
under you?

BLACKBIRD.

Pretty maiden, pretty maiden, in the branches green
and shady
There's a nest with five eggs resting on a smooth and
cosy bed,
And since the dawn of morning I am singing to a
lady
Who above her cosy dwelling lifts, to hear me, her
brown head.
But now tell me, pretty maiden, do you linger here
each morning
Just to see the daisies flutter as the south wind rushes
by,
Or to view the Lenten Lilies all the breezy slopes
adorning,
Or the tassels swinging gaily on the scented larch-
trees nigh?

MAIDEN.

Whisper, blackbird, for a moment: much, indeed, I
love the meadows,
Gorsy fells, and fragrant larch-woods, where the south
winds murmur low
To the wind-flowers flushed and trembling, and the
shifting lights and shadows—
But I'm watching for my lover, and you must let no
one know.

THE MODERN WONDER-WORKER, ELECTRICITY.

It has constantly been the subject for remark that Britain is very backward compared with other countries in her adoption of Electricity for lighting and other purposes. But it is evident to those whose business takes them to the metropolis and our other large cities and towns that such a reproach cannot much longer hold good, for it is evident that electricity, for lighting purposes at least, is fast coming to the front.

It is not, perhaps, on the whole a misfortune for us that various circumstances have combined to cause some delay in calling in this comparatively new agent to our help. These circumstances comprise ill-considered legislation, which sought to tie too tightly the hands of those who wished to make commercial enterprise of electricity, under the fear that gigantic monopolies might be created, to the public prejudice. The nation had already been taught a severe lesson in the matter of gas and water companies, and the government erred on the right side when they sought to render such monopolies impossible in the case of electricity. But this delay has had one good effect, in enabling us to profit by the experiments, the failures as well as the successes, of others, notably our American friends, who, with characteristic energy, have allowed nothing to prevent them from lighting their towns, running their railways and tram-lines, and accomplishing all kinds of other work, by means of electricity.

Now, as we have already intimated, there is decided evidence of a reaction in this country. In London alone at this moment there are eleven different Electric Supply Companies, with a capital of more than four millions sterling. These companies hold sixteen central stations, and they have already laid conducting wires, or cables, under three hundred miles of streets. But this work is not all simply preparatory; for there are now more than half a million lamps burning every evening in the metropolis which owe their

radiance to the incandescent system, as well as nearly two thousand of the more brilliant arc-lights. Electricity, too, is used as a motor; and its use is increasing, driving various small machines, chiefly of a domestic character. It goes without saying that the price of the electric current must have been brought more in harmony with that of gas than it was a short time ago before these results could be brought about. But those who wish to get a really correct idea of the improved position which electricity is likely to assume in the near future as part of our commercial life and resources, should endeavour to pay a visit to the present International Electrical Exhibition at the Crystal Palace, which is without doubt the finest Exhibition of the kind which has yet been held. The directors have been fortunate in gaining the support of all the chief electricians in this country and abroad, and they have had the further advantage of conference with the special Committee appointed by the electrical section of the London Chamber of Commerce. The Exhibition, therefore, has been started under the most favourable auspices, and its success is unmistakable. Although the Crystal Palace at Sydenham has more available space than any other building in the kingdom, the area is by no means too large to accommodate the various magnificent exhibits which have been collected there.

The extent of the show may to some extent be appreciated when we point out that these exhibits have been arranged under fifteen different sections. These comprise the Phenomena and laws of Electricity; Electrical Measurements; Batteries of all kinds, both Primary and Secondary; and Dynamical Electricity. This last section is a very important one, for it includes the wonderful dynamo-machine, which in a measure may be looked upon as the very foundation of modern electrical science. The same section, too, comprises various types of steam-engines which have been devised for the express purpose of driving the modern dynamo-machine in its various forms. We should notice, too, that under

this head come numerous forms of gas-engines, a type of machine which has lately reached marvellous perfection, owing chiefly to the circumstance that the original patents have expired, and therefore the manufacture has been thrown open to all.

Electrical transmission, distribution, and regulation of the current form the subject-matter of another large section of this Exhibition. Under this head come cables, insulators, switches, and various minor appliances which are as necessary to success as the larger and more showy engines and machines already mentioned.

The section next in order is a most important one, for it deals with Motors. We say important, because there is no doubt that electricity in the near future will to some extent supplant the steam-engine, and we have here plenty of evidence that this will be the case. We may remind our readers that the electrical motor is really another name for the dynamo-machine; for it was soon discovered—and one of our greatest scientists pointed this out as one of the chief discoveries of the nineteenth century—that if this dynamo-machine, driven by a steam-engine or by water-power, as the case might be, were connected to a second machine of the same kind by wires, that machine, although it might be at a great distance from the primary one, was thrown into motion. It stands to reason that this being the case, it would be possible, from a central station, to convey motion to several machines at different distant points. This power has made possible electric railways, electric tramcars; besides which it has enabled the electrician to apply power to various machines, such as lifts, cranes, &c., which before were worked by steam or water. We do not here enter into the question of cost, which at present is a moot-point, but merely record the fact that these applications are possible by the use of the dynamo-machine used as a source of motion.

To the general public the question of electric lighting is the one that most closely appeals to them, and here the eye is literally satiated with the extraordinary brilliancy and beauty of the lights shown. The fascinating little Incandescent glow-lamp appears here in various forms, and suites of elegantly decorated rooms show how this wonderful illuminant can be used artistically, and can be made to lend itself to all kinds of decoration. For practically it is a lamp without danger of fire, and therefore it can be put in situations where any other form of light would be prohibitive. The more intense Arc-light is also exhibited here, in the form of street lamps, as search-lights for shipboard, and for other purposes where an intense illumination is called for. Electric heating naturally comes next to lighting, but for various causes this application of the current is quite in its infancy. Every tyro knows that if a current travelling along a conductor of a certain thickness is interrupted by

the interposition of a finer wire in the circuit which offers resistance to the passage of the current, that resistance is manifested by heat; and a well-known lecture-experiment proves that such a wire becomes incandescent in consequence of that resistance. Upon this principle there have been invented various appliances for boiling, heating, and soldering. Under the same head, too, should be included those wonderful machines which have recently come into use for the welding of metals. By bringing together two pieces of metal through which a powerful current is flowing, the junction is subjected to such an intense heat that the metals partly fuse; and by this means a more perfect weld is secured between them than by the old process of hammering.

The application of electricity to the various needs of metallurgy is more familiar to most people than are some of its more modern achievements, for electro-plated goods have now become familiar objects in most households for a number of years. The most recent phase of the process is the art of nickel-plating, which is bound to find extensive employment. We may also notice in this connection the possibility of procuring pure copper from its ore by means of electric deposition; and there is every hope that by the same agency the ores of the noble metals may some day be made to give up their riches. In our review of what the electric current does for us, it would be ungrateful to forget how much we owe to this modern magician for the power which it gives of inter-communication. In telegraphy there is nothing particularly new to record; but it is most interesting at this Exhibition to trace the history of electric telegraphy from the first needle instrument, that of Cook and Wheatstone, which was produced in the same year which saw the accession of Queen Victoria, and to follow the various improvements upon this instrument which were produced from year to year up to the present time, when the science of telegraphy has reached such wonderful perfection, that three or four messages can be sent along one wire in different directions at the same moment.

The telephone next claims our attention, and at the Crystal Palace we have the option of hearing by its means musical performances which are taking place in London, about ten miles distant; or in Liverpool or Manchester, which are about two hundred miles away from the building. Some of these performances are extraordinarily distinct, for the old difficulty of induction noises has in modern times been greatly reduced in intensity. There are various other applications of the electric current to be found in this wonderful Exhibition, but it would occupy too much of our space to describe them all.

Before closing our review of it, we should point out that enormous power is requisite to furnish the various lamps and other appliances with electrical energy. The source of this power is represented by a row of enormous boilers at one end of the vast machine-room; but besides these, the Crystal Palace District Supply Company, which has a station more than a mile

distant from the Palace, carries a cable to the building, through which energy equal to five hundred horse-power is called in to furnish additional help.

THE IVORY GATE.*

By WALTER BESANT.

CHAPTER IX.—AT THE GATES OF PARADISE.

MANY women have advanced the doctrine that the happiest time of life is that of their engagement. Of course no man can possibly understand this theory; but from a woman's point of view it can be defended because it is for some girls the most delightful thing in the world to be wooed; and until the church service is actually said and the ring is on the finger, the bride is Queen and Mistress; afterwards—not always. But the happiness of it depends upon its being a courtship without obstacles. Now, in the case of the young couple whose fortunes we are following, there was plenty of love with excellent wooing; but the engagement had been opposed by the whole tribe of Arundels, so that every time she met her lover it was in open rebellion against her mother. To go home from a walk with him only to find the silence of resentment at home is not pleasant. Again, we have seen how they were looking forward to a life of poverty—even of privation. Dame Penury with her pinching ways and shrewish tongue was going to be their constant lodger. Then the young man could not choose but ask himself whether he was not a selfish beast to take a girl out of plenty into privation. And the girl could not choose but ask herself whether she was not selfish in laying this great burden upon the back of her lover. No one can be indifferent to such a prospect: no one can contemplate with pleasure the cheese-parings, the savings, the management of such a life: no one can like having to make a penny do the work of sixpence: no one can rejoice as one steps down, down, down the social ladder; no one can anticipate with satisfaction the loss of gentleness for the daughters, and the loss of an adequate education for the sons.

'You will make me happy,' said the lover, 'at the cost of everything that makes life happy for yourself.'

'If I make you happy,' said the girl, 'I ask for nothing more. But oh! I am laying a heavy burden upon you. Can you bear it? Will you never blame me if the burden is greater than you can bear?'

And now all the trouble vanished like a cloud from the morning sky—vanished so completely that there was not a trace of it left anywhere. The accusing figure of her mother was changed into a smiling face of pleased and satisfied maternity: reproaches were turned into words of endearment, angry looks to presents and caresses. And as for her sister, you might have thought that all this good fortune was actually achieved and conquered by Elsie—otherwise, how could one justify the praise and flattery that Hilda now lavished upon her? She gave a great dinner as

a kind of official reception of the bridegroom into the family: she also gave a dance, at which she herself was the most beautiful woman—she stood in a conspicuous place all the evening, magnificently dressed, statuesque, wonderful: and Elsie was the prettiest girl at the party; but between the most beautiful woman and the prettiest girl was a difference! There is nothing like good fortune to bring out a girl's good qualities: Elsie had always had friends, now she might have numbered them by hundreds. Good fortune breeds friends as the sunshine creates the flowers. She was congratulated, caressed, and flattered enough to turn her head. Now, girls are so constituted that they love admiration, which is a kind of affection, even when it takes the form of flattery: and their heads may be easily turned; but they are as easily turned back again. And the house—the widow's house—which for so many years had been so dull and quiet a place, was transformed into a place of entertainment. It only wanted coloured lamps to make it another Vauxhall: it was crowded every night with the younger friends of bride and bridegroom. George had many friends. He was gregarious by nature: he was a rowing man on the athletic side: he had a healthy love and a light hand for things like billiards, shooting, and fishing: they are tastes which assist in the creation of friendships.

These friends—young fellows of like mind—came to the house in multitudes to rally round the man about to desert their ranks. Young men are forgiving: George would row no more among them: he would be lost to the billiard table, and to the club itself: yet they forgave him, and accepted his invitation and went to see the bride. They found her with the friends of her own age. Heavens! how the daring of one man in taking away a maiden from the band encourages others! There are six love-stories at least, all rising out of these evenings, and all of surpassing interest, had one the time to write them. They are both grave and gay: there are tears in every one: the course of true love in no case ran smooth except in the Story of the Two Stupids. Love's enemies can never effect aught against a Stupid, and so these Two Stupids became engaged without opposition, and were married with acclamations; but they are too Stupid—perhaps—to know their own happiness.

All this went on for three weeks. It was arranged that the happy pair should be married in the middle of August: they had resolved to spend their honeymoon in France, staying a few days in Paris, and then going on to see the towns and the country along the Loire, with the old city of Tours for their centre. They proposed to live entirely upon fruit and wine and kisses. No place in the world like Touraine for those who are so young, and so much in love, and so perfectly satisfied with so simple a diet. Even for those who take a cutlet with the fruit and the wine, there is no place equal to Touraine. Meantime, against the home-coming, a desirable flat was secured, not one of your little economical flats, all drawing-room with two or three rabbit hutches for bedrooms, but a large and highly decorated flat with all the newest appliances, large rooms, and a lift and plenty of space for the dinner-parties and receptions which Elsie

* Copyright 1892 in the United States of America by Harper & Brothers.

would have to give. The servants were engaged. The furniture was ordered, all in the advanced taste of the day—carpets, curtains, pictures, overmantels, cabinets, screens. Elsie went every day to her new home and found something omitted, and sat down in it to wonder what it would be like—this new life she was entering upon. Oh! it was a busy time.—Then there was her trousseau—everybody knows the amount of thought and care required for a trousseau: this was approaching completion—everybody knows the happiness, peculiar, and unlike any other kind of happiness, with which a girl contemplates a heap of 'things,' all her own. I suppose that it is only at her wedding that she can enjoy this happiness, for afterwards, the 'things' are not her own, but the things of the family. The bride's dress, another thing of supreme importance, had been tried on, though as yet it was very, very far from being finished. The bridesmaids, two of George's sisters, had also already tried on their dresses. They came every day, two very sweet girls, who have both to do with those six love-stories which will never, I fear, be told, to talk over the events and to see the presents. These came in daily, and were laid out in a room by themselves, looking very splendid: their splendour proved the wealth and the position of the pair, because rich presents are only given to rich people.

In a word, everybody was heartily, loyally sympathetic, as if to make up for the previous harshness and coldness. For four weeks this happiness lasted! It was on Monday, June 29th, that the golden shower descended upon them: it was on Monday, July 20th, that the rain of gold ceased, and another kind of cloud came up which speedily changed into a driving storm of rain and sleet and hail and ice and snow.

Look at them on Sunday. Before the storm there is generally a brief time of sunshine, warm and fine: after the storm, the calm that follows is a time of dismay, speechless and tearless. Sunday was the day before the storm: it was a day of sunshine without and within. The lovers spent the whole day together, hand in hand. They went to church together: they sat side by side, they warbled off the same hymn-book. The service proved, as the Preacher used to say, a season of refreshment, for never doth religion so uplift the soul as when it is entirely happy: the voices of the choir chanting the Psalms filled them with joy, and would have done so even if they had been penitential minors, and the lamentation of a sinner. Their hearts rose higher and higher as the Preacher exhorted, and would have flown upwards just as much whether he had brandished the terrors of the law or held out the gracious promise of the Gospel. For you see, at such a time as this, whatever was said or done only led this faithful pair farther and deeper into the shady glades and fragrant lawns and flowery dells of Love's Paradise.

Every church, at every service, and especially in the evening, contains many such lovers. You may know them by certain infallible signs. They sit very close together: they sing off the same book: their faces betray by the rigidity of their attitude, which is that of pretended attention, the far-away expression of their eyes, and

the absence of any external sign of emotion or sympathy with the preacher, that their hands, beneath some folds of the feminine gabardine, are closely clasped. It has sometimes pleased the philosopher and relieved the tedium of a dull sermon to look round the congregation and to pick out the lovers—here a pair and there a pair. Even in the Church, you see, Love is conqueror and King.

These lovers, therefore, went to church in a frame of mind truly heavenly: nobody in the whole congregation felt more deeply pious: every response was an Act of Praise: every prayer an Act of Gratitude: every hymn a personal Thank-offering. Beneath those calm faces was flying and rushing a whirlwind and confusion of hopes, memories, plans, projects, and gratitudes. He who looks back upon the days immediately before his wedding-day—most men no more remember their own emotions than a child remembers yesterday's earache—will wonder how he lived through that time of change, when all that he prayed for was granted, but on the condition of a turning upside down of all his habits, customs, and petted ways.

All round them sat the people, no doubt with minds wholly attuned to the service of Prayer and Praise. Well, the sheep in a flock to outward seeming are all alike, yet every animal has his own desires and small ambitions for himself. So I suppose with the congregation. As every man shuts the street door behind him and trudges along the way to church—the *Via Sacra*—with wife and children, he carries in his waistcoat pocket, close to his heart, a little packet of business cares to think upon during the sermon. And if all the thoughts of all the people could be collected after the sermon instead of the offertory, they would make a salutary oblation indeed.

'George,' said Elsie, as they came out, 'let us go into the Gardens and sit under a tree and talk. Let us get away from everybody for half an hour.'

Kensington Gardens were filled with the customary throng of those who, like themselves, had been to church. The carping philosopher says unkind things about Church, and Gardens, and Fashion. As if Church would ever keep like from congregating with like! There were shoals of beautiful girls, dressed as well as they knew or could afford: dozens of young fellows, and with them the no longer quite so young, the no longer young, the no longer young at all, the middle-aged, the elderly and the old, not to speak of the children. Elsie looked up and down the walk. 'We are never so much alone as in a crowd,' she said, with the air that some girls assume of saying an original thing—which no woman ever did say yet, unless by accident.

They joined the stream: presently George led the girl out of the road and across the grass to a place where two or three chairs were set under the trees. They sat down. Then occurred the miracle wrought in these gardens every day and all day long. Out of the ground sprang a man—for such he seemed, though doubtless a spirit-messenger—who demanded twopence. This paid, he vanished straightway. After the ceremony they talked.

'George,' said the girl, 'every day now, wher-

ever I am, even at church, I feel as if I should like to jump up and to sing and dance. This morning I should have liked a service all to ourselves—you to read and I to sing: you to pray and I to praise. I kept wondering if there was any girl in the place so happy as myself—or so unhappy as I was three short weeks ago.

'Elsie,' said George—a simple thing to say, but it had a thousand meanings.

'We have not deserved it. Indeed, indeed—we have not. Why are we singled out for such joy? We already had the greatest thing of all—we had love. That is happiness enough for some women. We only wanted a little more money, and now we have all this great fortune.'

'It is wonderful, Elsie!'

She laid her hand on his and spoke in her sweet low voice, gazing upwards. 'George! I am so happy, that I want everybody else to be happy as well. The angels, I am sure, must lose some of their joy in wishing that all were with them. I pity all those poor girls who have no lovers: all those poor married people who are lying in poverty: all those poor creatures who are trying for what they cannot get: all those who are weeping outside the gates of Heaven. George, it is a beautiful world, and it should be such a happy world: there should be nothing but joy all through life. There is such an abundance of happiness possible in it. Sadness is only a passing cloud: anxiety is only a touch of east wind: evil and pain are only fleeting shadows.'

She sighed and clasped her hands, and the tears rose to her eyes.

'We shall grow old together, George,' she went on, murmuring rather than speaking.—I omit her lover's interruptions and interjections.—'You will always love me, long after my beauty—you know you will call it beauty, George—is past and gone: even when I am a poor old crone doubled up in my arm-chair: you will always love me. My life will be full—full—full of love. Perhaps.'—Here her face flushed, and she stopped. 'We shall have no trouble about money: we shall go on always learning more and more, growing wiser and wiser and wiser. You will be a wise and good man, thinking and working all your life for other people, just as Mr Dering imagined—three weeks ago. Everybody will love and respect you. Then you will grow gray-headed, you poor, dear boy; and all the world will say how wise and strong you are; and I shall be prouder of my old husband than even I was of my young lover. The life that others have dreamed, we shall live. Every day shall come laden with its own joy, so that we would not, if we could help it, suffer it to go away.' She struck a deeper note, and her voice trembled and sank and her eyes filled with tears: 'Life shall be all happiness, as God intended for us. Even Death will be little sorrow, for the separation will be so short.' Once more she laid her hand on his.

Even to the most frivolous, the prospect of the wedded life awakens grave and solemn thoughts: for those who have eyes to see and ears to hear and brains to understand, there is no prospect so charged with chances and possibilities, where even life itself may become a Death in Life.

When George left her in the evening, he drove to see Athelstan.

'So,' he said, 'you have been courting all day. I suppose. You ought to have had enough of it. Sit down and have something—a pipe—a cigar.—Well—you are going to be very jolly, I suppose. Elsie's little fortune will help a bit, won't it?'

'I should think so, indeed.'

'Yes—I've been very glad, ever since you told me that the child had had this stroke of luck. I wonder who gave her the money? To be sure, there is plenty of money knocking about among the Arundels. Most of us have had a sort of instinct for making money. Put us down anywhere among a lot of men in a city, and we begin to transfer the contents of their pockets to our own.'

'Meanwhile, give up this old resentment. Come back to your own people. Come to our wedding.'

'I cannot possibly, unless you will tell me who forged that cheque. How could I go back to people who still believe me guilty? When you are married, I will go and see Elsie, which I can do with a light heart. You have not told any one about my return?'

'Certainly not. No one suspects, and no one talks or thinks about you.'

Athelstan laughed a little. 'That is a doubtful piece of information. Am I to rejoice or to weep, because I am completely forgotten and out of mind? It is rather humiliating, isn't it?'

'You are not forgotten at all. That is a different thing. Only they do not speak of you.'

'Well, George, never mind that now. I am glad you came to-night, because I have some news for you. I have found the commissioner who took the cheque to the Bank—actually found the man.'

'No! After all these years?'

'I wrote out the particulars of the case—briefly. Yesterday I took the paper to the commissioners' barrack in the Strand and offered a reward for the recovery of the man who had cashed the cheque. That same evening the man presented himself and claimed the reward. He remembered the thing very well—for this reason: the gentleman who employed him first sent him with a bag to a Parcel Delivery Office: he did not look at the address. The gentleman was staying at the Cecil Hotel. Now the commissioner was a one-armed man. Because he had only one arm, the gentleman—who was a pleasant-spoken gentleman—gave him ten shillings for his trouble, which was nine shillings more than his proper pay. The gentleman sent him to the Bank with this cheque to cash, and he returned with seven hundred and twenty pounds in ten-pound notes. Then it was that the gentleman—who seems to have been a free-handed gentleman—gave him ten shillings. The man says that he would know that gentleman anywhere. He was old, and had gray hair. He says that he should know him wherever he saw him. What do you think of that?'

'Well—it is something, if you could find that old man.'

'Why, of course it was Checkley—gray-haired

Checkley. We'll catch that old fox yet. Beware of Checkley. He's a Fox. He's a Worm. He's a creeping Centipede. When the old man goes, you must make Checkley pack.'

CONCERNING TRUFFLES.

FRUITFUL Nature has reserved to herself the exclusive right of reproducing certain of her most valued products, and in this category the Truffle must occupy a foremost place. Numerous have been the attempts to cultivate artificially this valuable fungus; but although many have devoted years of patient study to the problem, failure has marked their efforts, and the secrets of truffle growth and development have not yet been unveiled.

Oh! who can tell

The hidden power of herbes, and might of magic spell?

sang Spenser; and the query, so far as the truffle is concerned, still remains unsolved.

Although Nature guards so closely and so jealously the processes whereby the truffle is evolved, she shows no stinting hand in the distribution of this edible titbit. There are at least some forty varieties of the truffle native to British soil; but these, with one or two exceptions, are far inferior to those of France, which must be regarded as the real home of the truffle.

Perigieux and Angoulême have long enjoyed the reputation of producing the finest specimens of *Tuber melanosporum*; and Perigord pie has attained a world-wide celebrity. The common French truffle, like all true truffles, is a subterranean growth, and attains the size of a walnut or small potato. It is a winter growth, and its flesh when mature is of a blackish gray colour marbled with white veins. Late autumn and early winter are the best seasons for gathering, and such is the marketable value of the tuber sought after, that in a reputed truffle district but few escape detection. An argillaceous or calcareous soil is best adapted for their growth; and here, at the foot of oak and beech trees, diligent search is made for them. The truffle receives marked attention from other than human seekers, however. Squirrels, and hogs when they are turned loose to forage for themselves, are keen truffle-hunters. Advantage is taken of the penchant of the pig for truffles to train it to hunt systematically for the underground prize. The odour of many truffles is so potent—epicures compare that of the finer specimens to strawberry—that it exhales through the porous soil, and thus affords a clue to the keen-scented of the treasure that lies beneath.

When once a hog has tasted truffles, it needs but little encouragement to develop it into an inveterate truffle-hunter. Dogs, however, from their greater docility and the less voracious character of their appetites, are preferred for this business. The canine fungus-hunter receives his training while young, and the method generally pursued is as follows. Finely-cut or sliced truffles are mixed daily with their food until they become imbued with a liking for the flavour, and, what is perhaps of quite as much importance, they come to regard the flavour of truffles as

an inherent quality of all their food. The very odour of truffles will thus suggest a meal. The next step is to take the dog into the fields or woods and place a dish of *filet aux truffes* in some sequestered nook and cover it with earth. The dog is then encouraged to hunt for it; and the promptings of hunger contribute as much to the desired result as do the urgings of its master, for the dog is always taken out fasting. On finding the game the dog is always rewarded with some little delicacy, which incites him to further exertions. Poachers for truffles are great nuisances, and landowners are loud in their complaints at the mischief wrought by them and their attendant dogs or pigs.

In the Italian markets the best French truffles are sold at prices ranging from ten to twelve shillings a pound. Italy, however, is not devoid of its own truffles, in the eating of which the Italians allow themselves a much wider latitude than they do in the case of fungi which grow on the surface of the ground. Our meadow mushroom, with its pretty pink gills and delicate flavour, comes in Italy under the ban of things poisonous; and the Italian peasantry in certain districts, renowned as they are for the extensive nature of their vocabulary of imprecations, can give vent to no bitterer curse than, 'May you die of a Pratiolo,' mushroom-poisoning being supposed to be the most fearful of deaths.

To truffles, however, they are more tolerant, and less superstitious as to their unwholesome character. In the case of mushrooms, the policy generally adopted is, 'Prove it harmless, and we will eat it.' With truffles, however, you must prove the vegetable noxious before they will abstain from eating it.

The Italian truffle (*Tuber magnatum*) is essentially Italian. It is brownish-coloured without, liver-coloured within, and strongly scented with the odour of garlic. Some authorities state the odour of old truffles of this species to resemble onions or strong decaying cheese. It resembles its French *confrère* in that it is best gathered in the autumn, and most frequently found in plantations of willows, poplar, oak, and beech; but it differs from it by sometimes occurring in abundance in cultivated fields. The Italian peasantry prefer their truffles boiled or roasted in hot ashes; and the wealthier section of the community prefer to import their truffles from France rather than patronise the varieties indigenous to their own soil.

We have stated above that the number of species found in Great Britain is upwards of forty. Of this number *Tuber aestivum* is the most esteemed. In size it resembles a small apple, and it is covered with coarse polygonal warts. It grows best between July and December, and prefers beech or oak woods and a chalky or clayey soil to any other. Its market price varies from two to five shillings per pound, and its odour, like that of its continental brethren, is strong and penetrating. The demand for English truffles is much greater than is imagined, much greater, indeed, than the supply, and the result is that the public have palmed upon them an inferior substitute.

The most common of the 'false truffles' is a fungus of the puff-ball family, by name *Scleroderma vulgare*. In France, large quantities of

this growth are canned each season, and exported as genuine truffles; while in Epping Forest, many needy Frenchmen and Italians earn a precarious livelihood by gathering this 'false truffle' and selling it to restaurant keepers of the baser sort. For *Scleroderma vulgare* forms an important ingredient in the manufacture of the 'continental dishes' of many of the inferior London dining-rooms.

Of the forty British species, fifty per cent. have been pronounced edible. The question thus very naturally suggests itself, why are these twenty species not more sought after and esteemed than they are? The query is easily answered. British prejudice is the factor that mainly determines which shall be eaten and which not. *Tuber aestivum* is eaten, and its virtues are recognised; but the others are classified as 'poisonous,' and are rigidly eschewed as articles of diet. The same blind prejudice is evidenced in the classification of all fungi which grow above ground as 'mushrooms' and 'toadstools.' The former are edible, the latter are poisonous. The first-named includes in many persons' minds but a solitary specimen, the meadow mushroom, the toadstools all the rest. Signal failure has marked the efforts of those who have attempted to popularise the eating of British truffles other than *T. aestivum*. The elevation of the poorer truffles to the status of edibility is, alas, a difficult and almost impossible process!

Germany and Holland, Spain and Algeria, all have their respective truffles; but they are much inferior to those of their Gallic neighbours. Alexander Bornholz, a German scientist, claims to have successfully transplanted and raised French truffles. The measure of success, however, is so small that the experiment must be regarded as a failure. A French savant professes to have discovered a soil so adapted to the growth of that article that the world's trade in truffles is threatened with revolution, and we are informed that truffles will ere long be sold in Paris at the French equivalent for a penny a pound. There is a vast difference between this and sixteen shillings a pound, which is their present price. The Committee appointed by the French Académie des Sciences to inquire into the matter, will, it is feared by truffle experts, have but another failure to report.

During the year 1889, France exported 452,361 pounds of truffles, of which 204,633 pounds came to England; 107,276 pounds went to Germany; 38,990 pounds to Belgium; and 24,387 pounds to the United States. The last-named country will soon cease to be a market for French truffles, for the native varieties, it is found, are of marked excellence and wide distribution. During the past few years, a considerable amount of attention has been devoted in the State of California to the gathering and preserving of truffles. Lately, a party of Americans interested in the truffle trade went to Bordeaux and made themselves familiar with the various processes of the export industry. The canning process is extremely simple, and almost exactly analogous to that adopted in the preserving of tomatoes and asparagus. The truffles are partially boiled, then placed in the can or tin, and sealed up in their own diluted juice. 'Truffled' game is simply

game stuffed with truffles, which for this purpose are cut into small squares and inserted in the object to be stuffed.

We have already alluded to true and false truffles. The distinction between the two is so strongly marked, that there is little difficulty in detecting an imposture. All truffles, like fungi generally, are produced by minute spore seeds, which when magnified five hundred diameters appear as large as a small pin-head. In the true truffles the spores are deposited in sacs which contain from four to eight spores, and are embedded in vast numbers in the flesh of the tuber. In the false truffles the spores are free, and borne on spicules or supports. After all, perhaps, the best test of the quality of the 'most delicious product of the whole vegetable kingdom' lies in the eating of it. Even the time-honoured test, traditionally so efficacious in the case of mushrooms, of placing a silver spoon in juxtaposition with the cooking truffles, in the belief that if good the colour will remain unchanged, if poisonous it will become deep black, must be abandoned as worthless. Scientific research has, however, discovered, chiefly by the aid of the microscope, that an extension of the list of British edible fungi in general and truffles in particular can be made with safety. Those who avail themselves of the teachings of science, and regale themselves on the vegetable dainties which Nature places at their disposal, run the risk of being dubbed fungus-eaters, and classed with him of whom it was said: 'He ate strange flesh.' The opprobrium of the term, however, grows weaker as knowledge extends and prejudice wanes; and ere long we may hope to see, if not French truffles at a penny a pound, at least an increase in the quantity and varieties of English truffles exposed for sale in our market.

THUNDERBOLT'S MATE.

IV.

On the evening of Tuesday, September 8, at a quarter past six, Penelope Lees opened the double gates of the Bilbil home-paddock, squeezed through on her pony, shut and fastened the gates behind her, and rode up very slowly to the home-stead. There was a good sunset that evening—a sunset on a grand scale, for quite half the sky was tinted pink and amber; but Pen only noticed it when she stopped to give her pony its evening drink at the horse-tank, which mirrored the whole thing. Eastward, however, at the horizon, the sky was gray-edged, and the edge was growing broader; but this Pen never noticed at all. The fact is she had ridden home from the shed this evening with downcast eyes, for the shearing was all but over. It had been such splendid fun all through that it seemed to have flown over in one week, instead of in six. But what was a thousand times worse than the close of shearing was the approach of schooling; for it was settled that when William Lees went down to Melbourne at the beginning of November he was to take his little girl with him and leave her at a school there—hundreds and hundreds of miles away. This had only just been arranged;

but the arrangement was final; and it must be confessed that 'downcast' does not tell the whole truth with regard to poor little Pen's eyes on her ride from the shed this evening.

She dismounted at the stables, took the saddle and bridle from her pony, and sent him off towards the horse-paddock at a gentle trot. Then she walked slowly to the house, which, with the flaming west behind it, looked like an unambitious carving in ebony. The long bare veranda in front of the store and the dining-room telescoped, as it were, with the Cottage veranda; and before she set foot in the former, Pen could see the square screen of sunset at the far end of the latter, and, blotted like ink upon this screen, motionless figures sitting in silence.

As the child's step rang through the long, empty veranda, some heads turned in the other one, but no one spoke. A vague fear seized Pen, their motionless attitudes seemed so strange. She hesitated; but the reactionary impulse followed speedily, and hurried her forward, with faltering steps, into as queer a Quakers' meeting as could well be imagined.

In the sitting-room doorway stood Mrs Lees, drawn up to her full height, her pale face cold and proud, and bitterly indignant—but quite calm, with the composure that sometimes, at a crisis, seems to come natural to the last woman you would have expected it of. Robert Ayrton, the overseer, was spread out on the floor, his back against the weather-board wall of the Cottage, his arms folded, and his head thrown forward on his chest. The man who called himself Brown lay in his usual posture in the long chair, and his dark deep eyes were turned upwards with their usual inscrutable stare.

Seated on a chair at some little distance from them was a man whom Pen had never seen before. He wore riding-boots, spurs and breeches, a short neat jacket, and a 'cabbage-tree' wide-awake. His face was half turned to the glowing light, which shone upon a clear gray eye, the half of a ruddy moustache, and a sunburnt cheek and chin; the other side of his face was necessarily in deep shadow. The man was smoking a pipe—the smoke hung in silvery puffs upon the screen of rosy sky at the end of the veranda. Penelope advanced shyly, with her eyes fixed, as was only natural, upon the stranger. Suddenly she stood still and shivered. The red light glittered upon something bright and steely that lay in the stranger's lap—a revolver.

'Come to me, Pen,' said Mrs Lees, in a cold mechanical voice.

Pen obeyed promptly enough, and slipped an arm round her mother's waist and nestled close beside her. And Mrs Lees answered aloud—in a curiously scornful tone—the child's upward look of terrified inquiry: 'These men are bush-rangers. We are all in their power!'

Pen clung closer to her mother. 'Which men?' she whispered. 'There's only that man over there with the pistol—is he Thunderbolt?'

'Yes,' said Mrs Lees, in the same dauntless, disdainful tone; 'and the one with the broken leg (if it ever was broken)—the man that we have nursed and attended to all these weeks—is his accomplice!'

A guilty blush suffused Pen's face to the roots

of her hair. She had known this for days, yet kept it to herself! But then she had never suspected treachery of this kind. Was it treachery? She glanced to where Brown lay, hoping to find a reassuring expression on his face. But there was nothing reassuring there. His eyes were still gazing vacantly upward; but the ghost of a smile played over the pale haggard features. This faint smile seemed to Pen a confession of treachery, and she burst into tears.

At this moment, a pleasant voice, singing carelessly, broke upon their ears. The voice came nearer and nearer; then a swinging footstep and the jingling of spurs were heard in the long veranda. The bushranger handled his revolver. A moment later, the store-keeper—a young fellow fresh from England—stood aghast in their midst.

Ayrton, the overseer, raised his head.

'Throw up your hands, Miller,' said he coolly, with the true colonial drawl; 'up with them, old man, or you're a stiff 'un! We're stuck up. Let me introduce you to the celebrated Thunderbolt'—pointing to the man with the revolver—'and his mate'—pointing to Brown.

Young Miller turned pale; then he stuck his hands deep in his trousers' pockets. He was a very young man—a Rugby boy but a year ago.

'It's a bit of colonial experience for you—a bit worth having,' went on Ayrton calmly, slicing a cake of tobacco as he spoke; 'something for you to write and tell the old folks at home. Look out—you'd best stand still, I say!'

Young Miller had taken a quick step forward; but he stopped as quickly; for Ayrton's warning was driven home by the cocking of Thunderbolt's revolver.

The bushranger now rose to his feet and stretched himself coolly. 'Is this the last of them?' he asked of Ayrton.

'There's the butcher'—

'We can do without him.—Call the cook.'

'And there's the groom.'

'We won't wait for him.—Call the cook, d'ye hear?'

Ayrton obeyed. The Chinaman came.

'Tell him to dish up dinner in here—and sharp,' said the bushranger, pointing to the sitting-room.

Ayrton repeated this order as though it had been an order from William Lees.

'Now, my friends,' said Thunderbolt, addressing the whole company, 'some find me a man of few words—some t'other thing; but anyway it's precious little I've got to say now. You'll have heard of me before, mayhap; and you'll have heard of some o' the things I've done when pressed. I've done enough, I daresay, to set a pretty high figure upon myself, alive or dead. Whatever you may force me into doing to-night, it can't make it any hotter for me, when my time comes, than it would be as things stand already.' He tapped the butt-end of his revolver significantly. 'But really, ladies and gentlemen,' he went on in a more insinuating manner, 'there need be no unpleasantness at all: all I ask is a square meal: then we'll adjourn, the lot of us, and any more as may happen to drop in and join us—to the store: and after that—I don't promise, mind—but it's

very likely I'll be saying good-bye to you.—As for you, ma'rm,' continued Thunderbolt, bowing snavely to Mrs Lees, 'if you've heard anything about me at all, you'll know that *you're* safe—whatever happens—and the little lady too!'

Mrs Lees treated this assurance with silent contempt; and the outlaw now ordered them all into the sitting-room, which, as he had been careful to find out first, had no second door, and no windows beyond the two that looked out upon the veranda. The young store-keeper was the last to enter, and he turned on the threshold to shake his fist at Thunderbolt's mate.

'You villain!' he muttered savagely—'you double-dyed, immeasurable'—

Some swift momentary change in Brown's face—to which Thunderbolt for the moment had turned his back—made the young man stop short in the thick of his epithets. It set him thinking, too. And a little conversation between Thunderbolt and his mate, which now took place, made his thinking run in unexpected grooves.

'Can you walk yet?' asked Thunderbolt.

'No.'

'Where do you sleep, then; and how do they shift you?'

'I sleep in the barracks; the gentlemen carry me to and fro morning and evening.'

As young Miller, and indeed every one, knew, Brown was *not* carried to and from the barracks; he hobbled on crutches. Miller, moreover, had a shrewd idea as to where those crutches were at that moment; the creepers grew so thickly at the base of the trellis, and the long chair covered so much ground just there, that they could not quite be seen; but that they were within Brown's reach, Miller could not doubt. His ideas became almost too much for him; for none but himself had heard the small conversation between the bushranger and his quondam mate, and Miller yearned to whisper the gist of it to Ayrton, though, happily, he had too much sense to attempt this.

An hour passed. Supper was over: the bushranger had eaten heartily enough, if no one else did—and had not touched a drop of anything stronger than tea; and all the while with half an eye upon the veranda and Brown, and an eye and a half upon the room and its occupants. The number of the latter was now materially increased. After dinner had been served, Sammy, the Chinese cook, was not allowed to return to the kitchen. Then the groom had come in to say that a strange black horse was tethered in the pines, and the groom had been detained. Then the butcher had come to see what had happened to his friend the groom, and the butcher had been detained. The maid-servant, also, had surrendered of her own accord, being tired of the dust and discomfort and solitude under her mistress's bed; so she was in the room too, in a state of intermittent hysterics. But Mrs Lees sat through it all in haughty silence; and little Pen, clasping her mother's hand tightly, did her best to follow her mother's example.

'I was once in pretty much the same fix before,' Thunderbolt told them good-humouredly, though really the 'fix' did not seem to be on his side. 'It was at a Queensland station, Clermont way;

and I'd bailed up all hands in the store quite comfortably; but they were fools enough to attempt a rush, and—*how* many was it I shot, mate?' asked Thunderbolt, glancing through the door.

'Three,' replied Brown shortly. 'So you said—I was not there.'

'Ah, three: so it was: three. Now, they could only hang me once for them three. What's more, if I was to shoot three dozen more to-night—supposing there was three dozen here to shoot—still, they could only hang me once. That's where I've got the bulge, you see!'

Thunderbolt puffed his pipe complacently. He seemed enamoured of the situation, and glad to prolong it. Suddenly, however—quite suddenly—he turned to the young storekeeper.

'You sing, mister—eh? I heard you as you came along the veranda. Give us a song now.'

Young Miller, though his eyes met the bushranger's, saw a white face nodding to him through the open door; and the reluctance with which he went to the piano was only feigned. Then and there he sang, to his own accompaniment, a song that fell agreeably upon Thunderbolt's ears, but sank like lead into all other hearts, save that of Thunderbolt's mate. The song ended, the bushranger said authoritatively: 'Give us another.'

Young Miller glanced inquiringly at Mrs Lees. The circumstances had not quite robbed him of his English manners. Before the first song, he had asked permission in the same mute way, and received a nod. It was almost a pity she did not confine herself to a nod this time, for it only amused the bushranger when she said sarcastically: 'Certainly, Mr Miller. Pray, do not be murdered for the sake of a song!'

Miller struck up a lively jingle, reminiscent of burnt cork and the banjo, and straightway plunged into a song that purported to be comic. It was highly appreciated. Thunderbolt beat time with his spurred heels, joined in the chorus, and, at the end, rapped out his applause upon the door-panels with the butt-end of his pistol. He had laughed uproariously at least once in every verse, and faint echoes from the veranda had further encouraged the singer.

In high good-humour, the bushranger now asked Miller to play one of the old English ballads. Miller got out the book; and a strange scene followed. Thunderbolt—this bloodthirsty desperado—stood up, revolver in hand, and sang 'The Lass of Richmond Hill'; moreover, he sang it with excellent expression, and in a full manly voice that only just missed being sweet into the bargain. None of the party ever heard the song again without recalling his singing of it. It was greeted with loud applause from the veranda, to which Thunderbolt had turned his back while singing. The merry ruffian's spirits rose still higher, and he undertook to give 'Tom Bowling' as a wind-up.

He looked really very handsome, and taking, and good-natured, as he stood up there framed in the doorway. The light of the lamp on the table and of the candles in the piano sconces fell upon his tall athletic frame and strong regular features: his teeth, as his mouth opened—like a true singer's—in a perfect circle, were white and even; and he sang that tender old

song of Dibdin's with a rough, effective tenderness of his own; though the revolver was in his hand and his finger on the trigger!

Never before or since, one ventures to assert, has 'Tom Bowling' been rendered under such very exceptional circumstances. It occupied some minutes. Your rough-and-ready singer's tendency is ever to overdo the andante, and this one had a particular weakness for *rallentando*. So the song, which was sung much better than the previous song, took up some little time; and when it was over, there was no applause. The leader of the applause was silent. There was not a sound from the veranda. Thunderbolt turned round quickly, almost before the last note had died away, and uttered a sound that seemed to come from another throat, and a wild beast's, for it was a roar of rage. His former mate—the helpless man with the broken leg—was gone!

Thunderbolt strode out, but only a yard from the door, and stood listening and peering through the darkness. He could see nothing; he could hear nothing. Wheeling round, he stalked back into the room, livid and furious, and clapped his revolver to young Miller's ear.

'You young hound!' he yelled, 'I've a mind to blow your brains out where you sit! You've had a hand in this!'

And Tom Bowling had not been thirty seconds 'gone aloft!'

OUR DOORS.

A THOUSAND years ago an Anglo-Saxon poet wrote of the door of the hall, or house, as 'the mouth of the roomy mansion.' We have yet several of the hoary doorways of this old time; some in the 'dark and true and tender north,' some in the sunny south; others in the east and west; but the doors of them all have perished. The doorways were wrought in stone, and have endured; but the doors were made of oak or other hard wood, and have consequently decayed, though, probably, not till after many years. When, however, the poet said the door was the mouth of the mansion, he evidently meant to apply the metaphor to the doorway.

Though we have no doors handed down to us with our numerous Saxon doorways, we have many magnificent examples of somewhat later centuries. We have ancient doors of fourteenth and fifteenth century workmanship with hinges covering the whole of the woodwork, with floriated ramifications of ironwork; some others that have their original handles in good preservation, though they were already old before the Tudors came to the throne; some with the first escutcheons the clever smiths put over the keyholes when they were new; and some with the splendid and intricate locks with which they were originally furnished.

Many of our cathedrals, for instance, have preserved some of their ancient doors as well as their superbly sculptured doorways. These relics are generally in comparatively unimportant places, on account of the fact that the more

frequent use of the principal doors, over and above their more prominent positions, has led sooner to their dilapidation, and subsequent renewal. In the north aisle of York Cathedral there is a massive arch-headed door three or four hundred years old, studded all over at regular intervals with bolt-heads, and traversed across its width by two plain flat strap-like hinges. Westminster Abbey has several heavy massy iron-bound doors belonging to its palmiest days, one of which opens out of the beautiful cloisters. Ely Cathedral has a carved oaken door in the south transept which is said to have been reverentially returned to it after having been removed to Landbeach. Durham Cathedral has not only a door wrought by medieval carpenters, but the identical one, with the bold and grotesque knocker upon it, used for centuries by those who applied for sanctuary within its sacred precincts. Rochester Cathedral has a fine example in the north transept. The doorway has a porphyry column on each side of it, and on the oaken door stretch out long plain iron hinges, terminating in fleure-de-lis at its outer edge; and although we may be pondering over the pending question whether the choir-screen should be maintained in its present place or removed so that the choir may be better seen, or may have been loitering outside to view the Medway winding through the deep green meadows, or to scan the great ruined castle close by, or the circling of the countless pigeons there, this old dark recessed door has a mystery and charm that vanquishes all other impressions. There is another heavy old oaken door in this pleasant city, it may be added, in a neighbouring alley for foot-passengers from the High Street. This is chequered all over with broad strong mouldings and panels, studded evenly with small bolt-heads; and the old latch and ring first used in opening and closing it are still on it, with a general effect of sombrousness and cumber-someness that is arresting.

The Temple, London, is especially rich in old doors of several periods. There are Elizabethan doors in some of the rooms, and large floriated doors in the great Hall rejoicing in the carved foliage of Stuart times. The most interesting of all, perhaps, is a small door in the penitential cell in the thickness of the wall on the north side of the church, in which disobedient brethren were confined. The woodwork of this door has been renewed; but the hinges and catch are the same that closed on brother Walter le Bachelor, Knight and Grand Preceptor of Ireland, who was placed in the tiny cell for disobedience to the Master of the Temple, and is said to have been starved to death in it. A narrow winding stone stair leads up from the superb 'round,' where in the centre of the circle, formed by the ring of noble columns, lie four grand effigies of knights, who were perhaps less unfortunate, and passes on, up and up, past this low and massive door, to the triforium. The cell is but four feet long by two feet and six inches in width, and has but two slits looking into the church for light; and detention in it for any length of time must doubtless have been severe punishment.

One of the most interesting doors in the metropolis is in the west doorway of the church of St Bartholomew the Great, Smithfield. This opens in the centre, and is panelled into many recessed

compartments, and studded with iron bolts. It is perhaps four inches thick, and was doubtless placed there more than two hundred years ago. A door on the north side of the same time-marked fabric carries us probably still farther back, if not to the days of the martyrdoms in the great square close by. They are both chiefly noticeable, however, on account of the access they give to the noble remains of the famous Priory Church. Among dilapidated houses and the most dismal surroundings of a crowded neighbourhood, down a narrow passage, the choir end of the great church is still standing, with all the solemnity of its pillared apse and broad eastern ambulatory for processions, its mighty columns, its air of venerable grace and dignity. The sites of the Priory buildings, halls, galleries, dormitories, refectories, cloisters, butteries, pantries, kitchens, stables, and mulberry gardens, are all covered with closely-packed houses, reached by such well-known approaches as Little Britain and King Edward IV.'s Street; and these sturdy doors seem to protect from further encroachment one of the most delighting fragments of medieval London.

Public halls, as in the case of St Mary's Hall, Coventry, have some valuable examples. Besides the fine hall in which the corporation of Coventry holds its court, which is handsome with tapestry, armour, and pictures; besides the mayoress's parlour with its ancient oak chair of state and stained glass, and the great crypt and vaulted kitchen, there are many old doors of contemporary age, with enormous strap-hinges strengthening them, that form no mean part in the general picturesque result. Private mansions, too, can point to many precious specimens. In an antique hall, bewitching with step gables and mullioned windows, in Conway, there are several Elizabethan doors and doorways, the latter incised with pithy legends entreating that we should 'Bear and forbear.' One door in the north court is composed of fine sturdy planks studded all over with large nails; another opening on to a terrace is equally enriched, and large floriated hinges make them at once more enduring and more ornamental.

It is in our country churches, however, that we find the largest number. At Hickling, in Nottinghamshire, and at Little Hornead, in Hertfordshire, there are ancient church doors with richly-wrought hinges that completely cover them with ramified scroll-work; and there are examples scarcely less admirable at Caistor in Lincolnshire, Weston in Suffolk, and Staplehurst in Kent. Deep in the hearts of their respective counties, far from the towns with the improvements that sweep away so much of antiquity, and the wear and tear that destroy so much more, we come upon scores of charming old churches, patched, perhaps, with orange-coloured, or gray and green, velvety lichens and mosses, or clad with ivy and belted with yews, and approached by crumbling lychgates; and those who look for them may find, besides other treasures, such as curious pulpits with, perhaps, hour-glasses attached to them, carved stalls, grotesque gargoyles, ancient 'pues,' sculptured effigies, great slabs sealed down with memorial brasses, strong chests ornamentally bound in iron, many an olden door as full of interest as any part of the sacred pile. Let us look into Astley Church, for instance, in War-

wickshire. It is many miles from either of the grand old cosy towns, with their proud spires and tall chimneys, their bulging, overhanging almshouses, and their smart shops and modern villas, and is indeed in the silence of the green core of the park-like county. Down on the floor at the west end lie three beautifully sculptured effigies, as though they had been removed from tombs, or were waiting to be placed upon them. Two of them represent the mother and father of Lady Jane Grey; and the third, which has the small slight stature of a girl, is supposed to represent that uncrowned queen. These personages lived in the moated castle close by; and when Sir Thomas Wyatt's insurrection, in 1554, was suppressed, it was to Astley that the Duke of Suffolk came and sought to hide his head. In this church, then, they worshipped, and when the end had come, those who loved them placed these sad memorials in it. Here are eighteen old brown-black oaken canopied seats with misereres ranged against the walls; here are slabs from which the brass presentments or heraldic bearings have been plucked out; here is a panelled enrichment of the space over the chancel arch that is rarely seen; here is a winding stone stair leading up to the belfry; and here is an ancient chest for the parish books. Seeing who passed in and out of the old doorways, should we not take note of them, likewise?

Now and then we come upon doors in curious places. In very old churches we may often see a small dark door of plain oblong outlines high up in the piers of the chancel arch, leading, apparently, to nothing. Those who know, however, are aware that these seemingly inaccessible and useless doors once gave access to a narrow walk on the top of a screen or rood-loft, now removed. In communication with them will be found similar doors on the ground, unless they have been destroyed or covered over with plaster-work; and then we can see how those in charge of the sacred building and its decoration will have entered by the lower one, ascended the winding stair within the wall, and emerged through the upper door on to the footway on the screen, probably for the purpose of lighting it or decorating it. In Hinckley Church, in Leicestershire, one of these deserted doors may be seen. The light and spacious interior of this church has been stripped of many of the tokens that past centuries left with it; but this, and the fine tapering steeple, and an old chest, have been spared. In Ross Church, Herefordshire, in which we may see the pew occupied by 'the man of Ross' for so many years, both lower and upper doors have been preserved, though the screen has been removed, as at Hinckley.

It may be mentioned that on the right jamb of ancient church doorways can be detected, occasionally, a small unobtrusive cross, forming no part of its ornamentation, and only about four feet from the ground. It has been conjectured these are dedication crosses made at the ceremony when the edifices were first used. It is just as possible, however, they may have had some other origin not hitherto ascertained. One church in Sussex, at Preston, has two, one on either jamb. There are examples of one cross only in the churches at Northfleet and Barreton in Kent. We know that twelve crosses were

marked on a large stone and placed inside the church at some dedications, as in Moorlinch Church, Somersetshire, and New Shoreham Church, Sussex; but these differ, inasmuch as they are simply incised in the stonework of the doorway.

An Italian authority, Scamozzi, with the same thought in his mind as passed through that of the Anglo-Saxon poet quoted, laid down as a rule that a door should be in the centre of the front of a building, just as the mouth of an animal was placed in the middle of its face; and the great Italian architects of the Cinquecento period seem to have agreed, too, that the proper proportions for a door required that it should be twice the height of its width. Modern builders are all of the opinion that doors should open inwards, lest they strike those who would enter by them in the face; but it is not so clear that they agree in points involving more costliness. It is certain, however, that whether looked upon as mouths or not, all of us must admire the doorways handed down to us by the skilful workmen of successive centuries, the simplicity and honesty of the Saxon work, the zigzag and other beautifications of the work of the Normans, the use of polished columns in later years, at first singly, and then clustered, and afterwards with tiers of sculptured figures in their interstices; and still more the rarer instances in which the work of our old carpenters has been preserved for us in our ancient doors.

SAFE No. 27.

By CARROL KING.

It was some time in the early eighties, I was appointed agent for Rawlin's Bank, at least for the branch of it located in the busy seaport town of Keppelwade, on the Yorkshire coast. I was graciously informed by my superiors, the Rawlin Brothers, principals of the Bank, that my trustworthiness and punctuality had induced them to promote me to this post at an earlier age than bank clerks usually blossom out into inspectors or agents. I thanked them deferentially, but adhered to my own previous private opinion, which was, that I was indebted for it partly to the influence of my uncle, Sir Gilbert Varcomb of Keppelwade, and partly to the adventure which I am now about to relate.

The agent under whom I had qualified for my present position was John Seaton, a canny old Scotchman, slow as the tortoise, but of exceeding kindness and faithfulness of heart. To know him was to love him. He and I both lived in the Bank House, just above the business premises, which were large and commodious. It was a substantial and imposing mansion, built of red brick, with stone facings, and polished granite pillars. The whole of the ground floor was required for business purposes, besides a large portion of the cellarage. A side entrance as handsome as the other led up to the first floor, where the agent lived. On a higher story I had my bedroom and sitting-room; and I lived contentedly on the premises, finding plenty of

healthy amusement and variety in fishing, shooting, even occasionally riding after the hounds, when my uncle, Sir Gilbert, gave me a good mount, and various dinner and evening engagements in their season.

There was a beautiful little place belonging to my uncle, called 'The Cedars,' within a mile of the town. It was tenanted by a retired Indian officer, Colonel Gower, his wife, and daughter, Miss Eleanor Gower, a very handsome girl, but cold and stately in manner. Shortly after they took possession of the Cedars, about a twelvemonth before my story begins, Colonel Gower and his daughter drove into town, and stopped at the Bank, where they both alighted and entered, the Colonel bearing in his hand a large brown leather bag. I went with them to the manager's room, as Mr Seaton was out, and Colonel Gower opened his business to me without any hesitation.

'I have here,' he said, laying his hand on the bag, 'many thousands of pounds' worth of jewels. My daughter's godmother, Mrs Haseldine, a very wealthy and eccentric woman, died recently, and bequeathed all her jewels to Eleanor—more trinkets than a reasonably sane woman could wear in a lifetime. We have brought them to you for safe keeping.' He set down the bag on the table with a heavy thud.

I explained to them quietly the precautions we took for the defence of such valuables.

'I will give Miss Gower a written code or cipher that will be known only to her and me—and, of course, Mr Seaton. She must give an order in her own handwriting to any messenger—even you, Colonel Gower, bearing the half of this cipher on its face before any of the jewels are delivered. The key of the safe in which they are kept?'

'One moment, please,' interrupted Miss Gower. 'I will retain only one key—that of the leather jewel-case inside the iron box.'

'As you please,' I assented. 'If you let me see them now, I will catalogue them, and make a copy-inventory for you to retain.'

I looked into the front office to tell the clerks that no one was to be admitted to the manager's room except Mr Seaton if he returned; then I locked the door and sat down to my task. The Colonel opened the bag and disclosed a strong-box with iron clamps, marked with a large 'H,' in brass-headed nails, on the top. Miss Gower handed him a key, and he opened this also. Inside was a strong leather jewel-case, and of that, too, Miss Gower gave him the key.

We had many beautiful and valuable family jewels in trust; but anything like these now revealed I had never seen. Rubies of rich intoxicating lustre; flawless pearls, opals, emeralds; but the diamonds were the especial glory of the collection, filling the dull room with fairy sparkles of light, like the ripples on a sunlit bay. Starry clusters of diamonds for the breast, coronets of lesser stars for the hair, necklets, pendants, brooches, clasps, lockets, eardrops, without number! And besides all these in their rich settings, a little chamois bag under the lowest tray, lying beside a set of magnificent and very ugly cameos, held a number of unset and smaller diamonds. I worked rapidly, laying each article when catalogued on a velvet-lined tray. When the long

list was finished I read it over; the Colonel replacing each piece in the case as I named it; then, before taking a copy, I put my list carefully into a secret drawer of the desk and locked it.

'Now we will put this iron box away first, for it is not safe to leave the gems even for a moment. Come this way, please.'

I left the agent's room by a door that gave on the corridor, and they followed me to the strong-room, a separate building, burglar and fire proof, lit by electric light. This strong-room had been designed by a celebrated engineer; none but skilled artisans, with time and appliances, *and noise*, could break through from without or from below. The lock of the iron door was a special patent, opened by only one key, and that key never left Mr Seaton's possession, or, when he was absent, mine. I explained all this to Miss Gower as we entered the vault, where light burned day and night, and strong safes held priceless deposits.

'This will do—Safe No. 27,' I said, stopping before one. I opened it with the key on my bunch that bore the corresponding number, and placed the iron box inside, taking out the key of the box.

'Now,' I explained, 'I shall connect an alarm with this safe that will ring both in my room and Mr Seaton's if it is tampered with, so your treasures are quite secure, Miss Gower.'

After that day the jewels lay undisturbed for months, except that Miss Gower occasionally brought a friend to admire them, when John Seaton or I brought the iron-clamped box to the manager's room, and remained beside the gems until they were restored to their strong-hold.

The winter wore uneventfully away, the spring passed, and then a slight stir came even to Keppelwade, for the two or three hotels began to fill with summer visitors, who were finding out the beauty of our secluded hamlet and its sunny bay. Among others came a young Anglo-German, who brought letters of introduction to Colonel Gower from various old friends abroad and at home. He told us he needed rest and quiet, and Keppelwade had been recommended to him for its salubrious air and seclusion. He was a handsome man, of brilliant parts, with a wonderful fascination of manner. Colonel Gower did not invite him to stay at the Cedars; he took rooms at the *Windsor Hotel*, and made himself free of the whole town, captivating all and sundry by his good looks and his kindly affable manners.

A polished, widely-travelled man of the world was John Hessel, and he could converse with equal ease and brilliance on literature, science up to date, ethics, or metaphysics. In a week or two he was as much at home in Keppelwade as if he had been born amongst us, and his face became as familiar at the Bank as that of old John Seaton himself.

Mr Hessel was a profound believer in mesmerism, and told us some strange tales of 'subjects' he had seen abroad, in Paris and at the German seats of learning, where at that time 'metal baths' and mesmerism were the prevalent craze. He told us with a laugh one evening at Sir Gilbert's, that when all other means of living

failed him, he could become a Professor of Phrenology and a mesmerist. 'Few,' he said, 'could resist his influence.' Sir Gilbert proposed a 'mesmeric entertainment,' but Mr Hessel rather haughtily refused.

I dreaded the influence he might establish over Eleanor Gower; but when I saw no special preference on either side, I became content to wait, patiently and quietly as before, until time or circumstance favoured my own suit. I thought my case was not hopeless. I was heir-presumptive to Sir Gilbert Varcomb, and had a good allowance, besides my salary; and I had no expensive tastes; so I thought it was not unreasonable to hope that I might win Eleanor Gower for my wife some day. Meanwhile, the months passed; other visitors came and went—John Hessel remained.

One evening I was dining with him at the *Windsor*, and our conversation had turned, as it often did, upon mesmerism. He seemed to like to talk of his own powers, and he reiterated his often expressed belief that I was one who would fall a ready victim to his will-power. I knew he was mistaken, for many 'professors' to whom I had freely offered myself as a 'subject' had given me up as impracticable and quite unmanageable; but when Hessel still persisted in his opinion, I agreed carelessly to a trial of his skill. I could do no less when he—my host—was so evidently in earnest, and seemed even a little nettled at my unbelief.

I sat in an easy-chair, and fixed my eyes on his face. He made gentle passes before me with his hands—strange rhythmic movements that, but for fear of annoying him, would have made me laugh outright. Suddenly, with an inward laugh, I resolved to feign the mesmeric sleep; I thought of nothing beyond the passing fun of the moment, and I would turn the tables on him when he began to boast of his power, or gift as he called it. Again, I say, I thought of nothing beyond this. I allowed my eyes, under his steadfast gaze, to become narrower and milder, then the lids drooped slowly, and I fell back limply in the chair and breathed gently and regularly. There was perfect stillness for a few moments, and then I heard a muttered 'That's well!' uttered with an intensity that filled me with curiosity. About five minutes passed, and then he said gently: 'Varcomb, can you hear me?'

'Yes,' I replied, in a dull mechanical way.

'Where are Miss Gower's jewels kept?' he asked in a low eager tone.

It was a wonder I did not leap to my feet, in my great astonishment, and a good thing that I did not. I found voice enough to say in the same dull manner: 'Safe No. 27.'

'Can you obtain access to it—to them?'

'No.'

'Why not?'

'John Seaton holds the keys.'

'How is the vault protected?'

'Night-watchman, big dog, iron door, electric alarm.'

A very unorthodox execration broke from him; and there was a lengthy pause, during which I dared not move a single eyelid.

'How shall I obtain access to Safe No. 27?' he asked at last.

'You must have a written order from Miss Gower, headed by a code or cipher, known only to her and Mr Seaton.'

Again a baffled ejaculation, and he rose and walked about the room, muttering angrily.

I sat motionless, ruminating deeply on my idiotic answers. Some ready-witted men could have coined misleading answers to Hessel's questions without hesitation; I was not one of those who cannot be taken by surprise. I *had* been taken by surprise. How I longed to be alone, to think this well over. A few minutes more, and I felt that he was making rapid passes before my face again.

'Wake up,' he said sharply; and I started up quickly, rubbing my eyes, and looking, I dare say, dazed and stupid enough. He was looking at me earnestly.

'You don't make a very good subject, Varcomb,' he said lightly. 'Confess, now, that you have been half awake all the time, laughing at the ridiculous questions I asked.'

'You are quite mistaken,' I replied truthfully, and with a great yawn. 'I was not even half awake! That I should live to say it, who never believed in mesmerism, except among a parcel of weak nervous women!'

'Come out for a stroll along the shore,' he said quietly. 'It is a pleasant evening.'

We went out together. It was a gray, quiet evening; gray clouds cast leaden shadows on a slate-coloured sea.

We strolled along the breakwater, and met an officer of the coastguard, who gave us the interesting information that a bottle-nosed whale had been seen in the offing. We stood talking with the man—I was determined not to hurry—and then we turned back with him, discussing the probable capture of the doomed whale.

Hessel asked jestingly if I would not go out to cast a harpoon with the fishermen, and I replied with a laugh: 'Yes, if he would insure me against the fate of Jonah!'

I passed a sleepless night, thinking over the whole situation. It was impossible to avoid the conclusion that some danger menaced Miss Gower's jewels, yet it was at present so intangible, that I could not make up my mind to take any one into my confidence. I was not afraid of an attack upon the vault; it was too strongly guarded. I could only think of one plan by which I could insure the safety of the jewels, and to follow out that plan might place myself in an awkward predicament. I resolved upon it, however, and waited my opportunity. The first time old John Seaton went away for a few hours, leaving the keys with me, as usual, I went to the vault, straight to Safe No. 27. I took out the iron clamped box, opened it, and removed the leather jewel-case, of which Miss Gower alone held the key. I put a small letter-weight or two in the box, and filled it up with copies of old deeds, receipts, and such worthless documents. I replaced the box in safe 27, and locked it carefully. The leather case I took up to the second floor, to my own room, deposited it in a strong little box of my own, and *that* in the bottom of my wardrobe, which was always locked securely. The event proved that I was right; but I positively tremble still to think how easily I might have been arraigned as a

thief, had the jewels been found in my wardrobe.

About a week after I had transferred the leather case to my own keeping, John Hessel came into the Bank, fresh and smiling as usual. After his pleasant and courteous greetings, he presented to old John Seaton an order written in Miss Gower's firm handwriting, bearing on its face the half of the secret code, and requesting that the iron box containing Miss Gower's jewels be given to bearer—they would be returned next day. I saw Mr Seaton referring to his private ledger to verify the code, smiling the while at an amusing episode Hessel was relating in his gayest manner. I could scarcely contain my uneasiness. What if Hessel had the key of the leather case, and should wish to open it there? What if all were being done in good faith, and he should really convey the box safely to Miss Gower?

After a short absence, Mr Seaton returned, bearing the iron box, which he wrapped up in brown paper, passing a strap round it for easy carrying. He detached the key from his own ring and handed it also to Hessel.

'See you at Sir Gilbert's to-night, Varcomb,' called out Hessel gaily as he was passing out with his prize. I only nodded in response; in truth, I was almost incapable of speech without betraying my deep anxiety. The torture compressed into the next two hours was indescribable; kind old Mr Seaton told me to go up-stairs and rest—he was sure my head was aching badly. I only shook my head, and worked on desperately, for I must be on the spot when Colonel Gower and his daughter would come in to denounce the thief who had stolen the Haseldine jewels! I did not even go up to lunch, but made old Martha our housekeeper bring me some biscuits and cheese and a glass of milk. When three hours had passed without any alarm being given, I went to the other extreme of feeling, and could have capered like a madman in my joy and relief, for I was pretty sure then that my vague surmises had proved correct. When we put up our shutters for the day, the strain on my nerves had really brought on a violent headache, and, after partaking of some tea and a strip of toast, I was glad to lie down in my room and sleep, which I did soundly for two hours. I awoke refreshed and thankful, dressed for dinner, and set out for Sir Gilbert's with a light heart. I would allow the affair to develop naturally now when I knew the jewels were safe.

The kind old manager smiled and nodded to me as I was passing out, and told me to enjoy myself.

Colonel Gower and his daughter had arrived before me. I found both in my aunt's drawing-room when I entered.

'Have you seen Mr Hessel, Bert?' asked Lady Varcomb. 'We are waiting for him.'

'Not since morning,' I replied. 'He came to the Bank at eleven o'clock on business.'

I made my way to Miss Gower, as I generally contrived to do within five minutes of entering any room where she was present.

'Did you show Mr Hessel my jewels to-day?' she asked, after our greetings were over. 'He wished particularly to see those large ugly cameos, in their old-fashioned gold setting.'

'Mr Seaton gave him the iron box, after read-

ing your order, and he carried it off with all its contents,' I replied quickly.

She slightly raised her eyebrows, more in amused surprise than alarm. 'He had not my authority for such a proceeding,' she said quietly; 'nor had Mr Seaton.'

'In what terms did you couch your order, Miss Gower? Mr Seaton is rigidly exact.'

'Not quite in this case,' she pointedly persisted. 'I asked Mr Seaton to show Mr Hessel all my jewels; and I enclosed the key of the leather case, to be returned to me immediately. You showed them to my aunt, Mrs Gower of Hardwicke, a few months ago, when I could not go with her at the time, and you brought me back the key yourself, Mr Varcomb.'

'Very true; but I heard nothing of a key this morning; and Mr Seaton is so precise and correct that I am certain he has not exceeded his instructions, as he understood them. I assure you, Miss Gower, that'—

I was interrupted by a movement of the company towards the door; and after a confirmatory nod from Lady Varcomb, in response to my inquiring glance, I offered my arm to Miss Gower, and we joined the procession, of which Mr John Hessel did not form a part.

'How does this matter strike you, Mr Varcomb?' asked Miss Gower in a low tone, when we were surrounded by a subdued hum of voices at table.

'Well—I can scarcely offer an opinion as yet,' I answered; 'but I think it should be looked into, straight in the face, and at once, Miss Gower.'

We did not again allude to the subject; but when we were all once more in the drawing-room, I saw that she contrived to have a few moments' speech with her father, and I saw him glance towards me with a look of uneasy perplexity. He approached me a little later, and whispered under cover of a noisy duet on the pianoforte: 'Try to leave when we do, Varcomb; I must speak with you.'

Truly, the repose and self-control that 'stamp the caste of Vere de Vere' are beautiful and admirable in themselves! This father and daughter knew that the fate of a large fortune hung trembling in the balance, yet they smiled, conversed, enjoyed, with high-bred ease and unmoved composure. They left early, and I accompanied them. We drove straight to the Bank, and told John Seaton, who, in great surprise and consternation, sent me down to the cold empty offices for Miss Gower's order, which I found filed with others in the manager's room. He read it aloud, and then handed it without comment to Miss Gower, who looked astonished.

'It is my own handwriting,' she said; 'and yet I never wrote that! I never mentioned either "to-night" or "to-morrow" in my note.'

'You see that I acted only on what I believed to be your instructions, Miss Gower,' said John Seaton. 'I cannot yet believe that an actual robbery has been committed.—Varcomb, will you not go up to the *Windsor*—it is not quite eleven—and ask for Mr Hessel?'

'And I'll go to the Cedars,' cried Colonel Gower eagerly. 'He may have left the box at our house since we left there. I, too, feel unwilling to believe that John Hessel has really taken

the jewels—appropriated them—stolen them, in fact.'

I sped away to the *Windsor Hotel*, hoping Miss Gower would remain with John Seaton until my return—hoping, also, that the fretful invalid mother might not appear on the scene, to precipitate my confession with her jeremiads. As I expected, they had not seen Mr Hessel at the *Windsor* since the early forenoon, and he had paid his bill, as he did punctually every week, the evening before. I went back with this news to the Bank House. Miss Gower was still there; and within a few minutes of my return her father came in, triumphantly brandishing a letter. 'This came for you, Eleanor, by the evening post. I have no doubt Mr Hessel explains all satisfactorily.'

Eleanor took the letter with some eagerness, and read aloud:

DEAR MISS GOWER—I have at last attained the object to which I have devoted months of patient waiting—the Haseldine jewels. They are mine by right, not yours; for I am John Haseldine. I am sorry to deprive you of them, but they are certainly mine.

JOHN HASELDINE.

The others turned bewildered looks on each other; but I, with the knowledge of that leather jewel-case safe in my wardrobe up-stairs, pictured the cool scoundrel's collapse on opening and searching the iron box, and laughed aloud. John Seaton looked at me reproachfully; visions of Scotland Yard detectives on the trail, commotion among the Rawlin magnates in the City, possible reprimands and severities, were evidently passing before his mind.

Colonel Gower was intensely angry, and no wonder, at the cool manner in which we had all been hoodwinked.

Miss Gower looked coldly and proudly at me, as if my laugh had hurt her.

'What will he deserve at your hands, Colonel Gower,' I asked, 'who will restore all the jewels, without one amissing? Would you let him name his own reward?'

The Colonel looked at me grimly from under his shaggy eyebrows. 'Yes; I would let him name it,' he replied with emphasis.

'And if he named that which was promised to Schiller's Diver?' I persisted boldly, though my face had grown very hot.

He looked at me still more grimly, but with a twinkle in his eye, which I interpreted favourably. Miss Gower and John Seaton were talking together, and had not heard us. 'I should say,' he answered deliberately, 'that he had better ask the princess herself.'

'So he will,' I said gladly. 'Listen, then, to my small story, Mr Seaton.—Sit here, Miss Gower; I have something to tell you. We all know how John Hessel believed in himself as a mesmerist. His power was real, but his mistake was in being so sure that he could influence all and sundry. I knew he could not hypnotise me; but he was so eager to try, so determined to succeed, that, for fun, I feigned the coma, and made him think I was wholly overcome. All his questions related to Miss Gower's jewels. He had hoped to get them directly from me, and when he found how strongly they were guarded, he was

angry. I acted so well that he never found me out; and, Mr Seaton, the day you went to Harper Henge last week, I took the leather case out of the iron box, filled up the box with one or two paper-weights, and bundles of old balance-sheets and receipts.—Your jewels are quite safe, Miss Gower, in a box in the bottom of my wardrobe up-stairs.—Take my keys, Mr Seaton, and see for yourself.'

In a moment John Seaton and Colonel Gower were bounding up, three steps at a time. I stayed Miss Gower when she would have followed: 'Miss Gower—Eleanor, I am quite content to owe your father's consent to his gratitude, but—what do *you* owe me? *Not* gratitude, I hope. Love is worth love.'

I will not record her answer; it was satisfactory.

The lock of the leather case had to be forced, but the jewels were intact; not one was misplaced.

We have neither seen nor heard of John Haseldine since then; but Eleanor and I often say we *should* like to have seen his face when he examined the contents of the iron box so long and carefully kept in safe No. 27!

A NEW TASMANIAN TOWNSHIP.

ZEEHAN is a recently formed township and mining centre in the county of Montagu, on the west coast of Tasmania. When, in 1642, Abel Janszoon Tasman was despatched from Batavia by Anthony Van Diemen, the Governor-general, and the Council of Netherlands-India, on an expedition having for its object the discovery of the reported Great Southern Continent, the first land he sighted, after leaving the then Dutch colony of Mauritius, proved to be the west coast of Tasmania. This land, discovered on the 24th of November 1642, appeared to be mountainous and clothed with dark forest, and in these respects differed from the low sandy shores ascribed to the Great Southern Continent by previous navigators. Recognising it as a hitherto unknown territory, Tasman named it 'Anthony Van Diemen's Land;' and to the most prominent summits first visible he gave the names of the two ships *Heemskirk* and *Zeehan* ('Seahen') which comprised his expedition.

Mount Zeehan, thus discovered and christened two and a half centuries ago, remained until the last decade an absolute *terra incognita*. Though no more than ten miles distant from the western shores of the island, approach towards it, either from the sea-board or from lands lying north, east, or south, was, until lately, almost impracticable, by reason of the impassable nature of the country—alternating with hill and swamp, covered with dense forest and scrub, or equally impenetrable button grass.

In 1884, Frank H. Long and William Johnstone setting out from Mount Bischoff to prospect for tin or gold, entered the district around Mount Zeehan, and discovered silver-lead ore in great abundance; but the news of this discovery was disseminated slowly. In March 1885, two proprietary companies had established themselves on the Zeehan silver field.

In March 1888, an extent of country measuring north to south six to seven miles, and east to west two to three miles, had been proved to be silver-bearing; and at the close of that year twenty-five thousand acres had been let on lease by Government as mining claims of forty to eighty acres each. Owing to its inaccessibility, only seventy men were then at work on the field. The Colonial parliament at this time voted a preliminary sum for the survey of a railway to connect the field with the port of Strahan, on Macquarie Harbour, twenty-nine miles distant. This railway was practically completed at the close of 1891.

In March 1889, the population of the Zeehan field scarcely exceeded one hundred. In September 1890, it was estimated at two thousand; and at the close of 1891, at not fewer than seven thousand persons, ranking then as the third town in Tasmania.

The township of Zeehan was formally incorporated in 1891, and the erection of hotels and public buildings has proceeded with great rapidity. A tri-weekly newspaper was started in Zeehan in October 1890; and in October 1891 it became a morning daily, with a daily evening issue as well.

According to the Report of the Minister of Mines on 30th June 1891, the mining claims leased around Zeehan extend over a tract of country from Mount Zeehan north-eastwards for a distance of about twenty miles, with a breadth of about eight miles, and an area of eighty-seven thousand acres. The geological formation of the district proves it to be of Silurian age. In the northern part of the field, around Mount Dundas, carbonated ores of lead are principally found, while around Zeehan, galena is the predominating mineral. Both of these are very rich in silver. The first five hundred tons of galena ore from Zeehan, received in this country during 1891, contained sixty-six per cent. of lead and one hundred and ten ounces of silver per ton.

TO A SNOWDROP.

LOVELY little Snowdrop,
Lifting thy fair head,
Fearless of the rough winds
Sweeping o'er thy bed,
Thou art like a snowflake white
That hath blossomed in the night.

Precious little Snowdrop,
Sprung from Nature's breast,
Like a bright hope breaking
On a heart oppress;
As a star that shines on high
Through the dark waste of the sky,

Rising pale, yet steadfast,
With a cheering ray,
Just before the dawning
Of the Spring's bright day;
Then to fade and be forgot,
When the glad earth needs thee not.

OLD MAIDS.

By MRS LYNN LINTON.

THE changes which have taken place throughout all our social life have touched, *inter alia*, our estimate of Old Maids, and we are leading back to sentiments much older than ourselves. Until quite lately old maids were the recognised butt for all those smart wits who can say a sharp thing on a well-worn theme and send an arrow through a space already cleared. Like the traditional stepmother and the typical mother-in-law, the old maid was a kind of moral Aunt Sally against whom any one might have a shy—with the greatest applause given to him who most successfully battered the dishonoured old face. All the evil-speaking, lying, and slandering—all the malice and uncharitableness of society—was humped on to the shoulders of the old maid; and Utopia was nothing to the Arcadian peace that would abound were she out of the way.

As Miss Prue or Miss Tabitha she was credited with casting sheep's eyes at the curate on her own account, while she flounced out against Miss Julia or Miss Maria for attracting the attention she coveted. She was supposed to be an old maid by the mishap of fortune and the necessity of fate—not of her own deliberate will; and to be ever awearying for the husband who had evaded her clutches. All the respect paid to the Vestal Virgins of old time and to the Spouses of Christ in Catholic countries, was like so much water run into sand when dealing with the old maid of a generation or two back. A nuisance to her family, whose children she frightened by her severity, whose young wives she bullied and at whose young men she sniffed, with her nose in the air and her eyelids over her eyes—she was sure to be ill provided in this world's goods, and on the hands of the more generous, to be helped along the thorny path of impecuniosity. But she was also just as sure to tell her intimates queer tangled tales of 'undue influence,' if not darker things still, by which it came about

that the stream of the family Pactolus had been diverted from her holding in favour of those others, and that if all came to their rights, it is not she who would be the worse off! For this kind of old maid, as fancy painted her and shallow smartness repeated, had no more gratitude than she had charm; and it was one of her most striking characteristics to bite the hand that fed her and speak evil of those who did her most good.

An encumbrance to her family, she was a stumbling-block in society—a nuisance and a danger. She made up all manner of evil stories and then propagated them as 'reports.' She saw harm in the most innocent matters, and allowed no one to be beyond or above censure. But her enemies were even with her here. To them her propriety was pruriency, her modesties were pruderies; she made evil where none existed, because her own mind was always dwelling on undesirable things, and it was an insult to virtue to call her thoughts by that name. The fountain-head of all mischief, she not only slandered her own sex and vilified the other, but she was the originator of all the quarrels that divided society, as society always is divided in country places. To her, and to her malevolent gossip, could be traced the starting-point of the bitter stream that swelled and flowed till it parted kinsmen and friends never to be reunited. So at least they said who drew her portrait on the lines we have indicated, and who found that the old maid was the cause of all that went wrong—as surely as that Tenterden steeple is the cause of Goodwin sands! Nursing her cat, over whose sleeping back she every now and then caressingly bends her lean form and lank ringlets—knitting some gray or mustard-coloured abomination which would make an artist despair of her salvation—sitting by the little side-window whence she can see all that comes up and down the street, and taking note of all she sees with a view to future reproduction, she was the hateful being of literature and romance—the living representative of the wicked fairy of the nursery come back as an English-

woman in the twenties and thirties. Yet she was the direct descendant of the Vestal Virgins to whom men could not pay too great honour—the human presentment of the shield-bearing Pallas Athene, and of the silver-bowed huntress, to whom sweet young Athenian maids were wont to dedicate themselves till the day came when they made oblation and carried sacrifice to the still dearer altar of Anadyomene the Foam-born. This was the old maid of fifty or sixty years ago. And now the thaumatrope has spun round the contrary way, and for that picture we have this.

By the grace of Providence released from that close attendance on husband and children to which her duties bind the wife and mother, the unmarried woman—we do not call her old maid in these days—has all her time to devote to the good of mankind in general and the fit conduct of parochial affairs in particular. In these last indeed she is the clergyman's right hand, and simply invaluable, bearing the heavy end of all those sticks by which the spirit of evil is to be beaten out of bounds, and poverty and vice are to be fenced off from the lots. It is she who looks after the various clubs wherein women put their pence to draw out shillings in the shape of coals, boots, and blankets. It is she who takes the management of the 'baby's basket' which goes the round of the poorer sort of mothers as a loan for the first month's existence of the 'little stranger.' When the Christmas decorations of the church are on hand, she takes the most important parts, and works out the panels with as much taste as Nature has bestowed on her; and when the harvest-dress is needed, her flowers are the most lavish and her apples have the ruddiest cheeks. Probably, not what the world calls rich, she always secures a margin for benevolences, and on her modest pittance does more in bulk—how much more in proportion!—than those who count pounds to her shillings. How she manages these generousities is her own secret, for she never looks shabby, and in none of her surroundings is there the faintest mark of sordid poverty. To be sure, her scale is to the last degree circumscribed, but on the basis of that scale she does well. She lives in a small cottage like to that which the Squire's coachman and his wife have taken; but how different the one is from the other! Miss Anna's is neat as a new pin and as bright as silver all through; and what with the pretty trifles she has made with her own hands, the curtains she has embroidered, the dainty bits of fancy-work she has elaborated, her judicious admixture of colour, and here and there a more solidly valuable relic, preserved from the general dispersion of the family goods, her house has all that appearance of care and taste and neatness which goes to make 'a lady's house.' The coachman's, on the contrary, is just a working-man's cottage, no more; and no one would believe the two to have been built on identically the same plan.

The unmarried woman on a higher rung of the social ladder, and living in a wider world, is just as useful in her own way as her self-sacrificing but more circumscribed sister of the village. She is a kind of supplementary mother, always to be relied on by her friends when they have a cold, a headache, or are only lazy, and their daughters want to go to this ball or that theatre, and have no chaperon to take them. Then

that good-natured Miss Mater is only too happy to be of use; and, placidly renouncing her own fireside, bravely faces frost and fog, snow and wind, that her young friends may dance themselves tired and footsore, or cry their pretty eyes out over some fictitious sorrow on the stage, of which the heroine forgets the strain of her personation in a solid supper of beefsteak and porter.

Miss Mater, indeed, is a very godsend to her young friends all through. They will confide to her what they dare not tell their own mother; and she has the threads of more little dramas than one in her kind and capable hands. It was she who prevented young Frank from making a fool of himself about that silly Laura Fourstars, who was at the least ten years his senior and in no way his fit match. Past thirty, the standing toast and *passée* belle of a garrison-town, with not a single sixpence of dowry, and he a young fellow with all his life before him and his profession yet to choose—what kind of millstone was that which he wanted to tie round his neck, and would, but for the judicious conduct of Miss Mater?—far more judicious than his own mother's would have been! For she would have taken the thing too much 'on the cross;' and in all probability by her very efforts to detach her boy's affections would have riveted them all the closer to this very undesirable person, whom she would have vilified beyond reason. By this unreasonable vilification she would have set Master Frank's callow chivalry in arms, and made his folly a test of his high-mindedness. But Miss Mater went to work much more wisely as well as warily. She might have been a descendant of that 'Mitchell Wylie,' who in truth seemed less of a Scotchman in intellect than the Machiavelli of whom this was the perverted name. She made no overt opposition—though she demurred a little at Laura's age, which Frank averred to be only two years beyond his own, and that you know is a mere nothing—but which she brought irrefragable proof to show was ten years over his. She asked the two turtle-doves to dinner; but she asked at the same time that hideous little cad Brown Jones, who had more money than he knew what to do with, and less brains than falls to the lot of most on the outer side of Earlswood. Him she had already primed with artful praises of Miss Laura Fourstars—Miss Laura herself she had yet more artfully primed with assurances of Brown Jones's admiration. The bait was too tempting. Laura rose to it, and swam away with it in her mouth; and that poor deserted fish, Master Frank, was saved from what else might have been his ruin and would in any case have been his obstruction. He was quit of his millstone for a week's mooning and a violent headache; and Brown Jones deserved nothing better than what he got.

So with the girls. She sees all that goes on more clearly than the mother herself; and advises, encourages, or puts a stop to these nascent affairs—as she knows so well how to do and as she does so well! When under her wing nothing undesirable goes on, and the detrimentals, however fascinating, are firmly discouraged. She has no illusions for her own part, and she knows that those which the girls may have will wear themselves out by time and use, till only the coarse texture of the groundwork will be seen. Love

in a cottage appears to be more than delicious! The roses and honeysuckles and the nightingales in the trees all sound paradisaical. But when the real prose of the thing has to be reckoned with—the washing done at home—the scanty service—the anxious contrivances how to make the remains of that leg of mutton last yet another day—the calculations of whether this pudding costs more than that, and the tremendous importance given to an extra couple of eggs—and all that for a girl with carriages and horses and men-servants and maid-servants at command, and never the need of considering expense! No! the unmarried woman, clever, shrewd, and kindly Miss Mater discounts it all, and the detrimental with the bower of roses and the nightingales, is, as has been said, politely but firmly discouraged. Hence the mother proper has no need to fear when she confides her girls to the care of this mother vicarious; and no one comes to grief through her negligence or weakness.

As the unmarried sister of a family how ineffably useful is she whom it was once the fashion to sneer at as an old maid! Whenever she is wanted, there she is, and her married sisters and brothers often say they do not know what they would do without her. She is at the bedside of the sick, and she takes the place of the governess when this young lady goes home for her holidays. When the parents of any of these young broods wish to go abroad together, and thus renew their love-time by a second honeymoon, the unmarried sister goes down to their place to keep house and look after the children till they return. She passes her blameless life in active service now of one kind and now of another. Friend, helper, and adviser of so many others, she has no time to brood over the disappointments which may have desolated her own youth; and less inclination to find a bitter solace to her pain in ill-feeling and ill words against the more fortunate and the younger. She does not slander and she does not gossip; she invents no malevolent stories and propagates no cruel reports. Free from the bonds of duty, she is all the more tied to those of affection, and voluntarily gives what she is not bound to bestow. She is a grand and lovely feature in modern society and the home—and what, pray, would become of the aged father or mother without this old maiden daughter to care for them and watch over them?

THE IVORY GATE.*

By WALTER BESANT.

CHAPTER X.—A MYSTERIOUS DISCOVERY.

On Monday morning the Unexpected happened. It came with more than common malignity. In fact, nothing more threatening to the persons chiefly concerned in the calamity could have happened, though at first they were happily spared the comprehension of its full significance.

There is a wide-spread superstition—so wide that it must be true—that at those rare moments when one feels foolishly happy, at peace with all

the world, at peace with one's own conscience, all injuries forgiven, the future stretched out before like a sunlit peaceful lake, some disaster, great or small, is certainly imminent. 'Don't feel too happy,' says Experience Universal. The Gods resent the happiness of man. Affect a little anxiety. Assume a certain sadness. Restrain that dancing leg. If you must shake it, do so as if by accident, or as if in terror—for choice, shake it over an open grave in the churchyard. Stop singing that song of joy; try the Lamentation of a Sinner instead. So will the Gods be deceived. Above all, never allow yourself to believe that the Devil is dead. He is not even asleep. By carefully observing these precautions, a great many misfortunes may be averted. If, for instance, George had gone home soberly on Sunday night instead of carrying on like a school-boy in playtime, obviously happy, and so inviting calamity, perhaps he would never have been connected—as he afterwards became—with this disaster.

You have heard that Mr Dering was a man of method. Every morning he arrived at his office at a quarter before ten: he hung up his coat and hat in a recess behind the door: he then opened his safe with his own hand. Checkley had already laid out the table with a clean blotting-pad, pens, and letter-paper: he had also placed the letters of the day upon the pad. The reading of the letters began the day's work. The lawyer read them, made notes upon them, rang for his shorthand clerk, and dictated answers. These despatched, he turned to the standing business. This morning, with the usual routine, he was plodding through the letters of the day, taking up one after the other and reading half mechanically. Presently he opened one and looked at the heading. 'Ellis and Northcote,' he said. 'What do they want?' Then he suddenly stopped short and started. Then he began the letter again, and again he stopped short. It was from his brokers in the City, and it recommended a certain advantageous investment. That was not in itself very extraordinary. But it contained the following remarkable passage: 'You have made such great transfers and so many sales during the last few months, that you have probably more profitable uses for money in your own business. But if you should have a few thousands available at the present moment, it is a most favourable opportunity'—

'Great transfers and many sales?' asked Mr Dering bewildered. 'What transfers? What sales does he mean?'

He turned over the pages of his Diary. He could find no transactions of the kind at all. Then he reflected again. 'I can remember no transfers,' he murmured. 'Is this another trick of memory?'

Finally, he touched the bell upon his table. 'Checkley,' said Mr Dering, on the appearance of the ancient clerk, 'I have got a letter that I don't understand at all. I told you that my memory was going. Now you see. Here is a letter about transfers and sales of stock. What transfers? I don't understand one word of it. My memory is not only going—it is gone.'

'Memory going? Nonsense,' the old man shook his head. 'No—no; your memory is all right. Mine is as clear as a bell. So's yours.'

* Copyright 1892 in the United States of America by Harper & Brothers.

You eat hearty. So do I. You sleep well. So do I. We're both as hale and hearty as ever.'

'No—no. My memory is not what it was. I've told you so a dozen times. I lose myself sometimes. Yesterday, when the clock struck twelve, I thought it was only ten. I had lost two hours. And sometimes when I walk home I lose recollection of the walk afterwards.'

'Tut, tut; nobody of your age is such a young man as you. Why, you walk like five-and-twenty. And you eat hearty—you eat very hearty.' His words were encouraging, but he looked anxiously at his master. Truly, there was no apparent decay in Mr Dering. He sat as upright: he looked as keen: he spoke as clearly, as ever.

'Well—about this letter. My friend Ellis, of Ellis and Northcote, writes to me about something or other, and speaks of my effecting great transfers and sales of stock lately. What does he mean?'

'You haven't bought or sold any stock lately, that I know of.'

'Well, you would have known.—Have we had to make any investments for clients of late? There was the Dalton-Smith estate.'

'That was eleven months ago.'

'I suppose he must mean that—he can't mean anything else. Yes, that is it. Well—I've got a Partner now, so that it matters less than it would have done—had my memory played me tricks with no other responsible man in the place.'

'You didn't want a partner,' said Checkley jealously. 'You had ME.'

'He must mean that,' Mr Dering repeated. 'He can't mean anything else. However—has my Bank book been made up lately?'

'Here it is. Made up last Friday. Nothing been in or out since.'

Mr Dering had not looked at his book for three or four months. He was well served: his people took care of his Bank book. Now he opened it and began to run his finger up and down the pages.

'Checkley,' he said, 'what has happened to Newcastle Corporation Stock? The dividends were due some weeks ago. They are not paid yet. Is the town gone bankrupt? And—eh? Where is Wolverhampton? And—and'— He turned over the paper quickly. 'Checkley, there is something wrong with the book. Not a single dividend of anything entered for the last four months. There ought to have been about six hundred pounds in that time.'

'Queer mistake,' said Checkley. 'I'll take the book round to the Bank and have it corrected.'

'A very gross and careless mistake, I call it. Tell the manager I said so. Let it be set right at once, Checkley—at once—and while you wait. And bring it back to me.'

The Bank was in Chancery Lane, close to the office. The old clerk went off on his errand.

'A very careless mistake,' the lawyer repeated; 'any clerk of mine who committed such a mistake should be dismissed at once.' In fact, the certainty of full and speedy justice kept Mr Dering's clerks always at a high level of efficiency.

He returned to the letters, apparently with no further uneasiness.

After ten minutes, Checkley taking longer than he expected, Mr Dering became aware that his attention was wandering. 'Great transfers and many sales,' he repeated. 'After all, he must mean the investment of that Dalton-Smith money. Yet that was only a single transaction. What can he mean? He must have made a mistake. He must be thinking of another client. It's his memory, not mine, that is confused. That's it—his memory.'

The large open safe in the corner was filled with stacks of paper tied up and endorsed. These papers contained, among other things, the securities for the whole of Mr Dering's private fortune, which was now very considerable. Even the greatest City magnate would feel for Mr Dering the respect due to wealth if he knew the amount represented by the contents of that safe. There they were, the leases, agreements, mortgages, deeds, bonds, conveyances, shares, all the legal documents by which the wicked man is prevented from seizing and appropriating the rich man's savings. Formerly the rich man kept his money in a box with iron bands. He locked up the box and put it in a recess in the cellar contrived in the stone wall. If he was only a bourgeois, it was but a little box, and he put it in a secret place (but everybody knew the secret) at the head of his bed. If he were a peasant, he tied his money up in a clout and put it under the hearthstone. In any case, thieves broke in and stole those riches. Now, grown wiser, he has no box of treasures at all: he lends it all in various directions and to various associations and companies. Every rich man is a money-lender: he is either Shylock the Great or Shylock the Less, according to the amount he lends. Thieves can steal nothing but paper which is no use to them. As we grow wiser still, we shall have nothing at all in any house that can be of any use to any thief, because everything in the least valuable will have its papers, without the production of which nothing of value will be bought or sold. And all the gold and silver, whether forks or mugs, will be lodged in the Bank. Then everybody will become honest, and the eighth commandment will be forgotten.

Among Mr Dering's papers were share certificates, bonds, and scrip of various kinds, amounting in all to a great many thousands. Of this money a sum of nearly thirteen thousand pounds belonged to Elsie, but was still in her guardian's name. This, of course, was the fortune which had fallen so unexpectedly into the girl's hands. The rest, amounting to about twenty-five thousand pounds, was his own money. It represented of course only a part, only a small part of his very respectable fortune.

Mr Dering, whose memory, if it was decaying, was certainly clear on some points, looked across the room at the open safe, and began to think of the papers representing their investments. He remembered perfectly all the different Corporation Stock. All the water, gas, railway shares, the Indian Stock and the Colonial Stock: the Debenture companies and the Trading companies. He was foolish, he thought, to be disturbed by a mere mistake of the broker: his recent lapses of memory had made him nervous: there could be nothing wrong: but that clerk at the Bank ought to be dismissed for carelessness. There

could be nothing wrong: for the sake of assurance he would turn out the papers: but there could be nothing wrong.

He knew very well where they were: everything in his office had its place: they were all tied up together in a bulky parcel, bestowed upon a certain shelf or compartment of the safe. He pushed back his chair, got up, and walked over to the safe.

Strange! The papers were not in their place. Again he felt the former irritation at having forgotten something. It was always returning: every day he seemed to be forgetting something. But the certificates must be in the safe. He stood irresolutely looking at the piles of papers, trying to think how they could have been displaced. While he was thus wondering and gazing, Checkley came back, Bank-book in hand.

'There is something wrong,' he said. 'No dividends at all have been paid to your account for the last three months. There is no mistake at the Bank. I've seen the manager, and he's looked into it, and says there can't be any mistake about the entries.'

'No dividends? What is the meaning of it, Checkley? No dividends? Why, there's thirty-eight thousand pounds worth of stock. The certificates are kept here in the safe; only, for some reason or other, I can't find them at the moment. They must be in the safe somewhere. Just help me to find them, will you?'

He began to search among the papers, at first a little anxiously, then nervously, then feverishly.

'Where are they?' he cried, tossing over the bundles. 'They must be here. They must be here. Let us turn out the whole contents of the safe. We must find them. They have never been kept in any other place. Nobody has touched them or seen them except myself.'

The old clerk pulled out all the papers in the safe and laid them in a great pile on the table. When there was nothing left in the safe, they began systematically to go through the whole. When they had finished, they looked at each other blankly.

Everything was there except the certificates and scrip representing the investment of thirty-eight thousand pounds. These alone could not be found. They examined every packet: they opened every bundle of papers: they looked into every folded sheet of parchment or foolscap. The certificates were not in the safe. 'Well,' said the clerk at last, 'they're not here, you see.—Now then!'

In the midst of their perplexity happened a thing almost as surprising and quite as unexpected as the loss of the certificates. Among the papers was a small round parcel tied up with red tape. Checkley opened it. 'Bank-notes,' he said, and laid it aside. They were not at the moment looking for bank-notes, but for certificates. When he was satisfied that these were not in the safe, and had thrown, so to speak, the responsibility of finding out the cause of their absence upon his master, he took up once more this bundle. It was, as he had said, a bundle of bank-notes rolled up and tied round. He untied the knot and laid them flat, turning up the corners and counting. 'Curious,' he said; 'they're all ten-pound notes—all ten-pound notes:

there must be more than fifty of them. And the outside one is covered with dust. What are they?'

'How should I know?' said Mr Dering, irritably. 'Give them to me. Bank-notes? There are no Bank-notes in my safe.'

'Forgotten!' the clerk murmured. 'Clients' money, perhaps. But the client would have asked for it. Five or six hundred pounds. How can five hundred pounds be forgotten? Even a Rothschild would remember five hundred pounds. Forgotten!' He glanced suspiciously at his master, and shook his head, fumbling among the papers.

Mr Dering snatched the bundle from his clerk. Truly, they were bank-notes—ten-pound bank-notes; and they had been forgotten. The clerk was right. There is no Firm in the world where a bundle worth five hundred pounds could be forgotten and no inquiry made after it. Mr Dering stared blankly at them. 'Notes!' he cried—'notes! Ten-pound notes. What notes?—Checkley, how did these notes come here?'

'If you don't know,' the clerk replied, 'nobody knows. You've got the key of the safe.'

'Good Heavens!' If Mr Dering had been twenty years younger, he would have jumped. Men of seventy-five are not allowed to jump. The dignity of age does not allow of jumping. 'This is most wonderful! Checkley, this is most mysterious!'

'What is it?'

'These notes—the Devil is in the safe to-day, I do believe. First the certificates are lost; that is, they can't be found—and next these notes turn up.'

'What notes are they, then?'

'They are nothing else than the Bank-notes paid across the counter for that forged cheque of eight years ago. Oh! there is no doubt of it—none whatever. I remember the numbers—the consecutive numbers—seventy-two of them—seven hundred and twenty pounds. How did they get here? Who put them in? Checkley, I say, how did these notes get here?'

He held the notes in his hand and asked these questions in pure bewilderment, and not in the expectation of receiving any reply.

'The notes paid to that young gentleman when he forged the cheque,' said Checkley, 'must have been put back in the safe by him. There's no other way to account for it. He was afraid to present them. He heard you say they were stopped, and he put them back. I think I see him doing it. While he was flaring out, he done it—I'm sure I see him doing it.'

Mr Dering received this suggestion without remark. He laid down the notes and stared at his clerk. The two old men stared blankly at each other. Perhaps Checkley's countenance, of the two, expressed the greater astonishment.

'How did those notes get into the safe?' the lawyer repeated. 'This is even a more wonderful thing than the mislaying of the certificates. You took them out. Show me exactly where they were lying.'

'They were behind these books. See! the outside note is covered with dust.'

'They must have been lying there all these years. In my safe! The very notes paid across the counter to the forger's messenger! In my,

safe! What does this mean? I feel as if I was going mad. I say—What does all this mean, Checkley?

The clerk made answer slowly, repeating his former suggestion.

'Since young Arundel forged the cheque, young Arundel got the notes. Since young Arundel got the notes, young Arundel must have put them back. No one else could. When young Arundel put them back, he done it because he was afraid of your finding out. He put them back unseen by you that day when you charged him with the crime.'

'I did not charge him. I have charged no one.'

'I charged him, then, and you did not contradict. I'd charge him again if he was here.'

'Any man may charge anything upon any other man. There was no proof whatever, and none has ever come to light.'

'You're always for proofs that will convict a man. I only said that nobody else could do the thing. As for putting the notes back again in the safe, now I come to think of it—his face became cunning and malignant—'I do remember—yes—oh! yes—I clearly remember—I quite clearly remember—I see it as plain as if it was before me. He got sidling nearer and nearer the safe while we were talking: he got quite close—so—he chucked a bundle in when he thought I wasn't looking. I think—I almost think—I could swear to it.'

'Nonsense,' said the lawyer. 'Your memory is too clear. Tie up the notes, Checkley, and put them back. They may help, perhaps, some time, to find out the man. Meantime, let us go back to our search. Let us find these certificates.'

They had now examined every packet in the safe: they had looked at every paper: they had opened every book and searched through all the leaves. There was no doubt left: the certificates were not there.

Checkley began to tie up the bundles again. His master sat down trying to remember something—everything—that could account for their disappearance.

(To be continued.)

PLATELAYERS AND LOCOMOTIVE SUPERINTENDENTS.

THE humbler the position of a man, the less able and less willing is he to attract the attention of the public to his troubles and grievances; and consequently he receives many acts of injustice that would not be tolerated by his brethren who are better off from a worldly point of view. It is the same with classes of men as with individuals; and platelayers (called 'surfacemen' in Scotland) belong to the class of workers whose means of livelihood are small, and whose employment may be considered precarious.

It is well known that positions on railways are not always paid according to the amount of work done, and this remark applies equally to officials of every corporate body. If work were

paid for on this basis, and the importance of doing it well was also taken into consideration, platelayers would fare better than they do at present. Men holding responsible positions should of course be well paid, whatever the nature of their work may be, and no one expects that agricultural and other labourers, whose work is not of a responsible nature, nor skilful, should receive wages equal to men who are skilled in some trade, or who have any responsibility attached to their work. On railways, every man who has anything to do with their working or with the permanent-way, is more or less a responsible official, and his negligence may at any time cause serious disaster. Engine-drivers, guards, and signalmen are recognised as holding positions of responsibility, and their wages are consequently considerably above those paid to the average labourer.

A platelayer holds the most humble position on a railway; he is looked upon as simply a labourer, and yet is hardly recognised as belonging to the service. He receives no crumbs of comfort in the shape of 'tips,' nor has he a yearly or half-yearly bonus for doing his work well. He is not eligible to join every Benefit Society; and in the matter of insurance against accidents, he is only accepted at a high premium, on account of the dangerous nature of his employment. He has no uniform supplied to him, not even a greatcoat in winter, to battle against rain, snow, or fog, which he has to do at all times of the day and often at night; and his chances of promotion are—nil. He has the privilege of a free pass once a year, and his wages are a trifle above those paid to a common labourer. Such may be said to be his position in connection with the railway service, and it is not a cheerful one.

Now, for these few earthly benefits, what does a platelayer do? He starts work at six A.M. in summer and seven A.M. in winter, unless he is called up earlier on account of fog or accident. The whole of every line throughout the country is divided out in lengths, varying in distance according to circumstances. Each length is in the charge of a foreman and a few men, who are responsible for the rails and ballast being kept in a safe condition. The foreman is of course directly responsible to his chief, but he in his turn looks to his men as sharing that responsibility.

The length of line is examined twice a day. Rails may require raising, nuts and keys may require fastening, and sleepers may be short of ballast; all points and switches will have to be kept clean and oiled, and the line generally free from litter and obstructions. The fences on each side of the line must also be kept in perfect repair, and culverts and bridges in times of heavy rain must have special attention. When the length includes a tunnel, the same if not more attention has to be paid to their duties, and considerably more has to be paid to their own safety

Their hours of duty are generally about twelve a day.

Platelayers can be appropriately called 'the guardians of the permanent-way.' Under a scorching sun in summer and a nipping frost in winter, they can be seen daily at work; and they are thankful if they and their families have sufficient to eat, and can appear as respectable as other people in their position.

Such is briefly their ordinary work; but in foggy weather their work is cold and dangerous, for then they have to stand sentinel for hours together at the different signal-posts along the line, guarding the trains from unseen danger. Their day's work is then a very long one; and when the fog hangs heavy for days together over the country, they are sadly overtaxed. It is impossible to relieve them at such times; and it is only when necessity compels that a railway company will employ men not belonging to the service to perform this work.

It is in foggy weather that this class of men should be thought of, not only by the public, but also by their more fortunate comrades in the service; for it is then that we come across the familiar paragraphs in the newspapers, headed, 'Another platelayer killed in the fog.' And as though these men did not run sufficient risk for their daily earnings, travellers by our trains have added considerably to it by throwing bottles and other articles out of the carriage windows when the train is running at a high rate of speed, and many a platelayer carries the mark caused by such thoughtlessness on the part of the public.

That these men do their work well is sufficiently proved by the small number of accidents to trains that can be traced to their negligence; and it must be admitted that their work is responsible; yet, with all the drawbacks attending their occupation, they are not much given to grumbling, and they work on till age renders them of little use to their foremen; and though they may have been faithful servants for the best part of their life, yet a grateful railway company has little pity for such humble individuals, and informs them that their services can be dispensed with; and they go—whither we know not, and no one seems to care; but in all probability the workhouse does for them that last office which we shall all require whether we can pay for it or not.

It is not their fault that they are born to assist in protecting the lives of the travelling public at a weekly wage which is sadly inadequate to meet the sickness and breaking-up of the constitution which their work in inclement weather is sure to bring on; but wealthy corporations have seldom compassion on their poorest servants, and it is generally left to the public to give a helping hand to those who, having done their duty in some lowly walk of life, find when it is too late that their employers have only looked upon them as labour-machines from which a certain amount of work can be obtained; and when they are worn out they must be replaced. This class of men, considering their service to the public, have not their fair share in the benefits of those institutions which the public so largely subscribe to for the sick and needy of railway servants generally; and it would be well if some of the subscribers were to insist on the

claims of this deserving class of men being more largely provided for in the future.

LOCOMOTIVE SUPERINTENDENT.

This official has entire control over all the engines, and is responsible for them doing their work satisfactorily. Our large railways make their own engines, and in this case the designing and constructing are done under the supervision of the locomotive engineer. Taking the engines of three such companies as the Midland, London and North-Western, and Great Northern Railways, a casual observer can see that they differ from one another in several points; this arises from the engineers having different ideas as to the building of these powerful machines. There are a great number of patents connected with the machinery, and most of them have been brought out by these officials, and they use their own judgment as to what improvements are to be added. In the case of small railways, the engines are generally made by private firms in Manchester, Leeds, or Glasgow. The weight of an engine loaded varies according to its size; many of them are over seventy tons; and though they are so massive, they have parts about them of wonderful delicacy. Stephenson, the father of locomotive building, would look with wonder upon one of our modern engines, yet to him the present generation owe a great debt of gratitude.

The Locomotive Superintendent keeps a record of the performances of every engine, and they can tell almost any time the number of miles any particular one has travelled. It is a fact that an engine on the Great Western Railway ran 569,232 miles before it required renewal. The right to ride on an engine at any time is a very limited one, being allowed only to the General Manager, the Superintendent of the line, and the Locomotive Superintendent. In special cases only have other officers the power to do so. That this department of a railway is well managed, and that the official at the head of it is invariably a man of marked ability, is proved by the very few cases in which an accident can be traced to any fault of the engine. It must be borne in mind, however, that in case of a serious accident, each department will endeavour to clear itself, and will do its best to put the burden on other shoulders. The most common accident to an engine is having a tube burst; the rush of steam will often scald the driver and fireman; but such accidents as these are not chronicled. It is very probable that, taking all sorts of engines into consideration and the work they have to do, fewer accidents happen to a railway locomotive than to any other sort of engine.

The head of this department has to find power for all trains—passenger, goods, and excursion; and in the summer season his work is by no means light. Engines are too expensive to be lying idle all the winter, so that in summer the maximum amount of work is got out of a minimum number of engines, and the superintendent has so to arrange the journeys that all the work can be done. The drivers of course have to work hard in the busy season, but they are paid well, and do not often grumble on that score.

On our large railways, district superintendents are appointed. They have a certain number of engines in their charge, and supply the power for the local traffic. They are of course under the control of the superintendent.

Carriage and wagon building is also carried on in this department; and in places like Crewe and Doncaster many thousand hands are employed.*

THUNDERBOLT'S MATE.

v.

THUNDERBOLT'S mate heard plainly enough the yell of rage that announced the discovery of his escape. At that moment, his crutches had carried him considerably less than two hundred yards from the homestead; but he smiled complacently as he hobbled on; he felt tolerably secure. The night was as black as pitch; the clouds had banked up for rain; so that, when Brown looked over his shoulder, the outline of the station was invisible.

'Even if it was bright moonlight,' muttered Brown, as he neared the home-paddock gate, 'even if he could see me, he daren't give chase! He knows that if he left that veranda for half a minute, they'd be into the store and armed to the teeth before he could get back. But I know what he'll do now: he'll do like he done up in Queensland, when he stuck up Evelyn Downs single-handed. He'll make Sammy fetch a rope; then he'll set on one or two to bind all the rest; and then one of those two'll have to bind the other; and then Thunderbolt'll bind *him*. Then he'll ransack the place, and away with an hour's start before the first man frees himself. That's what he'd have done at Evelyn Downs, if those poor coves hadn't had too much pluck and too little sense. That's what he's doing now, for that Ayrton's too cool to lose his head or to let the others try anything on either, unless they were cocksure.'

In point of fact, Brown was right. At that very moment, Sammy, the Chinaman, was cutting down the clothes lines from the pine-trees behind his kitchen!

It is difficult, at best, to make respectable speed upon crutches—impossible, when the only leg that may touch the ground has been out of use for weeks, and when the whole frame is weakened and reduced by a prolonged period of inactivity. Brown got over the first mile at a good rate, considering everything; but he paid for it before he was half-way through the second. Quite suddenly, his brain reeled, the crutches slipped from under his arm-pits, he fell forward upon his hands. Instead of stunning him, the slight shock galvanised his swimming senses and cleared his brain; but he was wise enough to slip right down for a minute's rest, in which to gather strength and review the situation. He had not come more than a mile and a half, or a quarter of the way to the wool-shed—of this he was

certain. A quarter of the way, and he had already collapsed once! The prospect of his reaching the shed at all seemed by no means certain. Even if he did succeed in getting there, could he be in time to be of any use? He would, indeed, be able to despatch prompt assistance to the prisoners at the homestead—but only to find, no doubt, that they were prisoners no longer, and that the bushranger had got a long safe start. On the other hand, there were two possibilities to consider. There was the chance of the prisoners being so securely bound that it might take them hours to release themselves; and the thought of Mrs Lees and little Pen—above all, of little Pen—being lacerated for hours by the binding ropes was intolerable to Brown. Then there was the chance of Thunderbolt's capture, if a hne and cry were started by the shearers, most of whom had horses in the horse-paddock out at the shed; and the thought of *that* made Brown tremble with excitement. Without knowing which incentive was the stronger, he set his teeth, dragged himself from the ground, and once more swung forward on his crutches.

It was a terrible task that he had set himself—indeed, an impossible one; but Brown had not time to find this out. For he had not proceeded a hundred yards from the spot where he had fallen, when a galloping horseman overtook him. At first he thought it was Thunderbolt, crouched behind a big blue-bush at one side of the track, set his teeth, clubbed a crutch, and thought bitterly of his buried pistols. But when the horse came up, there was just light enough to see that it was a gray; and Thunderbolt's mount was black as ink. Besides, the rider was sitting all of a heap, and an unsteady heap too, which put it beyond doubt that it was not even Thunderbolt on one of the station horses. So then Brown started up as smartly as he was able and let out a loud shout; whereupon the rider—a harmless shearer, on his way home from a convivial evening in the township—nearly fell from his saddle, but reined up awkwardly, and showed his presence of mind by an eloquent but indistinct set of curses.

'Don't stop, man!' cried Brown. 'Ride on to the wool-shed for your life! The homestead's stuck up, and every soul's in Thunderbolt's hands!'

'Thunderbolt?'

'Thunderbolt!'

In an instant, the festive shearer became quite painfully sober, by comparison. He rode up close to Brown. 'Why—great Scot! you're the cove with the broken leg!'

'Get on, man; there's not a moment to lose!'

'But how the mischief did you get here? Crutches and all, so help me!'

'Oh, ride on, can't you?' cried Brown angrily.

'Think of the women and the child!'

The shearer sat for some seconds longer like a statue in the saddle; then, with a forcible imprecation—but a most complimentary one to 'the cove with the broken leg'—he dug spurs into the gray and thundered on. And Brown sank down again behind his blue-bush, and realised, now that it was off his shoulders, the complete impossibility of the task he had set himself—to hobble six miles on his crutches.

* The above is the concluding paper of the series on Railway Stations, Station-masters, Booking-clerks, &c., which have from time to time appeared in the *Journal*, and which are now, with some additional matter, published in a volume entitled, *Railways and Railway Men* (London and Edinburgh: W. & R. Chambers, Limited).

He lay upon the ground, utterly feeble, and feeling as though a forceps had been at work drawing every nerve and sinew out of his body. Consciousness almost forsook him; he fell into a state of partial stupor.

He was roused—it must have been an hour later—by a stampede of horses sweeping down the track at a gallop. It was the shearers, with William Lees at their head. When they had passed, Brown struggled up and propped himself once more upon his crutches, and began retracing his steps to the homestead. But his pace was considerably slower than it had been before. He thought he was never going to reach the home-paddock gate. At last he knew that he was near it, by hearing the double gates clatter back upon the posts and a horse's hoofs thunder through.

What followed occupied a few moments only. A black horse was reined up within a yard of Brown; and when Brown addressed the rider, taking him for one of the pursuers, a low, cruel laugh was the answer; and then—a flash, a report, a horse's gallop dying away in the distance; and Thunderbolt's mate left lying in his blood, shot by Thunderbolt!

On tragic nights, such as this one, people are slow to go to bed, even when the danger is over. At midnight, William Lees, his wife and child, and the trembling maid-servant, sat in silence in the sitting-room, awaiting the return of the hue and cry, which seemed certain at last to capture the notorious Thunderbolt, but which in point of fact did no such thing. Lees at the moment was an embittered man: he, and he alone, was out of the chase: duty had tied him to the domestic apron strings, and the action of his young men—who had joined the pursuers without so much as asking leave—had tightened the knots.

All at once, but so silently that her parents hardly noticed it, little Pen stole out into the veranda. She fancied she had heard a faint cry: in the veranda, fancy became certainty, for the cry was repeated: 'Miss Pen!'

The voice was sadly feeble, but it was Brown's voice. Pen knew it instantly, and went swiftly but softly to the end of the veranda. The faint summons came yet again: 'Miss Pen!'

The child rushed out, groped for and found the picket-fence, followed it down to the wicket, went through, and almost fell over a man's prostrate form.

'Miss Pen! Is it really you?'

'Is that really *you*, Brown?' It was very, very dark, and fine rain was falling.

'Yes, miss, it's me—come back,' said Brown, very faintly. 'I'm glad you heard me, and came—in time. Water! My throat is on fire.'

She turned like lightning. He called her back.

'Miss Pen!' His voice terrified her; it was fainter than ever; and he was gasping. 'You didn't believe—Miss Pen—I was siding with *him*—to-night—did you?'

'No, Brown; really and truly, I didn't believe that!'

She gave him her little hand, and he pressed it to his cold, damp lips. 'Water!' he gasped again.

Pen ran away, a great lump in her throat, a vague terror in her heart. As she neared the veranda she thought she heard a long-drawn choking sigh. She burst into the room, and told her parents Brown was outside, just beyond the fence, lying down exhausted and begging for water. But before she had told them all, the child stopped, and uttered a shrill scream: the light of the lamp had revealed blood upon her hand! William Lees said nothing, but seized the water-bottle and rushed out. He was too late. Thunderbolt's mate was dead.

The reader may like to know that Thunderbolt himself never left that district alive; the police sergeant from the township near Bilbil shot him dead within forty-eight hours from that midnight. But it is needless to add that there was neither comfort nor consolation in this for little Penelope Lees.

A STRANGE SETTLEMENT IN PENNSYLVANIA.

It was on a beautiful summer morning in 1885 that I first visited Economy, a little German settlement on the right bank of the river Ohio; but not even the brightness of an August day could dispel the gloom which the strange quietness of the place cast over my spirits. In the midst of an earnest, active civilisation, and yet not of it, this unique community seemed to belong to some past age, and was a very Rip Van Winkle among the stirring, progressive villages of Western Pennsylvania. Unique I believe it to be; quaint it certainly is; and its story, from the day it was founded up to the present time, cannot but be fraught with intense interest to any one whose heart beats in sympathy with humanity in its struggles after an ideal human existence, though these struggles lead into errors which to many might seem unpardonable.

In the year 1803 a German named Rapp went out to America, accompanied by numbers of his fellow-countrymen whom he had won over to his own peculiar way of thinking, and he founded in Pennsylvania a little colony which he called Harmony. After twelve years, abandoning this settlement, he founded in Indiana a second settlement—New Harmony; but this he sold in 1824 to Robert Owen, and returned to Pennsylvania, where he founded the village of Economy, seventeen miles from Pittsburgh. Here those of his followers who still survive live a lonely isolated life, a life from which the average human heart, hungry for the sympathy and love which spring from the natural relationships of life, would shrink almost as from a living death.

Mr Rapp's mind was absorbed in the thought of the speedy coming of Christ to earth again, and all his energies were bent toward the one object of amassing great wealth, not for his own benefit, but that it might be placed at the disposal of Christ at His second coming. The idea that our Lord could ever need our silver and

gold, should He revisit the earth in bodily form, certainly seems to us a strange one; but we cannot for one moment doubt the sincerity of the founder of the Economites in trying to accomplish his self-imposed task.

Judging rightly that the strictest economy would be necessary to the fulfilling of his purpose, Mr Rapp drew up a code of rules which he thought well suited to the practice of economy, and his followers were required to abide by them. All things were to be in common: the money earned by their labour was to form one common fund; and one shop was opened from which all the bodily needs of these simple people could be supplied without money or price from them. The principal vow exacted from those joining this strange community was that of celibacy, and those members who were married before joining the Economites were required to live separately. This vow, however, was binding upon the members only while they remained in the society.

In cases of defection a forgiving spirit was manifested by the community, as is shown by the following incident. Shortly after the society was founded two of the members—a man and a woman—left, and were married. Many years afterwards the man died. His wife returned to Economy with her daughter, also a widow, and two small grandchildren; and she begged to be received with her family into the fold she had once despised. She was kindly re-admitted into the fellowship of the Economites, and she now lives among them as though she had never been a wandering sheep. Her grandchildren have a decided talent for music, and are provided with music masters at the expense of the community.

At the time the colony was founded, land in Pennsylvania was much cheaper than it is now, and the Economites acquired thousands of acres extending along the right bank of the Ohio. The greater portion of their land they set apart for ordinary agricultural purposes; the remainder they planted in vineyards, the wine of which is justly celebrated for its richness and delicate flavour.

Their houses are in the orthodox 'Deutsche' style, having all the doors and windows at the back, and presenting inhospitable-looking fronts to the passers-by. Behind each house is a little garden plot filled with flowers, brought from the Fatherland, and therefore dear to the German heart; and the front of each dwelling is ornamented by a hardy vine, which greatly relieves the monotony of red brick; though evidently the thought of utility alone led to the planting of the vines.

A church was built, in which, Sunday after Sunday, Mr Rapp proclaimed to his followers the Word of life. His daughter played the harmonium; while the men and women of the society, clad respectively in dark blue coats and dresses, and sitting on opposite sides of the building, sang praises to God.

For more than a score of years the Economites lived on under the leadership of their founder, following the same routine in their daily life, and at peace with God and man. When Mr Rapp died, Mr Henrici, his assistant in managing the affairs of the settlement, succeeded him in its leadership. As time passed by, many members

of the community were gathered to their fathers, while but few came to fill their vacant places. Six years ago, when I made my first visit to Economy, only forty old men and women, with backs bent by hard labour and heads silvered by age, were left in the colony. The manual labour necessary for farming their vast acres and managing their large dairies could not then be performed by the Economites themselves, as it once had been, and labourers, mostly Germans, from the outside world, had for some years past been employed by them.

By this time, as the result of their years of toil and self-denial, the Economites had acquired wealth surpassing their fondest hopes. They had millions of dollars invested in railway and bank shares; while their broad acres, each year increasing in value, had come to be worth many times the sum paid for them; and their immense wine-cellars were filled with sparkling liquors which might have tempted the palate of Bacchus himself.

Just before this, the only young member of the community, a man about thirty years of age, who was being trained to succeed Mr Henrici in his position of trust when the latter should die, committed suicide by taking prussic acid. He left a letter stating that the burden of the responsibility which he knew might at any time be thrust upon him, added to the unrest caused by the unnatural life he was leading, rendered his existence so miserable that he felt he must end it. I held in my hand the bottle which had contained the deadly drug; I saw the chair in which the poor victim sat when he took the fatal draught; and old Mr Henrici's eyes filled with tears as he spoke to my companions and myself of the young man and his tragic end.

Since then about thirty new members have joined the society of which Mr Henrici still lives to be head. When I last visited Economy, some few months ago, I saw and conversed with the young man who fills the place of the one who took his own life, and who, in the natural course of events, will soon have control of an estate which princes might well covet.

It is said that Miss Rapp in her youthful days had a lover among her father's followers, and that the two wished to marry and leave the community. However, a stern though well-meaning father interposed his authority, and the maiden was left to pine for three months behind a bolted door, while the disconsolate and faithful lover sought to cheer her loneliness by playing and singing under her window while her father slept.

When I saw Miss Rapp she had reached an age beyond the years allotted to humankind. Any traces of trouble and sorrow which once might have marred the serenity of her countenance had passed away, and her face spoke only of the deep abiding peace which comes from perfect heart-rest. The old German lady, with her dark blue silk gown, and a black silk square folded neatly over her breast, was a charming hostess, and she made sweet music for us on an old-fashioned piano which she had brought from her native land.

Before many years this quaint community will probably be a thing of the past; for any society founded upon principles so unnatural cannot be

permanent. But upon those who knew the Economites best, the memory of their pure unselfish lives will not be without its lasting influence for good.

NUNC DIMITTIS:

A PASTORAL.

Twilight and evening bell,
And after that the dark,
And may there be no sadness of farewell
When I embark.

THE vicar of Lewcombe passed through the gate of the churchyard, which swung squeakily round on its centre under the high-pitched roof of brown thatch, and entered the church by the door in the tower. He had paused on his way, as he always did, to speak with the wife of the sexton, whose cottage looked across at the rising ground on which the gravestones stood, with the church in their midst. Father and son, in a direct line for a hundred and forty years, the sextons of Lewcombe had made that cottage their home, and the sight of it was dear to the vicar's eyes. The old gray walls were rich in lichen, stonecrop, and moss; and the mullioned windows with their square heads were eloquent of the Tudor age. Up to the overhanging thatched eaves, myrtles and white jessamine climbed on either side of the porch; and the little slip of garden in front of the house was bright with hollyhocks and sunflowers. A large wicker bird-cage hung above the door, but for the present at anyrate it was empty. Five or six plump fowls waddled round the gateposts and out into the road; and in a corner of the garden the tame magpie was taking its afternoon walk in dignified solitude. As the vicar approached, a yellow-hammer, or 'gladdy,' as the sexton's children called it, spread its gay wings and fluttered aloft; and though it was past the middle of September, swallows and martins were still wheeling swiftly through the calm mild air.

The sexton's wife, who was always busied about something, had thrown open the hatch, or half-door, of the cottage, and was diligently bathing her youngest born, a little three-year-old girl, at the open doorway—'washing my lady on the dreskel,' as she explained to the vicar, 'to save the flossing'—or, in other words, to avoid splashing the floor of her one sitting-room. The vicar noticed that the child coughed once or twice while he stood by, and he mildly asked whether the exposure was prudent. 'Er's a bit hoozy,' the good woman admitted in her matter-of-fact way, plying the soap vigorously; 'and when er's made all vitty and clean, er shall zog a bit in the old arm-chair.' The great hooded seat in the chimney corner, which it was plain had been made out of the hinder part of an old-fashioned closed carriage, looked cosy and inviting, and the fire glowed cheerily on the ample hearth. So the vicar just smiled and nodded in his kindly way and went on, leaving the child to its mother's care.

Every week-day afternoon for ten years, with hardly any exceptions, he had shut himself up for two or three hours in the church. During all that time he had been working at a task which he had set himself for love of the place;

and apart from the associations gathering round thirty-five years of patient ministration, the church fully deserved all the affection and veneration which the old man bestowed upon it. Externally its pride was the unusually lofty Early English tower, up the sides of which, at this season of the year, the bright red creeper blazed in the warm sunlight, reaching up in flame-like peaks to the level of the long-necked gargoyles, whose facial expression had grown blank and meaningless from extreme old age; while, within, it gloried in a handsome rood-screen, almost perfect, and richly ornamented with a tracery of grapes, vine-foliage, and acorns, and an under-border of quatrefoils, in the elaborate and conscientious style of the thirteenth century. A few of the pew-heads had been decorated in a similar manner at the same time; but most of them had been left without ornament. Men to work upon them, or money to pay them with, had been wanting, and, unadorned, the simple curves of the old oak had acquired that plum-like bloom and softness which are so unmistakable to the sight and touch, and form so conclusive a proof of genuine antiquity. It was this defect which the vicar had set himself to remedy. He had a cunning hand, and a genuine love of the wood-carver's art; and ten years ago, as nearly as possible, his second son and only remaining child had gone away out into the world, and left him to end his days alone in the remote west-country village. So, patiently and lovingly, as a solace for his loneliness, he began to work on the old pew-heads, faithfully following in every minute turn of leaf and twig the models with which a bygone age had furnished him.

But to-day, no matter how slowly and carefully he wrought, or how long he paused to caress the smooth, shining curves of the dark wood, his task would be at an end. An hour's work at the most lay before him, and then the last pew-head would be complete in every detail. It was with a keen pang of regret that he thought of this, as he pushed open the heavy door in the tower and bared his white head. The years during which he had toiled so regularly and so zealously in that subdued light seemed to have passed by like some long and quiet dream, of which we find upon awaking that, while a vague impression of peacefulness is still left with us, the succession of shadowy incidents has wholly escaped our memory. There had of course been the usual round of duties—baptisms, marriages, and funerals, visiting the sick, organising coal clubs, superintending in the Sunday school, presiding at parish entertainments, and so forth, and these things had never been neglected; but the work in the old church had been, ever since it was begun, the centre round which all the vicar's other occupations revolved, the thought always uppermost in his mind, the pride and delight of each day that dawned. And now it was coming to a close! There was much that might still be done, he knew, if he dared to do it; but this duty—the simple duty of completing what others had left undone—was at length performed, and he shrank from attempting more than that. Good workman though he was, he had not the courage to do more than copy as accurately as he could what was already there. And if he limited

himself to that, his occupation would be gone that day.

He sat down and looked upon his own handiwork with eyes before which there swam a mist of swift memories. His thoughts, of their own motion and by no wish of his, went back at once to the happy past—the days of his courtship, his marriage, the infancy and boyhood of the two sons who had been born to him. The keen sweet scent of the cold stone and mellow oak, familiar though it was, called up before him to-day picture after picture, rising out of the uneventful years of peaceful toil and obscure faithfulness. At one moment he was looking down once more with a strange thrill of admiration on the face of the girl who was one day to become his wife, as she sat beneath the pulpit with wide blue eyes upturned, listening to the new vicar's sermon: at another, he held her in his arms for the first time and kissed her lips. Now, again, with a heart full of gratitude and joy, before the altar rails of this very church, he was making his marriage vows over again, as he had done more than thirty years ago. She was so young and slight at that time, he remembered—so girlish, indeed, that at first he had feared that, even if she was not too beautiful, she was at all events too young for a middle-aged country clergyman like him; and yet, in spite of her youth and beauty, she had been dead now more than sixteen years—sixteen long and lonely years.

A thousand trifles, too, of which it seemed that he had never thought before, flooded his memory, and kept a smile flickering about the corners of his mouth. Speeches, looks, tones, gestures, groups formed by chance in the rooms of the vicarage or in the garden, recurred to him vividly and persistently, though he was puzzled to know why such things should have lived in his memory at all. Now and again, a sigh escaped him: there had been difficulties and misunderstandings and cares even in his peaceful life, as in the lives of all men; but for the most part the past was pleasant to look back upon, and the present, in spite of the loneliness of his old age, was not all unkindly. His sons were prospering, and wrote cheerfully and hopefully of the future; and if they were kept apart from him, that, too, he knew, was all for their own good. There was nothing but thankfulness in his heart as he bowed his head for an instant with the movement of one who says, 'I am content.' And then he lifted the skilled right hand, which looked so incongruously young and strong in comparison with the worn face, and bent for the last time over the work which had kept him happy and busy for so many years. Even if it had not been work that he loved, there is enough pathos bound up with the last time of doing anything to have saddened a heart so gentle and so tender as his.

At the coming on of twilight the sexton's wife came to the door of her cottage and looked up towards the church, wondering why the vicar had not left it yet. The child, clad in its little nightdress and snugly wrapped up in a blanket, was fast asleep in the big hooded chair, and the mother stepped warily across the room from the other side of the fireplace and peered out. There was no one moving in the churchyard, and her

eyes passed through the misty gloaming in vain from one opening between the gravestones to another. The clock in the tower was just chiming the hour of seven, and between the quaint wooden figures of Moses and Aaron, perched upon the screen which separated the belfry from the rest of the church, only the faintest afterglow of the sunken sun was stealing in through the western window. Low down in the sky there still lingered a wide strip of the deepest crimson, which rose upwards through every shade of orange and rose-colour to those exquisite opal tints which weld the splendours of sunset to the pale green of an evening sky in autumn; but it was far too dark to work, and had it been as bright as noonday, the work which the vicar had to do was finished. Yet he sat there still, with a smile on his lips, and his hand still held the tool which under his guidance had made the last of the old pew-heads like unto its fellows. In the church which he had loved so long and adorned so reverently, at the stillest hour of that still September day, the vicar had learned all that is to be learned of the love of God for those who have loved and trusted Him.

THE MONTH:

SCIENCE AND ARTS.

THE increasing number of collisions between ships at sea, which generally occur in the night-time and very often in clear weather, would indicate that under present conditions the captain of a ship has no means of judging the course which an approaching vessel is steering. As a matter of fact, he cannot tell which side the coming vessel intends to take until either its green or red light is shut out. The Patent Crescent Course Indicator has been invented by Mr J. F. Wiles to obviate this difficulty; and so far as we can see, it fulfils its purpose admirably. It consists of one lamp, which may be an oil lamp or an electric one, put in a lantern of peculiar construction, which is hung on deck in the forward part of the ship. The lantern in shape resembles a round tub with sloping sides set on edge, its bottom, which is quite opaque, pointing towards the bow of the ship. The sides only of the 'tub' are translucent, so that any one being in the exact line of the ship on which such a lantern is carried would see a luminous ring. If, however, the ship alters her course only by a little, one side of the ring is shut off, and the luminous patch takes the form of a crescent. It is obvious that the course steered by the vessel must be in the direction of the horns of that crescent. The plan is exquisitely simple, for the lantern is fixed, and has no mechanical movements. Its indications are perfectly clear, and are governed only by the direction in which the ship is moving. Particulars can be obtained of Mr Wiles, at Lloyds, London, E.C.

A flexible Metallic Tubing has lately been introduced, and will doubtless find employment in many trades. These tubes are made in various sizes, and will bear great internal pressure. They are produced from strips of metal which by a special machine are corrugated longitudinally with two grooves, a large and a small one, side by side. When such a strip is coiled round

a mandrel, the small corrugation interlocks with the larger one and makes what is known as a 'piston joint.' A tubing of somewhat similar character was made formerly with a strip of india-rubber inserted in the joint, to make it water-tight. In the present case this is dispensed with, and water and other liquids can be conveyed through the tubing without leakage, although they may have a pressure of some hundred pounds on the square inch. The offices of the company formed to work this industry are at 48 Parker Street, London.

Among the many proposed remedies to improve the atmosphere of London and other large cities is the use of anthracite, or steam-coal, as it is commonly called. A deputation recently waited upon the Lord Mayor to urge this innovation; and although there is a suspicion that such a proposal may have commercial enterprise at the back of it, there is no doubt that the use of such coal would be beneficial to the public at large. It would seem that there is a certain amount of prejudice against the domestic use of anthracite on account of the supposed difficulty of lighting it; but this is a difficulty which has not prevented its adoption in Paris, Berlin, and other continental cities. The deputation said nothing about price; but it is obvious that if they can bring coal to Londoners at a cheaper rate than the smoky variety commonly used, they will not have to wait long for customers. It remains to be proved, however, that the common type of open grate is suitable for burning anthracite.

In speaking of Sisal Grass, or 'Bahama Fibre,' as it is now called, Sir Ambrose Shed, the governor of the twenty islands which are grouped under the title of the Bahamas, is reported to have said that this valuable fibre was until recently destroyed as a noxious weed. Now, no fewer than one hundred thousand acres of it are grown on crown lands. This quantity will afford a yield of fifty thousand tons annually; and as it is marketable at from twenty to twenty-four pounds a ton, it will be seen that the 'noxious weed' has been turned to good account. The Bahama fibre is valuable for ropemaking, and more especially for ship cables owing to its power of resisting the action of sea-water (see *Chambers's Journal* for Dec. 21, 1889). It may be mentioned here that a cable is about to be laid to connect the Bahamas with the United States, and it is expected that when this is complete, many ships will call at the islands for orders. It is also supposed that when the Bahamas are thus brought within speaking distance of the American continent, tourists will flock there, to enjoy a climate which cannot be excelled, where winter is a meaningless word, and where frost is unknown.

A correspondent of the *Times* makes a valuable suggestion. He proposes that at railway stations there should be a window for 'exposed telegrams,' so that a traveller who is from any cause delayed on his journey may by such means communicate with friends who are waiting for him at the station. If such a traveller missed his train at a junction, a thing which too frequently happens, he would be able to hand a telegram to the authorities which would be displayed in the manner indicated at the station where he was ultimately expected. The plan would be rendered still more

serviceable to the public if the companies would give notice by its aid that such and such trains were delayed, and would not arrive until so many minutes after their appointed time. This system is already in use at a few stations on our trunk lines, but it should be universal.

Sunshine is recorded at the Meteorological Office by means of the Stokes-Campbell instrument, the essential feature of which is a spherical lens which acts as a burning-glass. As the sun accomplishes its apparent journey from east to west, it burns its autograph into a strip of card placed beneath the lens, but can only do so when it is unobscured. As the card is divided into hours, it is easy to calculate the amount of actual sunshine with which each day is favoured. A Report has recently been issued giving the results achieved by this instrument for the past ten years. From this we learn that our southern coasts are the most sunny ones, if we except the Channel Islands, as represented by Jersey, where alone one-half the possible amount of radiance was registered for May and August. The east coast of Britain is also decidedly sunny. In the summer and early autumn, Ireland shares with the west coast of Scotland the reputation of persistently clouded skies; but later on, towards November, the observatory in the Phoenix Park, Dublin, records the greatest average amount of sunshine for that month—namely, twenty-eight per cent. In the metropolis, as might be expected, the record is bad, the sun failing to leave any trace on the card for more than one entire month.

According to a recent Report made to the Foreign Office by the British consul at Buenos Ayres, a new industry has been founded in the Argentine Republic by the utilisation of the vast shallow lakes of salt, or *salinas*, which are situated there. These beds are mostly too far from the seaboard to be profitably worked; but an exception is found in the salinas of the Rio Negro Valley, which are only about twenty-two miles from the harbour of San Blas. These are estimated to contain twenty thousand acres of salt-bearing ground, which owes its supply of salt to miles of rock-salt at the foot of the Andes, two hundred and fifty leagues distant. Everything here conspires to the rapid production of the mineral, for the rainfall is small, while the sun and strong winds combine to evaporate the water, leaving beds of solid salt from two to four inches in thickness. A company has been formed, under concession from the Government, to develop this new industry, and they are already bringing into the market large supplies of salt for different trades as well as for household use. Hitherto, the import of English salt has amounted to about two thousand tons annually, bearing an *ad valorem* duty of twenty-five per cent.

The Platinotype Company of London have recently brought out a Lamp, the invention of Mr E. J. Humphery, which promises to be of great value to photographers, and may possibly find employment for signalling, and other purposes where brilliant illumination for short periods is required. The lamp consists of a hollow metallic vessel, which is charged with a spoonful of magnesium dust. Ordinary household gas is carried into the lamp by an attached rubber tube, while another tube feeds it with

oxygen. The tubes within the apparatus are so arranged that the hydrogen burns between two walls of oxygen, and the force of the former gas is sufficient to carry into the compound flame the metallic dust. The result is a light which is dazzling in its intensity, and which is so chemically active that it can not only be used for photographic portraiture but can be used advantageously for printing purposes. By a slight modification, a large quantity of the magnesium dust can be forced suddenly into the flame, so as to afford a 'flash' light suitable for instantaneous work at night. The lamp is portable, and can be used wherever gas is at hand.

There are so many novel applications of electricity nowadays that one is apt to think that the wonderful accounts sometimes published concerning them must be tempered with exaggeration. At first sight, for instance, it would seem impossible that the growth of seeds should be accelerated by planting them between zinc and copper plates buried in the ground. Such an effect, however, has been produced by Dr James Leicester of Bristol, who gives an account in the *Chemical News* of the method which he adopts in producing this extraordinary result, a method so simple and inexpensive that any amateur gardener can follow his example. A box about three feet long is filled with soil, and at one end of it is buried a copper plate about one foot square; and facing it, at the other end of the box, is a zinc plate of the same dimensions. The two plates are connected above the surface of the soil by a copper wire. Seeds grown between these plates spring up far more quickly than seeds planted under normal conditions. In the case of hemp-seed, it was fully an inch above the surface before other hemp seed planted at the same time in an ordinary vessel made any appearance at all.

In the grounds of the 'World's Fair' at Chicago there has been running for some time experimentally a tram car which is fireless, steamless, and noiseless, which its promoters hope will supersede the use of horses, cables, and electricity for street tramway purposes. It is fitted with a motor which owes its power to the expansion of ammonia from the liquid to the gaseous state. The pressure obtainable is nearly one hundred and fifty pounds on the square inch, and the ammonia, after having done its work, can be again condensed to its original state at the generating works, and can be used over again. With one charge of ammonia the car will run eighteen miles; and the operation of removing the spent gas, which is absorbed in a water tank, and recharging occupies only two minutes. The working expenses are wonderfully low, and it is believed that the system has a wide future before it.

It will be remembered that a year or two back the great railway companies whose lines connect London with Edinburgh competed with one another as to which should cover the distance in the shortest time, with the result that the Great Northern beat the record of the world's railroad speeds by running 393 miles in 414 minutes. This fine exploit has been beaten by the New York Central and Hudson River Railway, which has accomplished the unparalleled feat of running a heavy train from New York to East Buffalo, a distance of 436½ miles, in 439½

minutes, including all stoppages. This speed, it is said, will be quite eclipsed by an electric railway which is being constructed between Chicago and St Louis, upon which travellers will be hurried along at the rate of one hundred miles per hour. An important factor in this calculation is the wedge-form given to the foremost portion of the electric motor car, which will enable it to cleave the air, and thus reduce atmospheric resistance.

There seems to be little doubt that the influenza scourge is due, like so many other epidemics, to a bacillus; and two French scientists assert that they have discovered the organism, and have succeeded in cultivating it in bouillon, after Pasteur's method. The microscopic germ is fashioned like the figure 8, and it has been shown that rabbits and monkeys inoculated with the preparation in which it has been artificially cultivated speedily exhibit all the symptoms of influenza. These experiments have been confirmed by others; and it now remains to be seen whether some system of inoculation may not be devised which may be as efficacious in the case of influenza as Jenner's method has proved to be in the case of smallpox.

Now that our 'wooden walls' are not made of wood, but are represented by vast ships which are principally constructed of metal, it would naturally have been thought that teak, the wood upon which shipbuilders of old most depended, would have become as it were a drug in the market. But this is by no means the case. Architects and builders have discovered its wonderful durability, and the question has arisen whether the supply will not presently fall short of the demand. Central and South India, Burma, and Siam are the principal countries which send us teak; but in many cases the old fable of killing the goose for the sake of its golden eggs is exemplified by the native practice of cutting down all the old trees, without providing for future needs by the planting of fresh ones.

A new process of separating oxygen from the atmosphere for industrial purposes has recently been elaborated, and may be seen in action at the works of Parkinson's Condensed Gas Company, Stretford, Manchester. Briefly described, the process consists in passing air under pressure through specially prepared permanganate of potash heated in retorts. This chemical under such conditions will absorb the oxygen, while it rejects the other constituent of the atmosphere—nitrogen. The oxygen so absorbed is afterwards drawn off by vacuum pumps, and is stored in a gasholder, to be afterwards compressed in steel cylinders and distributed for use. The process is continuous, and so cheap that it is estimated that the actual cost of producing the gas is not more than eighteenpence per thousand feet.

Another process, for obtaining an illuminating gas of high power, also hails from Manchester. This is put forward by the Hydro-oxy Gas Company, who have forwarded us particulars of their operations. In the first place, they make gas from any cheap petroleum, creosote, or other heavy oil, afterwards purifying it, and increasing its illuminating power at the same time by the addition of a certain proportion of pure oxygen. The mixture so made may also be used for enrich-

ing ordinary coal-gas. The compound, it should be stated, is not an explosive one, for the proportion of oxygen added is far too small to reach the danger-point.

La Nature recently published a map showing the system of military pigeon-posts which has been established in continental kingdoms, a method of communication which in our own country has been quite neglected. Some interesting particulars are also given with regard to the birds and the method of training them, in which it is pointed out that the pigeon is one of the very few species which are capable of being domesticated. By this is not meant merely tamed, but rendered domestic in the sense of attaching itself to any particular domicile. The birds are guided in their return home simply by sight, and not by any particular instinct. For this reason they must be made familiar with the contour of the country surrounding their home, by many short essays, before they are trusted on a long journey. Many are lost during this apprenticeship, the fittest surviving. So many pigeon-flying societies are existent in Britain at the present time, and so much attention is devoted to training them, that a number could be soon available for military service if the authorities required them. Many cases suggest themselves where, in the case of the electric wires being cut by an enemy, this means of communication would be priceless in value. It certainly was found so in the case of the siege of Paris, where a regular post was established by means of these useful carriers.

In certain parts of the country, a plague of mice has recently been experienced, to the great loss of farmers, for by mice is understood not the little rodent which finds its way to our larders, but the field vole (*Arvicola agrestis*). At a recent meeting of the Edinburgh Field Naturalists' and Microscopical Society, Mr T. Speedy gave some interesting particulars concerning the way in which certain districts have been overrun with these little creatures, and expressed his doubts with regard to the reason commonly advanced to account for their numbers. It has been often affirmed that such a visitation is due to the wanton extermination of hawks and owls, whose natural prey are these voles. But Mr Speedy plainly showed that in parts of Selkirkshire where the Duke of Buccleuch had long prohibited the destruction of the birds, voles existed in great numbers. He had also found that in parts of Norway where all predaceous birds breed without restraint, hordes of lemmings, which are allied to the voles, periodically make their appearance.

There have been many discussions as to the heights attained by breaking waves, and an interesting light is thrown upon the matter by the terrible experience to which the keepers on Tillamook lighthouse were subjected during a storm which occurred last December, as described in a recent number of the *San Francisco Chronicle*. The waves broke over the lighthouse and shook it to its foundations, so much so, that the men in charge would far rather have been on ship-board. Streams of water poured through the ventilators at the top of the structure, which are one hundred and fifty-seven feet above sea-level. Landing platform, boats, and gear were all torn

away and destroyed. Professor Holden asserts that it is known to him personally that this lighthouse is sometimes buried in water and spray, and that the glass in the lantern has been frequently broken by impact of the waves.

SOME INSURANCE FRAUDS.

THE large insurance companies seldom dispute claims unless they have grounds of suspicion amounting to moral certainty. Even in this event they sometimes pay over the insurance money rather than go to law, because, however good their case may be, a contest excites suspicion against them in the minds of the public, and has often an appreciable effect on their business. Now and again, however, it is absolutely necessary if they are, and know they are, dealing with a clever rogue, to trot the gentleman through the law-courts to save themselves and not be swindled outright.

There is one company in London whose boast it is that it has never been driven to this extreme but once. The facts were these: A man named Innes had effected a policy for one thousand pounds on the life of his step-daughter. She died under rather tragical circumstances; and Innes produced a will, which appeared on the face of it to have been duly executed by her, declaring him executor and legatee. Its validity was contested; and Innes produced two attesting witnesses, who swore boldly to all the required formalities. They would have won the case for the legatee had the latter not insisted on calling a third witness. This man's courage failed him, or a feeling of compunction overmastered him. Wan and ghastly he entered the witness-box, where his first words were: 'My lord, my name is Borthwick; I am brother to the witness of the same name who has been examined. The will was not made on the Bridge Gate at Glasgow; it was forged by a schoolmaster in the Maze in the borough.'

For his share in this attempted swindle, Innes was hanged; and his two confederates were sentenced each to five years' imprisonment.

The first notorious insurance fraud occurred a century and a half ago. A man and woman of the semi-genteel class, the woman about twenty, and the man old enough to be her father, were the actors. Scene the first was the seeming death-bed of the lady, round which the neighbours were hastily summoned in the middle of the night by her male companion, who called her his daughter, and said she had been suddenly seized with pains in the heart. Before the doctor could arrive, she was to all appearance a corpse; and after feeling her pulse, he solemnly pronounced that all was over. Her remains were enclosed in a coffin and buried. The man claimed the amount insured on her life, and disappeared from the vicinity of St Giles'.

Not long afterwards, a couple, strangely like the two actors in the foregoing scene, came to reside in Queen Square, then a rather fashionable

quarter. They kept a pleasant house, entertained their neighbours, and made themselves thoroughly popular. This was kept up for some months, and then there was a repetition of the catastrophe—a heart complaint, a short sharp death-struggle, a desponding doctor, and a funeral. For a second time the insurance companies, individual and associated, were bled to the tune of several thousands.

A year or two later the pair reappeared in Liverpool in the shape of a merchant and his niece who kept house for him. On this new arena the man came out in the grave, decorous, and eminently respectable line, subscribing to charities, going regularly to church, and yielding to mundane vanities and indulgences only so far as to give good dinners. After a time he adopted the tone of one who had sustained unexpected reverses, which compelled him to borrow money on the security of property depending on his niece's life. He effected policies accordingly; and the old game was played over again for the third time with similar success.

After a decent delay, he left Liverpool 'because of the saddening reminiscences,' he said, and was not suspected for some time. He was probably meditating a fourth coup, when the three adventures and the circumstances attending them became known to the victims, and compelled him to lie low again. He never reappeared; but as he had made over twenty thousand pounds by the game, he could afford to live in retirement. The most mysterious part of the affair is the 'niece.' Had she the power of simulating death? Or had she discovered the secret of the draught compounded by Friar Laurence for Juliet? But it is possible that the medical men and the undertakers were bribed.

Four gentlemanly-looking individuals hired a boat one wild autumn evening at Blackfriars Bridge, and rowed up the river. After going some distance, the boat suddenly overturned, and its occupants were seen struggling for their lives in the water. Three of them were rescued, but nothing could be seen of the fourth. Grappling-irons were procured, and the river dragged, but to no purpose: the man had evidently been drowned, and carried away by the tide. It was noble to see the efforts of the survivors to rescue their ill-fated companion, and it was pitiable to witness their grief when the attempt had to be given up.

Some hours later, three men in a second boat made their way up stream towards the scene of the overturning, and deposited by the river side, at a place where the tide might have left the drowned man's body, a corpse specially procured. Then they rowed down stream towards Greenwich. In the morning they were on the spot again; heard that a body had been picked up, and recognised it, amid many tears, as that of their friend. An inquest was held, a verdict of 'accidental death' returned, and a large sum in the way of insurance money was drawn. The missing man had not been drowned: he had swum under the water to the opposite bank; the tears were only crocodile's; and the body placed on the bank had been obtained from a hospital.

With his share the 'dead' man went to Paris, where he quickly spent it. Having a disinclination for honest labour, he thought he would 'do'

the companies a second time. He got to Liverpool, and there made an application to a London office for an insurance of two thousand pounds on the life of a gentleman, a commercial traveller, on whose behalf permission was sought to extend the privilege of travelling to America. The life was found to be a good average one, and the permission was given. Only a few months afterwards, application was made for the money: the insured gentleman had been drowned in one of the American lakes. Death and identity seemed clearly established, and the office signified its willingness to pay the money at the end of the usual three months. It transpired afterwards that this was all a cleverly worked swindle; the 'traveller' had not been out of England; and the American part of the business had been done by another rascal.

A man whose initials are given as C—D—insured his life for sums amounting to ten thousand pounds. A year afterwards, his death was represented as having occurred at one of our fashionable watering-places; and after a very full investigation, with the depositions of ten witnesses, who swore to their belief of his having been drowned, and of four additional, who proved his identity, the companies paid the sum on his policies. Two years after his supposed death, he turned up at his native place.

Very similar to this fraud was that of the landed proprietor who insured his life for fourteen thousand pounds, who was thought to have been drowned, his clothes being found on the banks of a deep river, and who really died five years later in America.

FULFILMENT.

ALL things fulfil their purpose, low or high;
There is no failure; Death can never mar
The least or greatest of the things that are;
Until our work is done, we cannot die;
When it is done, it matters not how nigh
May be the night-time that is never far,
That long ere sunset lights the evening star,
Throws its still shadow up into the sky.

To-day shall end what yesterday begun;
What we are planning others yet may build;
The leaves may wither, but the tree shall grow;
And though, at last, we leave our work undone,
Our life will not the less be all fulfilled,
Our work will all be even finished so.

THE HOUSE OF COMMONS LOBBY.

BY A LOBBYIST.

THE Lobby of the House of Commons to-day is a very different place from what it was, say, ten years since, or even less than that. At the present time the Inner Lobby—or Members' Lobby, as it is sometimes called, in order to distinguish it from the Central Hall—is reserved for members of the two Houses of Parliament and ex-members of the Commons. In addition to these there are a certain number of persons who may perhaps be called without offence professional politicians. They include the chief organisers and wire-pullers of the various political parties; journalists representing the chief London and provincial papers and the Press Agencies; a few Parliamentary agents; and others interested in the promotion of Private Bills; and the Private Secretaries of Ministers and ex-Ministers of the Crown, though not those of private members of Parliament. The names of these selected few are placed upon the lobby list which the Sergeant-at-arms controls, and which he can, and does, revise from time to time as may be thought fit.

But before the scare, or, as some prefer to call it, the alleged scare, that followed the dynamite outrages at Westminster and elsewhere in the last decade, the *entrée* to the Members' Lobby of the House of Commons was by no means a special or an exceptional privilege. Even to this day, indeed, when the exclusion of all 'strangers,' and persons having 'no right there,' is carried out almost to the point of fastidiousness by the officials, who certainly do not shrink from their duties in this matter—even to this day intelligent people may be found who will tell that they have a perfect right to enter the lobby because they were in the habit of doing so a few years since without any special license or order from Mr Sergeant-at-arms or Mr Speaker. The editor of a daily journal recently told me that he meant to go down to Lobbyland one day and look up some of his old friends in the House. I

assured him that to carry out such a project successfully he would have to procure an order from a member to see the precincts of the House. A ticket for the Speaker's Gallery, or for one of the choice seats 'under the Gallery,' would carry him through the lobby; but he would not be suffered to stand or walk about there for more than a minute or two. But my friend scoffed lightly at the idea of going to all this trouble for nothing. A few years ago, he declared, he was wont to come and go as he desired whilst the House was sitting. Lobby lists and lobby privileges he declined to believe in. Nobody used to stop him then; nobody was at all likely to stop him now. And yet I feel sure that that incredulous one has as good a chance of 'lobbying' under such conditions as he has of walking into the House itself, past Mr Jarratt, Mr Jennings, and past, in short, every watchful official, taking Mr Speaker's chair and putting the question on the night of a great party debate. Why, to win the narrow way leading from the Central Hall to the Members' Lobby, he would have to exert a strength at least equal to that of Sandow or Samson. Half-a-dozen stalwart constables and other officials would be on his track in a moment. He would be seized and ignominiously lugged back over the magic line. Even were he, by much guile and by deep-laid plots, to find his way through the swing-door of the lobby, his presence would be instantly noticed, and he would be chivied off in a trice.

The precise reason for this rigid exclusion of strangers from the Members' Lobby may not at first sight appear quite clear or quite reasonable; for people are, it may be argued, admitted to the Central Hall and elsewhere within the precincts of the House. After a very mild examination, they have merely to declare that they have come to look after a member, and to show that their bag—if they happen to have one—contains harmless matter. The dynamite scare, despite the alleged Walsall revival, can scarcely be said to exist at the present time; and even if it did, the accredited and recognised private secretaries of

members of Parliament would scarcely be excluded as possible members of a physical force brotherhood. But then, on the other hand, it may be admitted that the line must be drawn somewhere. If the public at the present time were to be admitted indiscriminately, the unfortunate member of Parliament would—especially if he represented a metropolitan constituency—be pestered out of his wits by clients on every conceivable errand and mission. There would be scarcely standing-room in the small Members' Lobby. The Sergeant-at-arms is therefore strongly backed up by the whole House in the strict manner in which he keeps the lobby clear of 'strangers.'

What, it may be asked by those who are comparatively unversed in the arts of party politics, and who never can make out how 'things get into the newspapers'—what is the precise use and object of this lobby which it is such a privilege for anybody save a member to enter? Well, the lobby has various uses and usages. It can still boast a neat little bar—a bar where good sound liquor is to be obtained at a moderate charge, together with various nutritious edibles, such as hard-boiled eggs, sandwiches, and light confections. At this bar, it is but fair to say, there has never been much drinking or 'standing' of drinks. Occasionally a wearied legislator would in the intervals of debate, or after letting off a speech, rush out thither, bolt a few morsels of food and dash off a glass of dry sherry or a small brandy-and-soda. Mr Balfour himself was in past sessions a familiar figure almost every day at the bar. The Chief Secretary would glide out of the chamber after the storm and stress of question-time, and restore the inner man with a glass of wine and a biscuit or a cup of the beverage 'that cheers but not inebriates.' In these, his biscuit and sherry moments he had a kind word and a welcome recognition for those of his colleagues who might desire a few moments' chat with him. It is related, indeed, that the bar was in special requisition during the debates upon the ill-starred Publicans' Compensation Clause in Mr Goschen's Bill of 1890. The weather was sultry at that period, it may be recollected, and the discussion often quite fiery. But we are going to change all this. The lobby bar, with its alcoholic liquors, its rice puddings—those puddings are said to be particularly good—and its light confectionery, is to be swept away. Local Option in the Commons will relegate it to a more secluded spot within the walls of Westminster.

The House of Commons lobby is a kind of recreation ground where members of Parliament may take a little mild exercise. The air here is perhaps purer and fresher in hot summer days than in the chamber itself, and there is room to stretch the limbs and take a small 'constitutional.' The party whips, notably Sir Herbert Maxwell, may be seen on most days when an important division is impending walking up and down the tessellated pavement; and one or two well-known members, such as Sir Henry Fletcher and Mr Broadhurst, clearly affect the lobby for purposes of health and gentle exercise. The terrace is more adapted for the latter purpose; but lately it has become somewhat unpopular, owing to the supposed prevalence of the dreaded influenza microbe on the river side of the House!

Then the lobby appears to possess a kind of pacifying and softening influence. Partisans who in the chamber itself seem to be on the most strained terms, and who often hurl defiance at one another across the narrow space which separates the two hostile armies, meet in the lobby and enter into amicable conversation. It is here that the 'black Tory' meets the 'New Radical,' and as likely as not accosts him with a friendly smile. Men seem glad to lay aside the garment of partisanship for a few minutes in the lobby and the tea and smoking rooms of the Lower House. See! there is Mr Labouchere conversing with Sir John Gorst. Both are chatty and affable. Mr Tim Healy has just come up and joined them; and presently Mr Walter Long, like Sir John a member of the Government, comes up and joins the trio for a few moments. Yet in the House, likely enough, the Liberal or the Nationalist member has just been fiercely attacking the Ministry; whilst it is almost certain that the member for Northampton will in his next platform speech describe the action of Her Majesty's Government as detestable. Party politics is clearly a game, and not an over-serious one either!

The lobby, needless to say, is the land of much light Parliamentary gossip. What course the Ministry or the leaders of the Opposition are going to take with regard to such and such a Bill, Motion, or Committee, is here discussed, and criticised by the private member with great zest. The lines of the Chancellor's next Budget are foreshadowed by the political prophets; and the latest rumour about a 'Cave' or revolt finds currency here if anywhere. A certain amount of this gossip is well founded; though the greater part is commonly described by Ministers (who do not love their programmes and policies to be forestalled) as 'totally unfounded,' or 'quite inaccurate,' or 'entirely misleading.' Few Ministers or members of the Government, with the exception of the whips, who are of course there in order to prevent members slipping away from divisions, are habitués of the lobby. They occasionally pass through it, looking quite bowed down and oppressed with national cares and responsibilities, always walking very fast, and usually having an armful of blue-books and Parliamentary papers. Occasionally they are called out thither to consult with one of their supporters from the Upper Chamber; and more frequently you may see them hurrying to and fro between the chamber and the little room sacred to the chief whip. But there is little opportunity of button-holing a Cabinet Minister in the lobby and drawing him into an explanation of the Ministerial policy. Nor do the ex-ministers affect the lobby greatly. The writer can only recollect having seen Mr Gladstone lobbying on one occasion during the present Parliament. Earl Spencer may be seen here occasionally; Sir William Harcourt a little more frequently; and from time to time Mr John Morley, Sir George Trevelyan, and Mr Bryce. Of Ministers, the figure of the Premier is the least familiar of all in the territory of the House of Commons. Perhaps he has seen enough of it in past times. The stalwart forms of Mr Whitbread, Sir William Barttelot, and Sir Charles Milner—all well above six feet in height—are

familiar here, as is the remarkable figure of Sir Richard Temple, whom *Punch* so loves to portray. The blind member for Ossory, led about by his little son, is rarely absent for a week together. He now remains, since the deaths of Mr Fawcett, once Postmaster-general, and Mr Robertson, the late member for Brighton, the single sightless legislator in the Lower House.

A few hours in lobbyland, when some important party question is expected to 'come on' in the course of the day, will give, indeed, a good idea of the personal side of the House of Commons. It has inspired the pen of many a journalist; for the lobby of the Commons is sometimes far more interesting, and far fuller of life and animation, as well as of members, than the House itself, with its fast-emptying benches, its bored and drowsy occupants, and its halt and hesitating speakers.

In conclusion. The Members' Lobby is seen to advantage in the earlier hours of the Parliamentary day, especially at about half-past four or five o'clock, immediately after Ministers have gone through the ordeal of question-time. The last question on the list disposed of, a goodly crowd of members come trooping out of the House for a short breathing-space, and the buzz of many voices sounds in the ear. But it is seen at its very best at the conclusion of some great party contest; or when a pre-eminent debater, such as Mr Gladstone, Mr Chamberlain, or Mr Balfour, having resumed his seat after a rattling speech, one of the regular brigade of 'bores' vainly strives to obtain a hearing from a satiated and fast-emptying House.

THE IVORY GATE.*

By WALTER BESANT.

CHAPTER XI.—A MYSTERIOUS DISCOVERY.

THE safe disposed of, there remained a cupboard, two tables full of drawers, twenty or thirty tin boxes. Checkley examined every one of these receptacles. In vain. There was not anywhere any trace of the certificates.

'Yet,' said Mr Dering, 'they must be somewhere. We have been hunting all the morning, and we have not found them. They are not in this room. Yet they must be somewhere. Certificates and such things don't fly away. They are of no use to any one. People don't steal certificates. I must have done something with them.'

'Did you take them home with you?'

'Why should I do that? I have no safe or strong-room at home.'

'Did you send them to the Bank for greater safety? To be sure, they would be no more safe there than here.'

'Go and ask. See the manager. Ask him if he holds any certificates of mine.'

The clerk turned to obey.

'No.' Mr Dering stopped him. 'What's the

good? If he held the things, there would have been dividends. Yet what can I do?' For the first time in his life the lawyer felt the emotion that he had often observed in clients at times of real disaster. He felt as if there was nothing certain: not even Property: as if the Law itself, actually the Law—was of no use. His brain reeled: the ground was slipping under his feet, and he was falling forward through the table, and the floor and the foundation—forward and down—down—down. 'What can I do?' he repeated. 'Checkley, go. See the manager. There may be something to find out. I can't think properly. Go.'

When the clerk left him, he laid his head upon his hands and tried to put things quite clearly before himself. 'Where can the certificates be?' he asked himself, repeating this question twenty times. He was quite conscious that if he had been consulted on such a point by a client, he would have replied with the greatest readiness, suggesting the one really practical thing to do. For himself he could advise nothing. 'Where can the certificates be? Nobody steals corporation stock and gas companies' shares. They are no good if you do steal them. They can't be sold without the authority of the owner: he has got to sign transfer papers: if they were stolen, the dividends would go on being paid to the owner just the same. Besides'—Somewhere about this point he bethought him of the Bank book. If the stock had been sold, the money would appear to his credit. He snatched the book and looked at it. No; there was no entry which could possibly represent the sale of stock. He knew what every entry meant, and when the amount was paid in: his memory was perfectly clear upon this point.

Checkley's suggestion occurred to him. Had he taken the certificates home with him? He might have done for some reason which he had now forgotten. Yes; that was the one possible explanation. He must have done. For a moment he breathed again—only for a moment, because he immediately reflected that he could not possibly do such a thing as take those securities to a house where he never transacted any business at all. Then he returned to his former bewilderment and terror. What had become of them? Why had he taken them out of the safe? Where had he bestowed them?

And why were there no dividends paid to him on these stocks? Why? He turned white with terror when he realised that if he got no more dividends, he could have no more stocks.

During a long professional career of fifty years, Mr Dering had never made a mistake—at least he thought so. If he had not always invested his money to the greatest profit, he had invested it safely. He did not get the interest that some City men expect, but he made no losses. He looked upon himself, therefore, as a man of great sagacity, whereas in such matters he was only a man of great prudence. Also, during this long period he was always in the enjoyment of a considerable income. Therefore, he had never known the least anxiety about money. Yet all his life he had been counselling other people in

* Copyright 1892 in the United States of America by Harper & Brothers.

their anxieties. It was exactly as if a specialist in some mortal disease should be himself attacked by it. Or it was as if the bo'sun, whose duty it is to superintend the flogging, should be himself tied up.

Nothing came to him: no glimmer of light: not the least recollection of anything. Then he thought desperately, that perhaps if he were to imagine how it would be if somebody else, not himself at all, were to come to himself and lay the story before him as a solicitor, for advice. Or how it would be if he himself were to go to himself as a solicitor and put the case.

When Checkley came back, he found his master leaning back in his chair, his eyes wide open and staring at him as he opened the door—yet they saw nothing. Checkley stood under the gaze of those eyes, which saw him not. 'Good Lord!' he murmured. 'Is the time come? Is he going to die?'

His face was white. He seemed to be listening anxiously: his lips were parted. 'He's in a fit of some kind,' thought the old clerk.

He stood watching. He ought, perhaps, to have called for assistance. He did not think of it. He stood and watched, his face as pale as his master's. Was it the end? If so—we all think of ourselves first—what about his berth and salary?

Suddenly his master's eyes closed: he dropped his head: he heaved a deep sigh: he moved his head and opened his eyes. He was restored to himself. The fit, whatever it was, had passed.

'Checkley,' he said, 'I've been trying to put the thing to myself as if some other man—a client—was putting his case to me. I began very well. The other man came—that is, I myself called upon myself. I sat and heard my own story. I forget, somehow, what the story was'—he shook his head impatiently. 'Forget—forget—I always forget. But I remember that it wasn't the story I wanted him to tell. It was another story altogether. He didn't tell me what I wanted to know. That is—what has become of the certificates. I'm no nearer than I was. He made out that I was actually selling the certificates myself.'

'You're wandering a bit,' said Checkley, anxiously watching him. 'That's all. You'll be all right presently. You've bin shook up a bit, with the certificates and the notes and all. If I were you, I'd have a glass of something stiff.'

'No—no; I shall come round presently. Yes—that's it. I'm a good deal upset by this business. Somehow, I don't seem able to think clearly about it. Let me see'—he sighed heavily—'I think you went somewhere—somewhere—for me, before—before the other man came.'

'For Lord's sake, don't talk about the other man. There's no such person. Yes—I did go for you; I went to ask the manager of the Bank whether he held any stock for you.'

'The manager of the Bank. True. Well, and does he hold anything?'

'Not a scrap. Never had any.'

'Then Checkley'—Mr Dering dropped his hands helplessly—'what is to be done?'

'I don't know, I'm sure,' the clerk replied with equal helplessness. 'I never heard of such a thing before in all my life. Thirty-eight

thousand pounds! It can't be. Nobody ever heard of such a thing before. Perhaps they are about the place somewhere. Let's have another search.'

'No—no. It is useless. Why—I have had no dividends. The shares were all transferred, and nothing has been paid for them. The shares have been stolen. Checkley, I can't think. For the first time in my life, I can't think—I want some one to advise me. I must put the case in somebody's hands.'

'There's your young partner—a chance for him to show that he's worth his pay. Why don't you consult him, and then come back to the old plan of you and me? We're knocked a bit silly just at first; but the case'll come to us in the long run. You would have a partner—nothing would do but a partner. The boy's in his own room now, I suppose, with a crown upon his head and the clerks kneelin' around—as grand as you please. Send for him.'

Mr Dering nodded.

The partner, when he arrived a few minutes later, found the Chief walking about the room in uncontrollable agitation. On the table lay piled the whole contents of the safe. In front of it stood the ancient clerk, trembling and shaking—head, hands, knees, and shoulders—following the movements of his master with eyes full of anxiety and terror. This strange fit, this forgetfulness, this rambling talk about another man, this new restlessness, frightened him.

'You are come at last.' Mr Dering stopped and threw himself into his chair. 'Now, my partner, hear the case and resolve the difficulty for us, if you can.—Tell him, Checkley—or—stay; no. I will tell it myself. Either I have lost my reason and my memory, or I have been robbed.'

George stood at the table and listened. Something of the utmost gravity had happened. Never before had he seen his Chief in the least degree shaken out of his accustomed frugidity of calm. Now he was excited; his eyes were restless; he talked fast, he talked badly. He made half-a-dozen attempts to begin: he marshalled his facts in a slovenly and disorderly manner, quite unlike his usual clear arrangement: for fifty years he had been marshalling facts and drawing up cases, and at his own he broke down.

'I think I understand the whole,' said George, when his Chief paused and Checkley ceased to correct and to add. 'You had certificates representing investments to the amount of £38,000: these are gone, unaccountably gone: no dividends have been paid for some months, and your broker speaks of large transfers.'

'That's not all,' said Checkley. 'Tell him about the notes.'

'Yes. The fact may have some bearing upon the case. While we were looking for the certificates, and in order, I suppose, to complicate things and to bewilder me the more, we found in the safe the very notes—give me the bundle, Checkley—there they are—that were paid over the Bank counter to the man who forged my name eight years ago.'

'What? The case in which Athelstan Arundel was accused?'

'The same. There they are—you hold them in your hand—the very notes! Strange! on the

very day when I am threatened with another and a worse robbery! Yes—yes; the very notes!—the very notes! This is wonderful. Who put them there?

'How can I know?'

'Well—but in any case one thing is certain. Athelstan's name is cleared at last. You will tell his mother that.'

'Not at all,' said Checkley. 'Why shouldn't he put 'em in himself? I saw him edging up towards the safe'—

'Saw him edging—stuff and nonsense! His name is cleared. This will be joyful news to his mother and sisters.'

'Austin, get me back my certificates,' said Mr Dering; 'never mind those notes now. Never mind the joyful news. Never mind Athelstan's name; that can wait. The thought of him and the old forgery only bewilders my brain at this juncture. I cannot act. I cannot think. I feel as if I was blinded and stupefied. Act for me—think for me—work for me. Be my solicitor, George, as well as my partner.'

'I will do my best. It is difficult at first to understand—for what has happened? You cannot find—you have mislaid—certain papers. Certain dividends which were due do not appear to have been paid: and your brokers, Ellis and Northcote, have used a phrase in a letter which you do not understand. Would it not be well to get them here; or shall I go into the City and ask them exactly what they meant and what has been done?'

'If I could remember any transactions with them during the last six months. But I cannot, except a small purchase of Corporation stock last month—a few hundreds! And here are the papers belonging to that.'

'Which of the partners do you deal with?'

'The old man, Ellis—he's always acted for me. He has been my friend for close on fifty years.'

'Well, I will send for him, and tell him to come as soon as possible, and to bring along with him all the letters and papers he has.'

'Good, good,' said Mr Dering, more cheerfully. 'That is practical. I ought to have thought of that at the very outset. Now we shall get along. The first thing is to arrive at the facts—then we can act. If it was another man's case, I should have known what to do. But when it is your own—and to lose the certificates, and when a sum of nearly forty thousand pounds is at stake—it looks like losing the money itself—and the feeling of uncertainty'—

'All taken together, becomes rather overwhelming. Of course I should like to see the letter-book, and we must run through the letters to see if they throw any light upon the business. Perhaps the papers themselves may be found among them.'

The presence of this young man, cheerful, decided, taking practical measures at once, cheered up the lawyer, and steadied his shattered nerves. But Checkley the clerk looked on gloomily. He replaced the papers in the safe, and stood beside it, as if to guard it; he followed the movements of the new partner with watchful, suspicious eyes; and he muttered sullenly between his teeth.

First George sent a telegram to the City for the broker. Then, while the old clerk still stood

beside the safe, and Mr Dering continued to show signs of agitation uncontrollable, sometimes walking about the room and sometimes sitting at his table, sometimes looking into the empty shelves of the safe, he began to look through the copied letters, those, that is, which had gone out of Mr Dering's office. He searched for six months, working backwards.

'Nothing for six months,' he said.—'Checkley, give me the letters.' He went through these. They were the letters received at the office, all filed, endorsed, and dated. There was not one during the letters of six months which he examined which had anything to do with the sales of stocks and shares.

'If,' he said, 'you had written to Ellis and Northcote, a copy of your letter would be here in this book. If they had written to you, these letters would be among these bundles. Very well. Since no such letters are here, it is clear that no such letters were written. Therefore, no sales.'

'Then,' said Mr Dering, 'where are my certificates? Where are my dividends?'

'That we shall see. At present, we are only getting at the facts.'

Then Mr Ellis, senior partner of Ellis and Northcote, arrived, bearing a small packet of papers. Everybody knew Mr Ellis, of Ellis and Northcote, one of the most respectable stock-brokers in London—citizen and Loriner. He belongs eminently to the class called worthy: an old gentleman, carefully dressed, of smooth and polished appearance, pleasing manners, and great integrity. Nobody could look more truly *integer* *valie* than Mr Ellis. Nor does his private practice belie his reputation and his appearance. His chin and lips looked as if they could not possibly endure the burden of beard or moustache: his sentiments, one observed at a glance, would certainly be such as one expects from a citizen of his respectability.

'Here I am, dear sir,' he said cheerfully—'here I am, in immediate obedience to your summons. I hope that there is nothing wrong; though your request that I would bring with me certain papers certainly made me a little apprehensive.'

'There is, I fear, a good deal wrong,' said Mr Dering. 'Sit down, my old friend.—Give Mr Ellis a chair, Checkley.—Austin, you will tell him what he wants to know.'

'You wrote to Mr Dering yesterday recommending a certain investment'—

'I certainly did. A very favourable opportunity it is, and a capital thing it will prove.'

'You mentioned in your letter certain transfers and sales which, according to your letter, he had recently effected.'

'Certainly.'

'What sales were they?'

Mr Ellis looked at his papers. 'February last—Sale of various stock, all duly enumerated here, to the value of £6500. March last, sale of various stock, also all duly enumerated, to the value of £12,000 odd. April last, sale of stock to the value of £20,000—more or less—realising'—

'You note the dates and amounts, Austin?'

said Mr Dering. 'Certainly. We will, however, get the dates and the amounts more exactly in a moment.—Now, Mr Ellis, of course you received instruc-

tions with the papers themselves. Were they in writing or by word of mouth?

'In writing. By letters written by Mr Dering himself.'

'Have you got these letters with you?'

A FADED PALACE.

THERE are in some suburbs of London neighbourhoods where one may meet with terraces, streets, and squares whose houses bear the palpable symptoms of having fallen from a high estate to baser uses. An air of faded gentility hangs over all, inducing a feeling of sadness, even though the spectator be the least reflective of his kind. Such a sentiment is intensified a hundredfold when in place of a row of shabby-genteel dwellings, whose former inhabitants never rose above mediocrity, one contemplates a building within whose walls history has been made, and great ones of the earth have gathered together, given over to silence and desolation, if not actual decay. Even in busy London many such might be discovered; but nowhere probably in England could a more striking example be found than at that elysium of Bank-holiday Cockneyism on the banks of 'Thames' silver flood'—Hampton Court. It is but an hour's journey from the bustling Strand; yet one may pass through its echoing saloons with no further company than the smirking 'beauties' and stolid cavaliers who gaze from the canvas of Lely, Holbein, or Zuccherò. Sundays, however, must be excepted, for does not the youthful son of toil then come with his Dulcinea to feast the sight on works of bygone art, and, perchance, to snatch the fearful pleasure of a moment's courting in sly corners which have listened to the sentiments of be-furrowed courtiers and the rustle of fluted fans!

These lofty rooms, on whose panelled walls the festoons look as fresh as the day they left the carver of Gibbons, whose majestic mantel-pieces still stand brilliant in their statuary marble, and whose old Delft ware and Dutch stove-backs recall the monarch who left a 'glorious, pious, and immortal memory' to the natives of London-derry, are full to overflowing with recollections of a stately and brilliant past. As one passes from the 'King's Guardroom' to the 'King's Drawing-room' and the 'King's Bedchamber,' and so on through apparently interminable apartments, there appear before the mind's eye crowds of men much bewigged and belaced; of women in satin and diamonds, stately, courteous, and severe, trying, as it were, to sink the memory of the profligate following of 'Old Rowley;' and the miserably bigoted one of Queen Mary's unhappy father in the pleasing decorousness of William of Orange's court. Poor man! Did he really have to sleep in that dreadful bed beneath the ceiling resplendent with the 'sprawling saints' of Verrio and Laguerre? How very uncomfortable must have been his slumber in that gigantic structure with its lavender brocade and plumes of feathers! It stands now in curious company for so decent a liver as the victor of the Boyne. By some strange anomaly, they have hung Charles's fair ones round the walls, those simpering, attitudinising frailties, whose portraits make one wonder, not that the court of England was then so wild

and base, but rather how it managed to keep even as decent as it did.

And Queen Mary, she, too, was doomed to repose in a bedstead of almost equally terrifying proportions, which recalls that graceful little anecdote of Dutch William's first introduction to his cousin, how the young Prince stood bowing to the juvenile lady as she lay in her bed—perhaps just such another as this one—to the amusement of the parents concealed behind the curtain. It is a little gleam of romance shed on a life not much associated with aught but stern realities. It was to Hampton Court the king was riding when his horse made that fatal stumble which gave us 'Good Queen Anne;' and he was first carried to his apartment there, though insisting to be removed the same night to Kensington, despite the danger—why, one cannot say, unless that ceiling was too much for his nerves.

A great charm of these desolate rooms is the odd and unexpected manner in which one comes upon stray ornaments or pieces of furniture in all sorts of dark and out-of-the-way corners. An armoire, a cabinet, or a folding-table, it may be, looking as though never disturbed for these two hundred years; while in one dark corridor a clock—without hands—seems in its monotonous ticking to be a very echo of the past, and may not improbably have been going there through all its existence without winding up.

After all, though, it is the pictures one comes to Hampton Court to see. A few there are very good, some atrociously bad, and many indifferent. There is one portrait of Henry VIII., which is perhaps the most interesting of the whole collection. The king is seated beneath a canopy whose decorations show Holbein in every curve. One hand rests on the shoulder of his puny son; Jane Seymour sits stolidly near; while to right and left stand Elizabeth and Mary, the latter's placid countenance showing few of those characteristics which earned for her as queen so unenviable an adjective. Through an opening to the right we see Henry's court fool, Will Somers, with a monkey on his back; while to the left the mountebank's spouse completes the septette. It is altogether a stilted and stiff production; but what a portrait of the king! One may fairly assume it to be an accurate likeness; and if so, what a wretch he must have been. Sensuality and cruelty appear to struggle for the mastery in this visage, which the German painter has left on canvas for us to study and be warned by.

Near to this is Elizabeth 'in a fancy dress,' from the brush of Zuccherò. If the Virgin Queen were anything like this angular auburn virago, her poets and courtiers must indeed have been, to put it in vulgar nineteenth-century English, humbugs of the first water.

Raphael is here, limned by his own hand, a picture which acts as a shock to those who have imaged the divine painter of Urbino as a handsome man. Of the Carolian ladies, the best known and least respected of the painted assembly at Hampton Court, one can but fancy that the painter has certainly not erred on the side of fidelity in his endeavours to please their royal patron. They *cannot* have been so very much alike; though, doubtless, the taste for scanty clothing was not peculiar to one. Very different in

this respect are those spick-and-span portraits by Lawrence and Romney which fill one room. Here is 'Farmer George' as a field-marshal on a prancing charger; while his scapegrace son waves a sabre with an arm very much out of drawing. Queen Charlotte, too, looks complacently down, as though to say: 'See! I am in my Sunday clothes, and the artist has made the most of them.' But what does this lady here who looks so pleasantly at you out of a graceful oval frame? 'Madame de Pompadour, by Greuze.' This delightful bit of painting evokes memories more splendid, and yet almost more painful, than is the case with any other in the whole gallery, unless it be that magnificent full-length of Louis Seize which faces his father's 'belle amie.' She looks a fitting sample of the careless, graceful folly of her time, as she sits at tambour-work in a flowered silk gown; but how this favourite of Louis le Bien Aimé came to find a home in this solemn prosaic palace is a mystery. Was this delightful Greuze a spoil of war, or was it a New-year's gift to Madame de Walmoden? Certain she looks sadly out of place in an apartment where perchance Caroline of Anspach played cards on that evening when her ill-fated daughter-in-law was dragged off by 'Fred, who was alive and is dead,' to give birth to a child an hour or two afterwards at Kensington.

Lord Hervey fluttered through these rooms and filled them with small-talk; hither Walpole brought the latest politics; while 'Son Horace's' letters were doubtless read and admired by Mary Bellenden and her companion maids of honour; and all in these small, uncomfortable apartments, where now the dust accumulates and the holiday lounge drops crumbs from his sandwiches. Portraits, indeed, of past and gone notables surround one: Pale-faced Philip of Spain, by Velasquez; Charles the Unfortunate of England, very regal on his charger, yet with a far-away, sorrowful expression, as though he partly foresaw that chilly morning at Whitehall. It is a noble picture. Who but Van Dyck could have painted it? Then there is that equally unfortunate and poetical nobleman, the Earl of Surrey, who, if he ever appeared before the fair Geraldine in the startling red costume in which the artist has depicted him, must have made that lady's eyes blink again. He hangs alone in a gallery whose walls are else covered with 'worm-eaten tapestry.'

If the visitor have a taste for 'fancy subjects,' he may feast to surfeiting: Venuses with redundant charms, Diana and the hunted Actæon, nymphs, graces (and disgraces), and a whole progeny of classical, semi-classical, and pseudo-classical beings cover the walls, some languishing from the graceful pencil of Correggio, others with an amplitude of proportion and ruddiness of hue traceable only to the brush and palette of Rubens. And so one wanders on through a succession of little chambers, each darker and dingier than its predecessor, mere closets, whose gloom suits best the canvases hung there, although a few charming Lancrets are cruelly stowed away 'out of sight' and probably 'out of mind.'

From the windows there is a view of a quadrangle so quiet and so deserted that one can hardly realise the time when laughter echoed

through the arcades, and gay scarfs fluttered in what little sunshine could creep to the fountain in the centre. The circular frescoes which are over the windows have long since faded into one nondescript tint, and modern hands are carving fresh heads on the entablatures of the arches, grotesque masks which in their whiteness stand out startlingly, the only modern handiwork on this old forsaken spot.

What is left of the Tudor portions of the palace is picturesque enough; yet one regards it more as an architectural curiosity than a place where men and women have lived, loved, and suffered. The time is so distant, and we know really so little of it, whereas that other and newer age is to some extent still in touch with our own. We can feel with its people and appreciate their doings, which is the reason why William's Hampton Court is more interesting to us than Wolsey's.

Below the old square tower with its quaint clock, and we are on Hampton green again. The busy bridge and boat-covered river recall us from the hour spent with the past, and we leave the faded palace to those residents who, themselves being living remembrances of former splendour, are possibly the most suitable inhabitants for such a place.

A BOYCOTTED BABY.

IN FIVE CHAPTERS.

By P. L. McDERMOTT, Author of 'Julius Vernon,' &c.

CHAP. I.—THE MARRIAGE.

TWENTY-FIVE years ago Matthew Bulbous had forsaken the plough in his native parish and come up to London to make his fortune. His education consisted of a good knowledge of the value of land, and of little more; but the deficiency was supplied by a hard head and a determination to make all the money he could at the expense of others; for he had no capital to start with beyond a couple of hundreds which he borrowed to open an office and advertise it.

He made his fortune. When he commenced business as an 'estate agent, auctioneer, and valuer,' money was being made in the nation at a rate almost unprecedented, and the 'new men' wanted country estates to give them position and social consequence. Hence there was great buying on the side of the rich, and selling on the side of the embarrassed; and there was correspondingly great business on the part of the agents. To avail himself of this tide of business prosperity Matthew Bulbous worked hard, and his energy and determination had their reward. Then came a turn in the tide, when business grew depressed, and rents could no longer be paid as of old, and estates, old and new, came crashing into the market. Matthew Bulbous found this state of ruin as profitable as the former spell of prosperity. Estates had to be sold, instead of bought; and before they left his hands, Matthew Bulbous wrung from them the last guinea he could extract for surveys, valuations, reports, expenses, and commissions; and many a hapless seller turned pale when Bulbous and Bore's account was presented to him, with the amount already deducted from the 'deposit'

which it is customary for the agent to receive from the purchaser. As for the partner Bore, Matthew Bulbous had devoured him years ago.

Matthew was a rich man now, and—in his spare hours—a man of great local standing at Blackheath—churchwarden, chairman of meetings, a tower of eminence in the locality. He kept a fine house, had a wife and daughter, and a son who resided in chambers in London and was reading for the bar. This son was his great hope, and in him all his ambition was centred. He had been foolish enough once to take a house in town for the 'season,' with the desire of making a position in society. In such a case a man is made or marred by his wife. Matthew Bulbous did not spare money in this matter. But Mrs Bulbous failed. She was not worthy of him. She was shy and timid, incapable of rising to the position provided for her. Her daughter was formed of the same abject material. Mr Bulbous thenceforth despised them both, and centred all his hopes in his son. Matthew Bulbous had a great deal to do with gentlemen in the way of business, and was a good judge of one. Being uneducated himself, he strenuously held that a gentleman was not made by education but by 'blood.' When his son James left the university, Matthew perceived that he was undoubtedly a gentleman as well as a scholar, and the fact furnished him with food for a good deal of thought.

'If I have failed myself,' was his frequent reflection, 'through his mother's incapacity, Jem shall make up for it. I will take care that he marries blood!' Which meant that the son should not be matrimonially handicapped, as the father had been.

Fortune—which, in the case of such men as Matthew Bulbous, means the quick and resolute seizure of opportunities—favoured his aspirations. Whilst the young man was reading law, his father, all unknown to him, was arranging for him a matrimonial alliance with the daughter and only child of an Earl. To be sure, from another point of view, the match might not be thought brilliant; but an Earl's daughter is not to be had every day. Lord Polonius was a man of shady reputation, who found himself obliged to bring his burdened patrimony into the market. The estate was mortgaged for more than it was now worth, and little likely to attract a purchaser. After lying on his hands for some time, an idea gleamed upon Matthew Bulbous of buying the estate himself and giving it to his son. Jem was a gentleman and would fit the position. The position, too, would give him an added advantage. Now, in his own line, quite unsuspected by Matthew Bulbous, Earl Polonius was quite a match for that sharp man of business. He penetrated the man's ambition, and astutely turned it to his own advantage. To the last day of his life Matthew Bulbous will never be able to recollect clearly what it was that first suggested to him the idea of starting his son in life as the husband of Lady Jessalinda St George, or how it was that he and Lord Polonius first understood each other's views on the subject. It was probably due to the superiority of the Earl's genius; but this does not matter. Matthew Bulbous bought the estate of Kirby St George, and was obliged, under the special circumstances, to give Lord Polonius ten

thousand pounds over and above the amount of the mortgages. This transaction ratified the agreement between them that, subject to the concurrence of the parties, Lady Jessalinda and Mr James Bulbous should be married—the latter assuming, by the generous condescension of the Earl, the family name and arms of St George.

Matthew Bulbous was a very proud man one morning to find on his breakfast table a polite note from the Earl asking him to dine at Hanover Square to be introduced to Lady Jessalinda. This meant that Lady Jessalinda had given her consent, which Matthew had quite expected, of course, knowing Lady Jessalinda's age and prospects.

'I'm going—ahem—to dine with Earl Polonius, and his daughter, Lady Jessalinda St George, this evening,' he observed to his wife and daughter with a bad assumption of nonchalance.

Mrs Bulbous, a gentle and very sweet-faced lady, and her daughter started with a faint 'Oh!' and looked at the master in some anxious doubt as to what was expected of them in the way of reply.

'I just mentioned it,' he said carelessly, 'because I shall ask them to dinner here one day next week, and I expect you to be prepared.'

'Shall there be any others, Matt?' the wife timidly asked.

'No, except Jem. It will be quite a private family affair. You needn't be nervous about it, because—— But that's enough for the present.'

He left the room, but soon came back, which showed that the great matter was more in his mind than he desired them to suppose.

'Of course,' he remarked, 'you are not so familiar with the higher ranks as I am—meeting them every day in business, and all that—so that you must not be fussy or nervous. Put on some dignity, and be at your ease, as if you were used to it. I'll bring home a book for you both to study up. I won't have them think,' he added firmly, 'that we are overwhelmed with the honour. I'll—I'll have my eye upon both of you, remember. Lord Polonius and Lady Jessalinda are getting the best of the bargain, as you shall see in good time. That's all,' he said, turning to go away. 'Except this, Mary: you are not to call me "Matt" when they are here—it isn't the thing. Call me "Mr Bulbous," or—or,' he added, somewhat doubtfully, 'or "Mr Bulbous, my love," if you like; and I will do the same. Of course Agnes will not speak unless she is spoken to.'

Leaving the two ladies a little pink in the face, he went away to his business. It was mysterious to them, but they had to await his pleasure to explain what it meant. Bulbous was cross and impatient when he came home in the evening to dress, because he was conscious of being nervous and of betraying it. He had never before been an invited guest at a lord's house. He was to be the only guest, too, which, to begin with, was not giving him what he considered a fair start. Matthew Bulbous was thinking less of Lord Polonius and Lady Jessalinda than of the terrible, silent, observant menials.

When he returned at half-past eleven, it was plain to be seen that the dinner had gone off

well; perhaps Matthew Bulbous had discovered hitherto unknown powers of rising to the occasion. He had dropped into a club on his way home, and casually mentioned to several men he knew that he had been dining with Earl Polonius and Lady Jessalinda; he had even hinted at more. He was therefore in good humour when he got home.

'Mary,' he said to his wife, as he flung himself in an easy-chair and stretched out his legs, 'did you ever know me to fail in anything that I undertook?'

'No, Matt,' was the gentle reply.

'I never yet,' he continued reflectively, 'got my eye on a property that was doomed for the market that I didn't in the end have the selling of it and all the business the thing was worth—ay, though I waited for years, never losing sight of it for a day. That's the way to succeed: be patient, keeping steady on the track, and you'll run down your game in the end. Well, I have succeeded again. It's a big thing, but I have succeeded.'

'I am sure you have, Matt, whatever it is.'

'But you don't dream what it is. What's the good of being rich if you can't stand high? If it hadn't been for— Well, there; I won't talk about it now,' he said generously, noticing the look of pain in his wife's face. 'That was a failure; but if you are not capable yourself of succeeding, why shouldn't your children rise? Isn't Agnes there, with a bit of money, good enough for any swell in the Guards, I'd like to know, if she only had the ability to work herself up? But she hasn't, and we'll have her wanting to marry an attorney or something of that sort, one fine day. That's how they treat us.'

Mother and daughter exchanged a glance and inwardly trembled; for they had a dread secret between them relating to a curate, which it was terrible to think of Mr Bulbous discovering.

'What do you suppose, now, is going to happen?' he said, after a pause. 'Jem is going to marry Lady Jessalinda St George, Earl Polonius's only daughter and—and heiress,' he thought it as well to add, to round off the description. 'What do you think of that, now?'

Matthew Bulbous had a very large and deep mouth, ordinarily concealed underneath a heavy moustache. Now, as he lay back enjoying the effect of this announcement upon his wife and daughter, that feature extended itself in a smile which lent a startling expression to his face.

'And there's another thing,' he continued at breakfast next morning, 'only I don't want it talked about just yet. I never thought of doing such a thing before, but I'll do it now: I'll do my part to act up to the new position. If I don't succeed in this thing,' he added, with a confident smile, 'it will be the first failure of my life.'

'You could not fail, Matt,' said the meek wife deferentially.

'I'll hardly fail. I'm going in for Parliament, then; that's what it is. The member for this division is going to be made a judge. I mainly helped to carry his election; and it will be odd if I can't carry my own. I've promised Polonius,' he said familiarly, 'and he will get

me the official support of the Party. Jem, of course, goes in for his county the first vacancy.'

These matters being above the understanding of the ladies, were put out of their thoughts the moment he left the house. The absorbing subject of Jem's marriage engrossed them.

'Lady—Jessalinda—St George!' said Agnes Bulbous, below her breath.

Mrs Bulbous said nothing, being engaged with her thoughts. Perhaps she would have better liked her son to find a wife lower down in rank; perhaps she had a mother's misgivings as to the happiness likely to result from this kind of marriage, but of one thing she was certain: her son Jem was worthy of a princess.

Meanwhile Agnes had brought in a large gilt book from her father's room, and was turning eagerly over the pages. 'Here it is, mamma. "Claudius Hector D'Erebus Henry Maximilian, fourth Earl and Baron"—let me see; oh, yes—"married 13th March 1852 the Honourable Georgiana Lucia Louise Tremendus (who died August 1854), and by her had issue, Lady Jessalinda Hesperia Gwendolen Alice Georgiana"—good gracious, mamma!' Agnes looked pale.

Leaving the ladies immersed in the interesting discovery that Lady Jessalinda had reached the mature age of thirty-five, let us follow Mr Bulbous to London.

When a man rises to a higher sphere, he owes to it the duty of lopping off all connections which are not calculated to adorn that elevated plane. One such Matthew Bulbous had in his mind this morning to be rid of at once. This was a brother, who in several ways had been useful to him in his business for a number of years; but who, on his usefulness ceasing with the fuller growth of the house, had taken to dissipation on an allowance made to him for that purpose. Joseph Bulbous proved of tough vitality; but Matthew would not now have him about London any longer.

Matthew found this brother in a lodging in Chelsea, sitting over a fire after a late breakfast.

'I don't think this life is doing well with you, Joe,' he said, sitting down and looking curiously at the dissipated face of his brother. 'You asked me, once, to send you to Canada. Perhaps I ought to have done so—I hardly know.'

The colour rose for an instant to the other's forehead, and faded again. 'If you had sent me then,' he replied, without looking up, 'it might have been different. I don't think it matters now. I am hardly fit to make a new start; though, if it comes to that,' he added bitterly, 'I have never made one.'

'No, you never have. It wasn't in you, Joe.'

'Wasn't in me?' answered Joe, with a flash. 'Have I ever had the chance? If you had left me at home on the farm, I might have done well enough. But you wanted me for your own purposes; and after making use of me all those years, and allowing me no chance of doing anything for myself, you say—it wasn't in me! No one knows better than you, Matt, whether I've ever had a chance or not. It didn't suit your interests to let me find one; and like a fool, I did your work, until you used up the best part of my life.'

'Well, I am going to give you a chance now,' replied Matthew, not in the least moved. 'You

are of no use to yourself or anybody else in England. I will send you to one of the colonies.'

'It is not from any interest in me that you propose doing so,' said the other, who knew his brother well. 'Suppose I refuse to go?'

'Then you may starve. I daresay they would pitch you out of here in a week,' observed Matthew quietly. He knew his power over the broken-down man, and so did the latter.

Joseph Bulbous turned pale, and gave his brother a look which indicated more hate than fear. He made one or two efforts to speak, but evidently the quiet masterful presence of his brother was terrible to him. Then he turned quickly to a cupboard where there was brandy, and with shaking hand swallowed a draught of the liquor.

Matthew smiled under his heavy moustache; he saw how beaten the poor creature was.

'If I swallowed half of that stuff in the morning, Joe,' he observed good-humouredly, 'I should be fit for nothing all day. Joe, what an inside you must have!'

'Never mind,' said Joe, grown calmer. 'I don't mind saying I am quite ready to go. But why? At anyrate, I have never betrayed your confidence.'

There was no particular reason why Matthew Bulbous should make known to his brother the great family matter. But it gratified him to unbend a little, contrasting his own splendid success with the broken brother's abject failure.

'I am giving Kirby St George to Jem. He is going to marry Lady Jessalinda St George, and to assume the family name and arms. I am going into Parliament myself, and Jem will be in the first time there's a vacancy in his county. What will they think of all that, now, down in Bullworth?'

Bullworth was their native place. Matthew smiled widely as he spoke. Joseph ran his fingers through his thin unbrushed hair and for a minute looked dazed. He saw now why Matthew wanted to be rid of him. He was an undesirable connection. Yet he was naturally a cleverer man than his brother, and felt very bitterly that he had helped largely—in ways Matthew could not follow—to make that fortune, of which this was his share.

Now, as Joseph Bulbous realised the position, a gleam of quick intelligence shot from his rheumy eyes. Whilst Matthew was gazing at the ceiling, full of ambitious thoughts, his brother quietly flung a bombshell at his feet which blew the strong man in pieces through the roof. 'Matt,' he said, 'Jem is already married!'

Matthew Bulbous was blown very high indeed—into the very clouds—and it took him a considerable time to collect himself and return to the scene of the explosion. Then it struck him that the whole thing must have been merely a half-tipsy joke. 'It was the brandy, I suppose,' he remarked, wiping his forehead, 'that suggested that to you, Joseph. But it wasn't a very nice trick. Don't do it again. I'll let it pass for once; but you know I'm not a man to appreciate practical jokes.'

Joseph Bulbous knew of old how easy it was to frighten the tyrant of the family, though it was a dangerous thing to do. But at present he was on strong ground. James Bulbous was

married—had been six months married—as the father would have learned had he deemed it necessary to consult the son regarding the new matrimonial arrangement.

His face darkened. He rose and reached his brother with a stride, and grasping him by the collar, jerked him to his feet and shook him fiercely.

'Hands off!' cried Joseph Bulbous quickly, in a suppressed voice which sounded dangerous. Matthew at once dropped his hands by his side. 'Go and ask him.'

'Married—Jem married!' the elder brother exclaimed. He paused, for time to realise the possibility of so daring an act. He walked to the end of the room and back again, and then asked, in an ominously collected voice: 'Where does she live?'

'They have a small house—— No; I don't think I'll tell you just at present,' he answered, attentively regarding the other's eye. 'Go and see Jem, and let him give you the address, if he likes.'

Matthew Bulbous laughed. 'You ass! do you fancy that I would attempt her life?'

Whatever he thought, he gave no direct reply to this; but after thinking a minute, observed, with a grin: 'I think you had better, Matt, for your own sake, not seek to see Mrs Jem. She's a terror.'

'A—what?'

'A terror, Matt,' was the grave reply, 'especially when she is under certain influences. She'd tear you. Poor Jem; it is always the best sort of fellows they catch; but she was (and is still) good-looking—there's no denying that. No, no; take my advice, and give Mrs Jem a wide berth.'

Matthew Bulbous asked no more information. Joseph stood at the window watching the cab with a smile of malicious satisfaction as his brother drove away. 'That's one for you, Matt,' he remarked. 'I hope it will do you good.'

The revelation of his son being married, which he did not for a moment doubt, was a tremendous blow to Matthew Bulbous. Such defiance of his authority he had never thought of as possible. He was not a man to look for gratitude; but in return for all he had done for his son, he did claim unquestioning submission to his will and pleasure in all things. It was his undoubted right, he argued; and consequently he had looked for his son's acquiescence in the marriage scheme as a matter of course.

'Where should he be now,' said Matthew to himself, 'if it wasn't for me? Why, at the tail of a Bullworth plough!'

And to think of a young man who by rights ought to be ploughing the fields, defying his father by marrying a music-hall actress, and thereby frustrating his father's design of making him a country gentleman and the husband of an Earl's daughter—it was too much to bear thinking of.

Yet when he reached his son's chambers he looked cool and quiet. There was not a sign of disturbance in his large steady eyes. Jem was a handsome young man, very like his mother and sister, and rose quickly when his father entered the room. The latter, however, did not sit down or remove his hat.

'I have just heard something that has surprised me,' he said very quietly. 'Is it a fact that you are married?'

James Bulbous started, changed colour, and dropped his eyes for a moment. Then he looked frankly in his father's face. 'I ought to have told you, father. I am ashamed both before Gertrude and you not to have done so. Yes, sir; I am married.'

Matthew examined the pattern of the carpet for a few seconds. 'Have your mother and sister been aware of this?'

'No, sir.'

'Very well. You have taken your course. You have no further claim upon me.'

That was all. The young man reddened and inclined his head. Matthew Bulbous walked from the room, pausing to inspect an engraving on the wall, and drove away to his office.

It was over, as far as the son was concerned. But the blow struck Matthew Bulbous harder in another quarter. Lord Polonius would have to be informed of the downfall of the marriage project. His lordship would doubtless be disappointed; but Matthew realised with bitterness of heart the polite equanimity with which Polonius would bear it. He had ten thousand pounds of Matthew's money to console him, and the ten thousand maledictions now accompanying the money would disturb his lordship very little. This was the keenest agony of it; the wily old Earl had beaten him.

Jem was married. The curses, deep and silent, breathed by Matthew Bulbous on their wedded life, were tempered only by the vindictive satisfaction with which he reflected on what the woman was. The more reason the son had daily to repent of the marriage the greater would be the father's gratification. Matthew knew the kind of creature she was—knew the life she would lead her husband now that the liberal money supplies were cut off. He laughed aloud, thinking of it. It was his only comfort.

A GLIMPSE OF LIFE IN BRITISH COLUMBIA.

So much has been said and written about this favoured district on the Pacific coast, that there is little fear on hearing its name to-day that any one will say, as happened a few years ago: 'Oh, let me see—that is in South America, is it not?' Still, I think, unless one has had some personal experience of the place, it is difficult to realise how much, and yet how little, life in British Columbia resembles that in England. As it fell to my lot to spend some months on a ranch, many of the points of dissimilarity were perhaps made more noticeable at first than the likeness between this colony and the mother-country.

My husband and I sailed from Liverpool on the 11th of May, and after an easy and comfortable journey of sixteen days' duration, we arrived at our destination, New Westminster, where it was necessary to stay a few days before proceeding to our own home. Here we found my brother waiting to meet us, and with him we went at once to the lodgings he had taken for us, in a quaint but

pretty wooden house, built, as is so much the custom in this country, with the dining-room opening out of the kitchen, and acting as a sort of passage-room—an uncomfortable arrangement in many ways, but useful in saving footsteps in a place where it is almost impossible to obtain domestic help. After a luncheon of Fraser River sturgeon, which was fried like veal cutlets, and tasted delicious, I was taken to see the beauties of the place. New Westminster on that occasion looked charming, for all the fruit-trees were in full blossom, the sky of a deep intense blue, while the snow-clad summits of the Cascade Range were reflected in the depths of the Fraser River, at this point nearly a mile broad.

We passed a pleasant afternoon laying in stores, and buying some chairs and other necessary pieces of furniture; but were both only too glad to feel ourselves sleeping again in beds which were stationary, and to know there was no likelihood of being disturbed at intervals by requests to show our tickets, as had been the case for the last seven nights. The remaining few days we spent in seeing everything of possible interest in the neighbourhood, including a salmon 'cannery,' though just then but little work was being done, for the great salmon 'run' does not come until some weeks later, when from each cannery are packed up and sent away thousands of tins of fish, to be distributed all over the world. During the busy season, both Indians and Chinese are in great request, the former being principally employed as fishermen, and the latter boiling and packing up the salmon.

Having come to the end of all our business, we started about seven o'clock one morning on the steamer *William Irving* to make the best of our way to our home. The trip up the river was very lovely, still the same bright clear atmosphere and wonderful freshness in the air which I noticed on the first day of our arrival. A great drawback to the beauty of the scenery, however, were the blackened fir stumps, which stood up in all directions, and showed only too plainly the ravages of many large forest fires. When we reached Langley, a genuine bush settlement, and originally a fort of the Hudson Bay traders, Jack (my husband), Will, and I set off to see if we could find a conveyance to take us up to Alder Grove. After more than one unsuccessful attempt, we were told it was possible we might get a 'buggy' at the minister's, rather farther along the road. So we toiled on, almost grilled, for it was tremendously hot, and were very fortunate in finding Mrs T— at home. She welcomed us kindly and hospitably, but, sad to say, did not think their horse a safe one for strangers to drive over such a bad country. Off the boys started again on another search expedition, this time coming back with better luck, for a lady from Alder Grove was spending the day in Langley, and would be returning almost immediately. She had a tiny baby with her, and a man to drive; but if I would not mind a seat on a box at the back of her 'buckboard,' she would be very pleased. Needless to say I was only too glad to accept her offer; and we were soon ready to start.

No one who has not been over partially cleared roads through a Western forest can have any conception of that drive. Jolt up, jolt down; now the right wheel in mud up to the axle, and

now the left going tilt over a stump a foot high. Every moment I thought I should be thrown off my insecure perch, and had no time to look at what scenery we might be passing through. At last, going down a steep hill, the horse grew so nervous he crouched like a camel, and the whole 'rig' was straining over until I expected to see the shafts snap. Mrs R— began to cry, 'Oh baby, baby!' passed the child to me, and got out instantly, when I handed it to her; and then, in spite of oft-repeated advice about not jumping out of a carriage in danger, I took a good spring, and alighted safely on the ground with no worse damage than yards of torn drapery at my back.

'Oh, Mrs Long,' said Mrs R— reproachfully, 'you would have been all right if you had stayed.'

Perhaps so; but the prospect of sitting behind a plunging horse with a precipice in front and another on the right-hand side hardly seemed to me a sensible idea.

The remaining three miles and a half I did not enjoy much more, as we were mainly occupied in pulling through the great mud-holes, which are often a foot deep and ten feet long, and are caused by the uprooting of enormous tree stumps and roots when the roads are first constructed. Heartily glad was I when we were safely under the shelter of Mrs R—'s hospitable roof, and could comfort ourselves with the thought that no more driving was necessary.

About nine o'clock the next morning we said 'Good-bye' to our hostess, and then set off across a trail to Will's shanty and real bush-life. The trail was such a novel experience, it deserves description. As the roads are at present in a most unfinished condition and few in number, some other communication is necessary between the various settlers' houses; and for this purpose a trail answers admirably. A narrow pathway is trodden out in as direct a line as possible, and the principal large trees notched with an axe—or 'blazed,' as it is called—so that no confusion may arise later on. Often we found it necessary to walk along the huge fallen fir and cedar trunks which lie stretched on the ground in every direction. They are of enormous size, from two to three hundred feet in length, and proportionately broad. Occasionally, we came to a piece of swampy ground, which was made passable by a 'corduroy' bridge, formed of logs laid side by side on the damp earth, and fastened together by cross-pieces, so that in case of high water the bridge can rise or fall like a raft.

Arrived at Will's shanty, we found a little house built of the native cedar of the country, and inside an awful muddle, and chaos reigning, owing to his absence of a fortnight in New Westminster. He showed me some of his land and improvements, and much I sympathised with the difficulties to be met with in clearing land of this description. At noon I was met with a request to prepare dinner as soon as possible; but what to cook and how to cook it, I had not the least idea.

'Bacon and slap-jacks will do well,' said Will; 'and after dinner, I will set some bread.'

So, on a cooking stove, which was standing exposed to the elements at the back of the house, I made my first essay at bush-cookery; and with some assistance and many suggestions, a fairly respectable meal was produced—slap-jacks

proving to be pancakes of flour, water, and baking powder, fried in hot fat. The bachelors, or boys, as all unmarried ranchers are called, are many of them clever cooks and housekeepers, and often I have been able to get hints from them which have proved decidedly useful.

One night we were honoured by a 'chivaree' in our own home, a most doubtful sort of compliment paid to newly-married people on their wedding night. At about eleven o'clock, a procession of young fellows from the different shanties found their way across the trail—anything but an easy matter in the dim light—and came outside the door, calling out and making a great noise. Jack knew what it was directly; and we hastened to let them in and give them whatever provisions we had cooked, with some hot coffee. And after staying two or three hours without making more than half-a-dozen spasmodic remarks apiece, 'they guessed they'd better be quittin',' and returned to their homes to bed. Another pair were less fortunate than ourselves; for, resenting what they considered the impertinence of the intruders, they kept their door shut until three o'clock, when the besieging party broke in, and seating themselves, there and then started to drink some whisky they had with them. The natural consequence was that they were soon in such an uproarious condition that they refused to eat the buns the poor bride had hurriedly baked, declaring them bullets only fit to throw about, and suited the action to the word.

Our house consisted of three good-sized rooms, each of which opened out of the other, so that we were obliged to use the outer one for a kitchen, the middle for a dining-room, and the remaining one as a bedroom. Like nearly all the other shanties, it was made of undressed native cedar planks, taken from the trees by means of a long 'fro,' and built up by the boys themselves. The walls were of course rough and uneven; but, covered with pictures and bric-à-brac, looked pretty and home-like; though the floor defied all efforts to keep it clean by peeling off into long splinters whenever a brush was passed over it. Scrubbing was absolutely out of the question, owing to the porous nature of the wood, which absorbed the water almost like a sponge.

For a fortnight our time was fully occupied in 'packing' our various possessions across the bush. As the house was more than a mile from a road, it necessitated carrying the contents of twenty-three boxes over the trail, anything but an easy or pleasant task. Fortunately, however, no mishaps occurred, in spite of all the difficulties in the way; and we were able to congratulate ourselves on the safe arrival of china and glass with only the breakage of a single tumbler after a journey of six thousand miles.

Having settled our various Lares and Penates, our next care was to make the house 'mosquito-proof,' and to do this it was necessary to cover every hole, crack, and cranny in wall, floor, or ceiling by pasting them over with paper where possible, and by filling in the larger gaps with wads of rag and paper. This process unfortunately took away much from the picturesque effect of the interior, but was the only alternative to being almost consumed by the horrible little pests, which gave us no peace either night or day.

They are certainly one of the drawbacks of colonial life, and do not receive sufficient attention in any pamphlet addressed to 'intending settlers' which I have yet seen. After all our efforts to keep the creatures out, it was certainly mortifying, one evening on going into my room, to find them buzzing about quite cheerily and in large numbers. I at once set to work to kill as many as I could; and after a while, as a matter of interest, thought I would count the number that had penetrated in such a mysterious manner into our stronghold. But after counting two hundred and eleven, and finding apparently as many more buzzing about as when I had begun, I went on killing, regardless of numbers, though I could never discover in what way they came. We converted the bed into a four-poster, and hung it all over with netting, until it resembled nothing so much as a monstrous meat-safe, and by these means only could we get any rest at all.

Our settlement was twenty-five miles from a town, and boasted two stores and a post-office, where the letters were posted and received once a week. Unless, however, one of the settlers killed a sheep or an ox, we had absolutely no fresh meat at all, and even butter and eggs were difficult to obtain. So we were naturally reduced to living on bacon and tinned meats, with whatever our land produced in the way of potatoes and vegetables. A more decided change from the life one lives in England could hardly be imagined, for, naturally, no servants were to be had, as all the families lived on their own ranches, and the girls were needed at home to help either in the house or on the land. So the family wash took the place of tennis, and all other spare time was filled up with blacking stoves, sweeping, dusting, and cooking meals for the boys, all of which duties I could have done more easily if I had but had a little real practical experience of housekeeping before leaving England. Under these circumstances it will be readily imagined that social visits are few and far between, the consequent loneliness proving one of the greatest trials of my ranching experience.

As Alder Grove had no church, a service was held monthly in a large barn-like building called by courtesy the Hall; but whenever it happened to be an 'off-day,' we had to fill up the time to the best of our abilities; and very tedious in consequence were many of the Sundays, when the heat indoors was almost unbearable, and the mosquitoes too fierce to let one think for a minute of sitting down outside.

Our ranch, like all the others in this district, consisted of one hundred and sixty acres of forest-land, with a heavy undergrowth of fir-trees and balsams, which have sprung up since 1835, when a terrific bush-fire spread its ravages far and wide. Thousands of bare and blackened logs lying in all directions bore witness to the fierceness of the flames; while they, together with the numbers which were still standing, added much to the difficulty and labour of clearing this part of the country and rendering it available for farming purposes. After the smaller green timber had been chopped down and burnt—a comparatively easy matter—these great logs or 'stubs' still remained to be disposed of, which was generally done by

sawing them into lengths and piling the fir into great heaps, ready for burning, while the cedar was reserved for fence-rails or any other building purposes. Frequently, during the later summer months, weeks would go by with hardly a glimpse of the sun, the air being filled with smoke from the various ranches, which spread in every direction for many miles.

Although as a rule we were little troubled with seeing wild animals, of which there were many all round us, yet it fell to our lot one night to receive a visit from a skunk. The little creature, not so large as a full-grown rabbit, had discovered a small hole in the side of the kitchen wall, and with its sharp claws had enlarged it sufficiently to make an entrance, after which it set to work to test the quality of our stores. Unfortunately, the kitten imagined she could banish the intruder as she would do a rat, with the painful result that a quantity of the noxious fluid which makes the skunk so disagreeable an animal was squirted over her, and the whole house rendered almost uninhabitable in consequence. But what was to us of far more importance was the fact that the barrel of flour standing in the kitchen was so tainted that we were obliged to throw it away; while the sugar had also suffered, though in a less degree.

LOVE AT THE 'SHIP.'

THERE had been a fog in the early morning, but the sun gathering strength, burst suddenly from behind a black and indigo cloud and streaked the sea with a copperish hue. Then a lamp on the pier flashed like a diamond in a pin, and out popped the tops of the buoys. Far down the beach were two men and a boat. They were stalwart men, and the eldest was busy shaking from the meshes of a draw-net entangled tufts of maroon and brown seaweed. When all the seaweed was shaken out, the net was piled on a barrow and carried to the boat.

'Poor draughts, Shelah,' said the net-shaker, looking philosophically into the basket that held the fish.

'Poor enough, Master Reeks.—Is it home now?'

'Ay, lad, home it is. Get in the boat, Shelah.'

The young man jumped into the boat and took the oars; the other shoved off, and when he was knee-deep in salt water, clambered in after him. The oarsman gave a lusty pull or two, and they were fairly afloat. Reeks lighted his pipe and began meditatively to smoke. The searching brown eyes of his companion were fixed upon the foreshore of Herringbourne. He was watching it over Reeks' shoulder, as it came out bit by bit from the fog. When his gaze altered, it was to look at the sea, where, under the direct rays of the sun, it had become a huge pot of molten silver, overflowing and running towards the shore.

'Shelah,' said Reeks, speaking of a sudden, 'when are you going to marry my Jen?'

There came a little extra colour into Shelah's smooth tanned cheeks, and before he answered he shifted one of the oars from the tholes and wetted the leather. 'I don't know, master,' he said.

'Ah,' said Reeks, with a sigh, 'I wish her mother was alive.'

'Why, old Tom?' asked Shelah.

'Why? To steer her, lad. I'm afeerd my hand is a bit too heavy on the tiller for a dainty craft like my Jen. She wants a woman at her helm—or a husband.'

'What makes you say that?' asked Shelah, resting on his oars.

Tom Reeks deliberately knocked out the ashes of his pipe on the gunnel. 'I'll tell ye, lad,' he said slowly; 'it's been on my mind a long time, an' now I'll tell ye. I don't like the comin's an goin's of that young brewer o' oun, Mr Cyril Rivington.'

Shelah bent his head, and his foot shifted uneasily with the stretcher.

'Now, in my father's time an' in my time the old "Ship" might ha' tumbled about our ears for all the brewer cared or troubled. But since this here young chap ha' come from abroad, an' his father ha' taken him into partnership, things ha' altered. Nigh on every day he's aridin' up to know if we want anything done. Is the beer all right? Are there any repairs needed? An' all that. I shouldn't care how many times he come, Shelah, if it warn't for Jen. I'm afeerd that his fine hoss an' his velvet coat an' his leggins an' his watch-chain may dazzle her, lad. I'm pretty sartin it ain't to see me that he come; an', though I'd lay my life on Jenny's goodness, this young chap ha' got a silvery tongue, an' there's no tellin' what he may whisper in her ears. It's precious little company we see at the "Ship," an' it may make her dissatisfied with the life she's aleadin'.'

'Jen is all right,' said Shelah firmly.

'So she is, my lad; but she'd be a lot better married. It would steady a pretty little craft like my gal wonderfully. It would give her what she wants, Shelah—ballast. An' so, between man an' man, my lad, I want to know when you are agoin' to marry her?'

'I'd marry her to-morrow,' said Shelah wistfully, 'if she'd ha' me, master.'

Reeks looked at him steadily for a moment. 'Shelah Baxter,' he said solemnly, 'you put me in mind of that song the Scotch packman was singin' in the "Ship" the tother night. You sit on a stule an' look like a fule with your hold jaws newly shaven. You ain't got the pluck of a mouse.'

Shelah looked dreamily at the purple-feathered arrows and silvery spear-tipped shafts of cloud over the sea, but gave no contradiction.

'Wi' women, I mean,' pursued Reeks. 'There ain't a man in the whole village, Shelah, that could put you on your back. But wi' women!' He snorted. 'Why, man alive, the bolder you are wi' a woman the better she likes ye. See how they run arter a soger's coat! Now I ha' got a bit, an' you ha' got a boat of your own, an' what's to purvent you two a-settlin' down to-gether?—Pluck up, Shelah, say I; ha' no more shilly-shallyin'.'

'I'll think on it,' said Shelah slowly.

'Do,' said Reeks, refilling his pipe. 'But to act on it would be better.'

Shelah's suspended oars fell splash upon the sea, and for a moment the boat seemed to rise up and fly bodily over the top of a wave, so hard did

he pull. Then he stopped rowing, and drawing the oars towards him through the tholes, he held them with one hand, and began to search his duffels with the other.

'Master,' he said deliberately, 'can you read writin'?'

'No,' said Reeks; 'I can't. Why?'

'Because, if you could, I wanted you to read this.' He held out a sheet of pink note-paper. It was soiled with fish-scales and tobacco dust, but even now retained a sweet and subtle perfume.

Reeks took it gingerly, held it three different ways and narrowly scanned it. 'All I can make out, lad,' he said, 'is these here.'

'What are they?' cried Shelah eagerly.

'Kisses!' said Reeks solemnly—'ten on 'em.'

'Kisses!' repeated Shelah vacantly. In sudden fury he snatched the paper, and doubling it in a ball, threw it far over the waves. Then he bent steadily to the oars. The fog had swept off the land; and beyond the sugary yellow sands and gray sea-stones, stretched the wild desolate denes with their furze and marram grass. In a break between the sandhills there rose up, like a kite with a white tail, the Waister lookout. Lower down, a bending black thread extended across the sky and vanished in the sea. It was the lifeboat warp. On the beach stood the boat itself. Opposite the lookout, Shelah rowed ashore.

'Now,' said Reeks, as he jumped out, 'I'll stow away, lad. Go you up to the "Ship." It's about time you an' Jen came to an onderstandin'. Pluck up, Shelah, an' remember there's allus ways an' means o' winnin' a woman.' He winked and nodded.

Shelah drew his feet out of the wet sand, and with a sad smile moved up the beach. As he strode between the lifeboat and the yawl, his face settled into gloom. There was a big sandhill on his left; he turned aside and mounted it. 'Ten kisses,' he groaned, and looked vacantly around him.

Behind him was Herringbourne; on his right, the German Ocean; on his left, the salt, sandy marshes and fir-hedged dykes of the Waister Road. Below him lay the hammer-shaped village. From here he could just see the swinging sign of the 'Ship'; and with his eyes fixed upon this talisman, he slowly descended the mound and walked towards the inn. The 'Ship's' sign could be seen long before the inn. The house stood back, in the bend of a lane. Within a few paces of the sign Shelah halted. He could hear a horse's hoofs pawing the ground. He was soon regaled with a little whistling, then the softly-hummed verse of a song. The words came to his ears with aggravating clearness:

You've all heard of Larry O'Toole,
Of the beautiful town of Drumgoole;
He had but one eye
To ogle ye by;
Och, murther, but that was a jew'l!
A fool
He made of the girls, this O'Toole.

There next sounded some loud laughter, a step on the tiled path of the inn, then the singer spoke. 'I drink your health, my charmer,' he said, 'in the Rivington brew.' After that he spoke lower, but the words reached Shelah's ears: 'You got my note, Jenny, but you never came. Why was that?'

'I was afraid! And oh, what would father say if he knew that you sent me that note with all those—those?'—The musical voice ended suddenly.

'Kisses, Jenny,' finished the horseman. 'Well, I don't know. I don't particularly care. Love is altogether reckless. And for you, my gipsy, I would risk anything.—Now tell me, Jenny, when can you meet me alone? It is a small favour for a lover to ask. When shall it be?'

Jenny was silent.

'Jenny,' said the rider seriously, 'do you love me?'

Holding his breath, Shelah waited for the answer. It was inaudible.

'Come a little closer, Jenny,' said the horseman gaily; 'kisses on paper are nothing to kisses in'—

'Hush!' cried Jenny; 'some one is coming!'

It was Shelah. He rounded the corner in time to see Mr Cyril Rivington riding away.

With his head bowed, Shelah crossed the threshold of the inn door. He was met inside by a pretty brown-cheeked girl, whose face had a heightened and rather unusual bloom. At the sight of Shelah she looked disconcerted. His requirements were so well known that they needed no inquiry, and presently she set before him a pint mug. Shelah slid it on one side.

'Jen, lass,' he said, 'I want to speak to you; I want to ask you somethin'.'

Jenny started, and there was a sensible diminution of the colour in her cheeks. 'Not now, Shelah,' she said nervously; 'I'm busy just now. Wait till father comes in.'

'No,' said Shelah; 'I can't wait. If I don't speak now, I shall never speak. I won't stop you long.'

'Well then,' said Jenny, 'say it quick. What is it?' She seated herself with her face to the window and her foot nervously tapping the sanded floor.

'It's this,' said Shelah, and his voice shook a little; 'we ha' been sweetheartin' for a long time, and I want to know when we are going to get married, Jen?'

'Never,' she said softly.

'Never,' he repeated huskily.

'I should only make you wretched. I want you to give me up, to forget me, Shelah.'

'Give you up, Jen! Give you up, lass! Give up my life—ask me for that, Jen, but don't ask me to give you up, sweetheart, for I do so love you, my dear.'

Jenny's lips quivered, and her eyes began to fill with tears, but she still kept her face to the window. 'It would break my heart to marry you,' she said, 'for I love some one else.'

'You love some one else,' said Shelah mechanically.

'Yes; and he is going to marry me. So you see, Shelah, it would be wrong for me to marry you. I should be always miserable and wretched, and I should make you miserable and wretched too; so please, dear Shelah, let me go, and—forget me.' She ended with a sob.

White and still sat Shelah; then heavily and wearily he rose. Jenny uncovered her face for a moment. At the sight of his she hid it again. 'Forget you, lass,' he said, 'I never can.' He looked at her wistfully, as if he was committing

to heart every little ringlet of her hair. Moved, perhaps, by the thought of what might have been, he leant down and gently pressed his lips to her forehead. 'But if giving you up, lass,' he proceeded huskily, 'will make you happy, why, Jen'—there was an agonising ring in his voice—'why, I give you up.'

She heard his heavy, slouching steps moving towards the door. When she looked round again, he was gone.

All that night it froze hard, and the calm sea lay moaning like a dog on its chain. Shelah heard it as he stood in the lonely sentry-box of the lifeboat lookout. In the morning, the frost-bowed blades of the sea-grass had changed the denes into a great glistening bed of white coral. As usual, Shelah called at the 'Ship' for Tom Reeks. He had barely entered when he heard a horse's hoofs on the hard road. A horseman reined up at the inn, and Shelah drew back into the shadow. 'Shelah!' It was Jenny who spoke. She stood white and trembling on the cellar steps. 'Will—will you take him this?'

Strangely fascinated at being called upon for such an act, Shelah took from her the measure of sparkling ale, and, like a man in a dream, carried it to the door. With his head down he walked up to the rider. A loud 'Hem!' caused him to start and look up. Instead of the young brewer, he was facing the old one. The elder Rivington looked at the ale as a doctor might look at his own medicine. 'No, my man,' he said; 'I don't care for anything so early as this. If you'll have the goodness to hold my horse, while I dismount. Thank 'ee. Tether him there, will you? I want to see the landlord; is he in?'

Before Shelah could answer, Reeks gave evidence of his bodily presence by appearing at the doorway. The brewer walked in, followed by Shelah. Rivington, senior, was a pleasant, chatty old gentleman, and he soon disclosed the object of his visit. A ball was going to be held at Herringbourne Town Hall, and he was distributing invitations to such of his tenants as chose to attend. As he was passing—quite by accident, he assured them—he felt he ought not to miss the landlord of the 'Ship.' There were the tickets, and he hoped that Reeks and his daughter would attend.

'I forgot to mention,' he said blandly, as Reeks, after expressing his thanks, took them up, 'that this ball is to be held in honour of my son Cyril's marriage. He is to be married this week to the daughter of a very old friend of mine—a man of Kent.'

As he finished, a low sobbing cry startled all but Shelah. A beer-warmer had rattled to the floor, and Jenny stood vacantly staring into a little lake of the spilt liquid at her feet.

'Why, what's the matter, lass?' said Reeks; 'you look as white as a ghost.'

'Nothing, father,' she answered faintly—'nothing; only the heat of the fire.'

'That is what it was,' said old Rivington; 'the heat of the fire, no doubt. I have experienced the same sensation myself.—Well, good-day, Reeks; I hope you'll find it convenient to attend.'

He nodded pleasantly, untethered his horse from the palings, and mounted it. As he rode away he smiled softly, and patted his horse's

mane. When horse and rider had passed the green fir-trees on the road, Shelah Baxter came out of the 'Ship' and walked aimlessly down to his boat. The surf was boiling on the Scroby, and great rollers with foaming crests were racing in, and tumbling upon the sun-lighted beach. He stood awhile absently watching the little salt fountains which their recoil left bubbling in the sand, then mounted the tall hillock to look for Reeks. On the top he started, and his tanned cheeks grew pale. At the base of the mound by a dwarfed clump of furze sat a girl, sobbing violently. It was Jenny Reeks. He descended the side she was on and gently touched her shoulder. 'You'll catch cold, lass,' he said sadly, 'if you set here.'

Through her tear-brimmed eyes she looked into his face. Not a word of reproach. Only in his eyes was the love that had been so constant and true. With a little catching of her breath, Jenny rose and drew back; then, with a convulsive cry, she flung her arms wildly round his neck, and there she sobbed till she could sob no more. When they went back to the 'Ship,' Reeks met them at the door. Something in their attitude made him softly whistle. A nearer view of their faces made him chuckle. It seemed as if Shelah had taken his advice, and plucked up at last!

AUSTRALIA'S FIRST FLEET.

THE arrangement whereby Australia has become possessed of a navy is the first of its kind recorded in history. It is hard to say whether commercial keenness or martial ambition is the leading feature of the transaction. Australia, like other places, suffers from war scares. Russia and China take turn about at playing bogie man, and at these times affrighted colonists turn their eyes wistfully to the blue Pacific. A couple of fast cruisers could pillage the capitals in a day and a night. Yet, as scare after scare subsided, there was nothing done. A hazy idea of England's protecting presence survived. It was readily enough felt that an attack upon Australia would be made only when England would be herself at war, and that, as a consequence, the amount of protection available would be a risky quantity. Still, where was a way out?

To build and maintain a fleet was too expensive. To go on as a dependent upon the arms of England was beneath the dignity of a country of large ambitions. Under this latter aspect leading colonists were in the habit of conjuring up visions of the toilworn, poverty-stricken people of Britain paying taxes to support a British squadron in Australian waters for the protection of the interests of comparatively opulent cities; this was the point around which the late Sir Alexander Stuart and Mr Dalley constructed Imperialistic theories. They desired Australia to pay for the use of the British squadron. The opposing theory was that Australia should obtain on terms a fleet of her own.

After many years of discussion and some very close bargaining, this latter theory has been reduced to fact, and a fleet of seven warships are now moored in the waters of Port Jackson.

The terms redound to the credit of the com-

mercial aptitude of the colonies. The Admiralty spent over nine hundred thousand pounds on building and equipment. The colonies had agreed to pay five per cent. per annum on the initial outlay, but set the limit at an estimate of seven hundred thousand pounds. As is usual with estimates, the actual cost turned out almost a third more, so that Australia receives the advantage of an extra two hundred thousand pounds without having to pay any interest. There was a general understanding that the cost of manning and maintenance would be borne wholly by the colonies. In the signed agreement this understanding is reserved. It is there provided that in time of emergency or actual war the cost of commissioning three of the vessels shall be borne by Great Britain. Australia's contribution to the Admiralty will be thirty-five thousand pounds a year for ten years, at the end of which time the Admiralty may take the vessels back. As, at the present rate of scientific progress, the ships of war of 1901 will be in all likelihood very different from what they are to-day, the provision returning the fleet to the Admiralty is cheerfully acquiesced in by the colonies.

Throughout the negotiations, the Admiralty showed a disposition to give the colonies everything they wanted. When monetary matters were determined, the naming of the ships came up. The Admiralty proposed to call one the *Pandora*. The colonies objected, and at their suggestion she was called the *Katoomba*. Similarly, the Admiralty-given names of *Peloris*, *Persian*, *Phoenix*, *Wizard*, and *Whiting* were changed to *Mildura*, *Wallaroo*, *Tauranga*, *Karralatta*, and *Boomerang*. All these are the native names of Australian places, or of articles and implements known to the aborigines.

Thus has Australia possessed herself of a necessary part of her national outfit. It is the first instance on record of a colony and a parent country entering upon an alliance in such terms.

BROKEN.

WILL it ever come back, the old sweet thought,
That never a whisper of sorrow brought?
The old dear love that no cloud could dim?
The tender warmth of a fire within?
The light from no sun or earth lamp lent?
The music born of no instrument?
Will it ever come back the dear lost thing?
Can nobody patch up this broken string?

There are chords once broken no hand can mend;
Strong chords that snap where they cannot bend.
We may patch the rent with our heart's last creed;
'Twill answer no longer our spirits' need;
No longer vibrate as at love's own touch,
Love answering love with a swift glad rush
Of joy, that no fate could spoil or crush.
Yet a word may break what not death could sever,
And trust once broken is broken for ever.

HISTORY REPEATS ITSELF.

IF History, specially so called—the lives of kings and queens, of governors and warriors and statesmen—repeats itself, as he who runs may read that it does, how much more, in the story of their lives from year to year, does the history of those about us repeat itself generation after generation. It is not the exclusive appanage of a royal race to be unfortunate; characteristics fraught with ill appear and reappear in families, and are not confined to the highest or, indeed, to any particular stratum of society.

Bonaparte's fatalism, which led him again and again, on his disastrous march on Moscow, to point out to his attendants as 'the sun of Austerlitz' the very rays that were lighting him to his destruction—that fatalism reappeared in his nephew, and led him as surely to Sedan; just as Jones's 'ill-luck,' as he calls it, clings to Jones's son; and in both cases, it is not unfair to suppose that it is the family characteristic that causes their history to repeat itself. Buckingham, on his way to execution, speaking of his father's death on the scaffold, says, 'We are one in fortunes,' as though it ran in the family of the Bohuns to suffer, and in that of the Tudors to condemn to execution as a necessary complement.

Disappointments of the heart 'ran' in Colonel Newcome's family; and when he sees Clive suffering the same pangs of disprized love which he himself had overlived, he tries to console his son by saying it is their fate; but the reader of *The Newcomes* may fairly conclude that a similarity of character has had at least as much share as fate in bringing about the repetition.

An ingenious speculative philosopher once promulgated the theory, that as myriads of planets have been continually going through processes of development similar to our own, so there rolls at this moment through space an orb in all likelihood synchronous with our own; and that, given the same component parts and the same laws ruling them, the results must

be not merely similar but identical. So this postulated sphere has passed through its various periods, glacial, &c.; has produced its Homer and its Shakespeare, its Bacon and its Scott, 'yea, all which we inherit.' This is to make history repeat itself indeed; but unless we should learn some day to interpret the twinkling of the stars—supposed, by another learned Theban, to be attempts to communicate with us by a code of signalling not as yet understood by our scientific electricians—we must for the present remain content to observe the repetitions in our own 'particular star;' to note that even yet there are people so little willing to be guided by what has already happened, so loth to believe that in their lives history will repeat itself, that they will buy their knowledge of life at famine price, rather than trust to the teachings of experience.

To give an instance of this. All agree in the truth of the axiom that high interest is another name for bad security. Does this prevent bubble schemes, airy companies, from puffing their impossible proposals? By no means. Half mankind forget what the other half never knew; and thus, like children, men are still the dupes of to-morrow, every day beguiled by expectation. And so in all ages men and women have clung to omens, portents, and vaticination for the unravelling of their future fortunes, rather than to look calmly into the past, to frame thence a probable conjecture which time may turn into a prophecy.

Beside this incapacity to profit by experience, there is ingrained in human nature a feeling of the vicissitude of things, as apparent to-day as a thousand years ago. Anything however distantly resembling a vaunt is instinctively avoided. Acknowledging good health, for example, a man will add, 'But I mustn't boast,' as though conscious of some power—like the ancient Nemesis—lurking in the background to avenge the boast. Not to awaken envy—the real Nemesis, perhaps, of the fortunate—the wise man will ascribe his success in life to fortune rather than to himself, and so disarm and baffle

the usual vicissitudes of existence. But so difficult is this of accomplishment, that Disraeli's paradox, that it is only the unforeseen, or, as one version has it, the impossible, that is sure to happen, meets with universal approbation.

Still men gather together, like the Athenians of old, to hear and to tell some new thing, even while they repeat the proverb, that there is nothing new under the sun, and that all knowledge is but remembrance.

Century after century, as we regard things attentively, we perceive to be guided by what has been called the Spirit of the Age—a Protean spirit, as powerful to-day as when, through the preaching of Peter the Hermit, it stirred up the population of these Isles to go crusading to the arid plains of Palestine; or, entering the brain of Cervantes, taught mankind to mock at chivalry. Now, the spirit of the age reproves the people into Puritanism; anon the same spirit gives the cue to make motley our only wear, and is constant only in this, to be 'to one thing constant never.' If an Act of Parliament has been passed in conformity with the spirit of a past age, the strongest argument for its repeal is its unsuitability to the requirements of the age in which we live. In short, be the case what it may, a hospital's management, a charity's abuse, a monument's erection, a law's enactment, a million to be spent or a million to be saved, an invention to be boldly tried or rashly rejected, let but the patron succeed in proving it to be worthy, or the critic expose its unworthiness of this same eternal spirit, and half his work is done. But until a decade or so has passed, we see and hear and feel the spirit ruling our own age, but we cannot name him. Whether ours will be characterised as an age of education, of over-pressure, of materialism, of hypnotism—which is only mesmerism revived—a mechanical age, a philanthropic age, or a literary age—none of us who live in it can tell. The Americans, we observe, speak of the 'drift of the age' being scientific, so it may obtain its name from the famous Professors which it has certainly produced. But whatever title it obtains, we may be sure that its echo will be found somewhere in history.

In conclusion, we would call the attention of the observer of every-day life to a something outside the ordinary repetitions to which we have alluded. More things are hereditary in families than corns or cancer or consumption. Glass eyes are not on the face of them likely to be an inheritance, and yet, by a strange and unlooked-for accident, or string of accidents rather, we have known them in three generations of the same family. Again, a lady losing her hand by the sudden breaking of a window-cord precipitating the sash on to the limb, does not seem an accident likely of recurrence, and yet, twenty years after the accident, the lady's daughter lost her hand in a precisely similar manner. In these cases it would seem that there was a fate in the family to be reckoned with, beyond the repetitions and resemblances which have made and justified the proverb, 'Like father, like son'—a something resembling that Fate

whose scales Jove himself could only adjust, not turn; which gives a colour to the assertion that this man is born with a silver spoon in his mouth, and that one with a wooden ladle, and to the confident but ominous prediction, that he that is born to be hanged can never be drowned.

THE IVORY GATE.*

By WALTER BESANT.

CHAPTER XII.—A MYSTERIOUS DISCOVERY.

'EVERYTHING is here, and in proper order.' He laid his hand upon the papers. 'Here, for instance, is the first letter, dated February 14th, relating to these transactions.—You will no doubt remember it, Mr Dering.' He took up a letter, and read it aloud. "MY DEAR ELLIS—I enclose a bundle of certificates and shares. They amount to somewhere about £6500 at current price. Will you have these transferred to the name of Edmund Gray, gentleman, of 22 South Square, Gray's Inn? Mr Edmund Gray is a client, and I will have the amount paid to my account by him. Send me, therefore, the transfer papers and the account showing the amount due to me by him together with your commission.—Very sincerely yours, EDWARD DERING." That is the letter. The proceeding is not usual, yet not irregular. If, for instance, we had been instructed to buy stock for Mr Dering— But of course you know.'

'Pardon me,' said George. 'I am not so much accustomed to buy stock as my partner. Will you go on?'

'We should have done so, and sent our client the bill for the amount with our commission. If we had been instructed to sell, we should have paid in to Mr Dering's Bank the amount realised less our commission. A transfer is another kind of work. Mr Dering transferred this stock to Edmund Gray, his client. It was therefore for him to settle with his client the charges for the transfer and the value of the stock. We therefore sent a bill for these charges. It was sent by hand, and a cheque was received by return of the messenger.'

George received the letter from him, examined it, and laid it before his partner.

Mr Dering read the letter, held it to the light, examined it very carefully, and then tossed it to Checkley.

'If anybody knows my handwriting,' he said, 'it ought to be you. Whose writing is that?'

'It looks like yours. But there is a trembling in the letters. It is not so firm as the most of your work. I should call it yours; but I see by your face that it is not.'

'No; it is not my writing. I did not write that letter. This is the first I have heard of the contents of that letter.—Look at the signature, Checkley. Two dots are wanting after the word Dering, and the flourish after the last "n" is curtailed of half its usual dimensions. Did you ever know me to alter my signature by a single curve?'

'Never,' Checkley replied. 'Two dots want—'

* Copyright 1892 in the United States of America by Harper & Brothers.

ing and half a flourish.—Go on, sir; I've just thought of something. But go on.'

'You don't mean to say that this letter is a forgery?' asked Mr Ellis. 'Why—then—Oh! it is impossible. It must then be the beginning of a whole series of forgeries. It's quite impossible to credit it. The letter came from this office: the postmark shows it was posted in this district: the answer was sent here. The transfers—consider—the transfers were posted to this office. They came back duly signed and witnessed—from this office. I forwarded the certificate made out in the name of Edmund Gray—to this office: and I got an acknowledgment—from this office. I sent the account of the transaction with my commission charges—to this office, and got a cheque for the latter—from this office. How can such a complicated business as this—only the first of these transactions—be a forgery? Why, you want a dozen confederates at least for such a job as this.'

'I do not quite understand yet,' said George, inexperienced in the transfer of stocks and shares.

'Well, I cannot sell stock without the owner's authority; he must sign a transfer. But if I receive a commission from a lawyer to transfer his stock to a client, it is not my business to ask whether he receives the money or not.'

'Yes—yes.—And is there nothing to show for the sale of this £6000 worth of paper?' George asked Mr Dering.

'Nothing at all. The letters and everything are a forgery.'

'And you, Mr Ellis, received a cheque for your commission?'

'Certainly.'

'Get me the old cheques and the cheque book,' said Mr Dering. The cheque was drawn, as the letter was written, in Mr Dering's handwriting, but with the slight difference he had pointed out in the signature.

'You are quite sure,' asked George, 'that you did not sign that cheque?'

'I am perfectly certain that I did not.'

'Then as for this Edmund Gray of 22 South Square, Gray's Inn—what do you know about him?'

'Nothing at all—absolutely nothing.'

'I know something,' said Checkley. 'But go on—go on.'

'He may be a non-existent person, for what you know.'

'Certainly. I know nothing about any Edmund Gray.'

'Wait a bit,' murmured Checkley.

'Well, but'—Mr Ellis went on—'this was only a beginning. In March you wrote to me again; that is to say I received a letter purporting to be from you. In this letter—here it is—you instructed me to transfer certain stock—the papers of which you enclosed—amounting to about £12,000—to Edmund Gray aforesaid. In the same way as before the transfer papers were sent to you for signature: in the same way as before they were signed and returned: and in the same way as before the commission was charged to you and paid by you. It was exactly the same transaction as before—only for double the sum involved in the February business.'

Mr Dering took the second letter and looked at it with a kind of patient resignation. 'I know nothing about it,' he said—'nothing at all.'

'There was a third and last transaction,' said the broker. 'This time in April. Here is the letter written by you with instructions exactly the same as in the previous cases, but dealing with stock to the amount of £19,000, which we duly carried out, and for which we received your cheque—for commission.'

'Every one of these letters—every signature of mine to transfer-papers and to cheques—was a forgery,' said Mr Dering slowly. 'I have no client named Edmund Gray: I know no one of the name: I never received any money from the transfers: these investments are stolen.'

'Let me look at the letters again,' said George. He examined them carefully, comparing them with each other. 'They are so wonderfully forged that they would deceive the most careful. I should not hesitate, myself, to swear to the handwriting.'

It has already been explained that Mr Dering's handwriting was of a kind which is not uncommon with those who write a great deal. The unimportant words were conveyed by a curve, with or without a tail, while the really important words were clearly written. The signature, however, was large, distinct, and florid—the signature of the House, which had been flourishing for a hundred years and more, a signature which had never varied.

'Look at it,' said George again. 'Who would not swear to this writing?'

'I would for one,' said Mr Ellis. 'And I have known it for forty years and more.—If that is not your own writing, Dering, it is the very finest imitation ever made.'

'I don't think my memory can be quite gone.—Checkley, have we ever had a client named Edmund Gray?'

'No—never. But you've forgotten one thing. That forgery eight years ago—the cheque of £720—was payable to the order of Edmund Gray.'

'Ah! So it was. This seems important.'

'Most important,' said George. 'The forger could not possibly by accident choose the same name. This cannot be coincidence. Have you the forged cheque?'

'I have always kept it,' Mr Dering replied, 'on the chance of using it to prove the crime and convict the criminal.—You will find it, Checkley, in the right-hand drawer of the safe.—Thank you. Here it is. "Pay to the order of Edmund Gray;" and here is his endorsement. So we have his handwriting at any rate.'

George took it. 'Strange,' he said. 'I should without any hesitation swear to your handwriting here as well. And look—the signature to the cheque is exactly the same as that of these letters. The two dots missing after the name, and the flourish after the last "n" curtailed.'

It was so. The handwriting of the cheque and of the letters was the same: the signatures were slightly, but systematically, altered in exactly the same way in both letters and cheque.

'This again,' said George, 'can hardly be coincidence. It seems to me that the man who wrote that cheque also wrote those letters.'

The endorsement was in a hand which might

also be taken for Mr Dering's own. Nothing to be got out of the endorsement.

'But about the transfer papers,' said George. 'They would have to be witnessed as well as signed.'

'They were witnessed,' said the broker, 'by a clerk named Lorry.'

'Yes, we have such a man in our office.—Checkley, send for Lorry.'

Lorry was a clerk employed in Mr Dering's outer office. Being interrogated, he said that he had no recollection of witnessing a signature for a transfer paper. He had witnessed many signatures, but was not informed what the papers were. Asked if he remembered especially witnessing any signature in February, March, or April, he replied that he could not remember any, but that he had witnessed a great many signatures: that sometimes Mr Dering wanted him to witness his own signature, sometimes those of clients. If he were shown his signature he might remember. Lorry, therefore, was allowed to depart to his own place.

'There can be no longer any doubt,' said George, 'that an attempt has been made at a robbery on a very large scale.'

'An attempt only?' Mr Dering asked. 'Where are my certificates?'

'I say attempt, because you can't really steal stock. Dividends are only paid to those who lawfully possess it. This Edmund Gray we can find, if he exists. I take it, however, that he does not. It is probably a name assumed by the forger. And I suppose that he has made haste to sell his stock. Whether or no, you will certainly recover your property. People may as well steal a field as steal stocks and shares.'

'We can easily find out for you,' said Mr Ellis, 'what has become of your paper.'

'If the thieves have kept it,' George went on, 'all they could make would be the dividends for five months. That, however, is only because the Bank book was not examined for so long. They could not reckon upon such an unusual stroke of luck. It seems almost certain that they must get rid of the stock as quickly as they could. Suppose that they have realised the whole amount. It is an immense sum of money. It would have to be paid by cheque into a bank: the holder could only draw out the money gradually: he might, to be sure, go to America and have the whole amount transferred, but that would not help him much unless he could draw it out in small sums payable to confederates. In fact, the robbery seems to me hedged about with difficulties almost impossible.'

'It is the most extraordinary attempt at robbery that ever was,' said Mr Ellis. 'Thirty-eight thousand pounds in shares. Well, I will find out for you if they have been sold and to whom. Meantime, my old friend, don't you be down-hearted about it. As Mr Austin says, you will certainly get your property back again. What? We live in a civilised country. We cannot have large sums like £40,000 stolen bodily. Property isn't kept any longer in bags of gold. Bank-notes, banks, investments, all tend to make great robberies impossible.—Courage; you will get back your property.'

Mr Dering shook his head doubtfully.

'There is another chance,' George suggested. 'One has heard of robberies effected with the view of blackmail afterwards. Suppose we were to get a letter offering the whole to be returned for a certain sum.'

'No—no. It is now four months since the thing was done. They have sold out the stock and disappeared—gone to America, as you suggested. Why, the things may have been sold a dozen times over in the interval. That is the danger. Suppose they *have* been sold a dozen times over. Consider. Here is a share in the Great Western. I transfer it from A to B. Very good. The share now belongs to B, and stands in the name whether honestly come by or not. B sends it to another broker, who sells it to C. He, again, to D. Every transaction is right and in form except the first. You can trace the share from owner to owner. B has vanished. A says to C: "You bought that share of a thief." C says: "Very sorry. How was I to know? D has got it now." D says that it is his, and he will stick to it. We go to law about the share. What is going to happen? Upon my word, I don't know.—Well—but this is only conjecture. Let me first find out what has become of the shares. Of course there is a record, I have only to refer. I will let you know by to-morrow morning, if I can.'

When Mr Ellis was gone, George began to sum up, for the clearing of his own mind, the ascertained facts of the case, so far as they had got.

'First,' he said, 'the letters to Ellis and Northcote were written on our headed paper. Clearly, therefore, the writer must have had access to the office. Next, he knew and could copy your handwriting. Third, he was able to intercept the delivery of letters, and to prevent your getting any he wished to stop, because the correspondence was conducted openly through the post. That seems to be a very important point. Fourth, the letters were all, apparently, in your handwriting, very skilfully imitated, instead of being dictated and then signed. Fifth, he must at least have known of the last forgery, or how did he arrive at the name of Edmund Gray? And was it out of devilry and mockery because that forgery escaped detection, that he used the name again? Sixth, he must have had access to the safe where the cheque book (as well as the certificates) was kept. Seventh, he must have known the office pretty well, or how did he find out the names of your broker? Eighth, the handwriting appeared to be exactly the same as that of the former forgery.'

'It is the same as last time,' said Checkley. 'That forgery was done in the office, if ever a thing was done here. Same with this—same with this. Well—time will show. Same with this.' He glared from under his great eyebrows at the young partner, as if he suspected that the young gentleman could throw some light upon that mystery if he wished.

'We have given Time long enough to discover the author of the last business,' said Mr Dering; 'but he has not chosen to do so as yet. The loss of property,' he groaned—'the loss of close on forty thousand pounds.'

'I don't believe it is lost,' said George. 'It can't be lost. It is a bit of a railway—part of a reservoir—a corner of the gas-works—you can't

lose these things—unless, indeed, the difficulty suggested by Mr Ellis occurs.

Here Mr Dering pushed back his chair and began again to walk about the room in restless agitation. He was no longer the grave and serious lawyer; he became one of his own clients, lamenting, as they had so often lamented in that room, the greatness of his misfortune. He uttered the actual commonplaces of men in distress—there is a dreadful sameness about the Lamentation of Ill Luck. We all know them—the hardness of the thing: the injustice of it: the impossibility of warding it off: his own sagacity in taking every precaution: the dreadfulness of being singled out of a whole generation for exceptional misfortune. Mr Dering himself, the grave, calm, reserved, old lawyer, who seemed made of granite, broke down under the blow and became an ordinary human creature. In the lower walks, they weep. Checkley would have wept. Mr Dering became eloquent, wrathful, sarcastic. No retired General who has ruined himself by gambling in stocks could so bemoan his luck. George listened, saying nothing. It was an experience. No man so strong but has his weak point. No man is completely armoured against the arrows of fate.

Presently he grew a little more calm and sat down. 'Forgive me, George,' he said gently—'forgive this outbreak. There is more in the business than you know of. I feel as if I know something about it, but can't bring it out. I am growing so forgetful—I forget whole days—I am filled with the feeling that I ought to know about it. As for the loss, what I have said is true. You do not yet feel as I do about Property. You are too young: you have not got any Property yet. Wait a few years—then you will be able to agree with me that there is nothing in the world so hard as to lose your property—the property that you have made—by your own exertions—for yourself.'

'Now you talk like yourself,' said Checkley. 'That's sense. Nothing so dreadful as to lose property. It's enough to kill people. It has killed many people.'

'Property means everything. You understand that the more the older you get.'

'You do,' said Checkley. 'There's nothing in the world worth considering except property.'

'It means—remember—all the virtues—prudence—courage—quick sight—self-restraint, tenacity, all the fighting qualities. We do well to honour rich men. I hoped to receive honour myself as a rich man. When you have put together a few thousands—by the exercise of these finer qualities, so that the thought of this gives you dignity.'

'Ah!' cried Checkley, straightening himself.

'To feel that they are gone—gone—gone—it is cruel.—George, you don't understand it. You are young: as yet you have no money.—Checkley, you have saved'

'A trifle, a trifle.' But he covered his mouth with his hand to conceal the smile of satisfaction.

'You are reputed rich.'

'No—no—no. Not rich. My chances have been few. I have not let them go. But rich? No—no.'

'How would you regard the loss—the robbery of your property—Checkley?'

The old clerk shook his head. He had no words adequate to the question.

'Apart from the loss,' Mr Dering went on, 'there is the sense of insecurity. I felt it once before when the other forgery took place. There seems no safety anywhere. Papers that I keep in my private safe, to which no one has a key but myself, which I never leave open if I leave the room even to go into another room, are taken. Cheque books which I keep there are taken out and cheques stolen. Finally, things are put in—the bundle of notes—for instance. I say that I feel a sense of helplessness, as if everything might be taken from me, and I should be powerless to resist.'

'Let us first get back the certificates,' said George, 'and we will find out and defeat this gang, if it is a gang, of confederates. Yes—it is as you say—the ground itself seems sinking beneath one's feet—when one's own investments are sold for nothing by a letter so like your own writing that it would deceive anybody.'

'Done in the office,' Checkley murmured—'in the office. Same as last time. Well—we shall find him—we shall find him.' He began to bundle the papers back into the safe, murmuring: 'Same as last time—done in the office—we shall find him—we shall find him. We found him before, and we'll find him now.'

CHAPTER XIII.—THE FIRST FIND.

'Yes,' said George, thoughtfully, 'a day or two ought to unravel this matter. We must first, however, before going to the Police, find out as much as we can ourselves. Let me take up the case by myself for a bit.'

'No—no,' Checkley grumbled. 'Police first. Catch the man first.'

'Put aside everything,' said the Chief, 'everything, George. Forget everything until you have found out the mystery of the conspiracy.'

'It looks to me like a Long Firm,' George went on—'a Long Firm with a sham name and a respectable address. Of course there is no such person, really, as Edmund Gray.'

'It is not only the loss—perhaps, let us hope'—Mr Dering sighed—'only a temporary loss; if a real loss, then a most terrible blow—not only that, but it is the sense of insecurity. No one ever found out about that cheque—and here are the notes in the safe all the time.'

'He put 'em in,' said Checkley.

'This is the second time—and the same name still—Edmund Gray. It fills me with uneasiness—I am terrified, George. I know not what may be the next blow—what may be taken from me—my mortgages—my houses—my land—everything. Go. I can do the work of the office—all the work—by myself. But this work I cannot do. I am not able to think about it. These thoughts overpower me and cloud my reason.'

'Well,' said George, 'I will do what I can. I don't suppose there is any Edmund Gray at all: but one must try to find out. There can be no harm in paying a visit to Gray's Inn. If the thing had been done yesterday, it would be necessary to strike at once with a warrant for the arrest of the said Edmund Gray. As it is four months since the last robbery, there

can be small harm in the delay of a day or two. I will go and inquire a little.'

Nothing easier than to inquire. There was the man's address: everybody knows Gray's Inn: everybody knows South Square. The place is only ten minutes' walk from Lincoln's Inn. George took his hat, walked over and proceeded straight to No. 22, expecting to find no such name on the door-posts. On the contrary, there it was. '2d Floor, Mr Edmund Gray,' among the other occupants of the staircase. He mounted the stairs. On the second floor right was the name over the door, Mr Edmund Gray. But the outer door was closed. That is a sign that the tenant of the Chambers is either not at home or not visible. On the first floor were the offices of a Firm of Solicitors. He sent in his card. The name of Dering & Son commands the respectful attention of every solicitor in London. One of the partners received him. The firm of Dering & Son was anxious to see Mr Edmund Gray, who had the Chambers overhead. At what hours was Mr Edmund Gray generally in his rooms? Nobody knew: not either of the partners, not any of the clerks. He might have been met going up and down the stairs, but nobody knew him by sight, or anything about him. This, at first sight, seemed suspicious; afterwards George reflected that men may live for years on the same staircase and never know anything about each other. Men who live in Gray's Inn do not visit each other: there is little neighbourly spirit among men in Chambers, but rather an unspoken distrust.

'But,' said the partner, 'I can tell you who is his landlord. He does not take the rooms of the Inn direct, but as we do, from one who has several sets on a long lease, and sublets the rooms. They may know something about the man at the Steward's office across the Square. If not, the landlord will certainly know.'

George asked if Edmund Gray was newly arrived. No. It appeared that he had been in the Inn for a long time. 'But then,' his informant added, 'he may have been here a hundred years for all we know: we never think of our neighbours in Chambers. Opposite is a man whose name has been over the door as long as I can remember anything. I don't know who he is or what is his business. I don't even know him by sight. So with Mr Edmund Gray. If I were to meet him on the stairs, I should not be any the wiser. You see I am only here in the daytime. Now, the other man on the second floor I do know something about, because he is a coach and was a Fellow of my College. And the man in the garrets I hear about occasionally because he is an old barrister who sometimes defends a prisoner.'

At the Steward's office George put the same question. 'I am a solicitor,' he said. 'Here is my card. I am most anxious to see Mr Edmund Gray of No. 22. Could you save me time by letting me know at what hour he is in his Chambers?'

They could tell him nothing. Mr Gray was not a tenant of the Inn. Very likely he was a residential tenant who came home in the evenings after business.

Everything learned is a step gained. Whether Edmund Gray was a man or a Long Firm, the

name had been on the door for many years. But—many years?—could a confederacy of swindlers go on for many years, especially if they undertook such mighty schemes for plunder as this business?

Next, he went to the address of the landlord. He was a house agent in Bloomsbury, and apparently a person of respectability.

'If you could tell me,' George began with the same question, 'at what hours I could find your tenant in his Chambers; or if you could give me his business address, we should be very greatly obliged. We want to find him at once—to-day—if possible, on very important business.'

'Well, I am sorry, very sorry—but—in fact, I don't know anything about my tenant's hours, nor can I give you his place of business. I believe he has no business.'

'Oh! But you took him as a tenant. You must have had some references.'

'Certainly. And upon that I can satisfy you, very shortly.' He opened a great book and turned over the pages. 'Here it is—to No. 22, South Square, Gray's Inn, Second floor, north side—Edmund Gray, gentleman. Rent £40 a year. Date of taking the rooms, February 1882, at the half-quarter. Reference, Messrs Dering & Son, Solicitors, New Square, Lincoln's Inn.'

'Why—you mean that he referred to us—to Messrs Dering & Son—in the year 1882!'

'That is so. Would you like to see the letter which we received on application? Wait a moment.' He rang the bell, and a clerk appeared, to whom he gave instructions. 'I am bound to say,' the landlord went on, 'that a more satisfactory tenant than Mr Gray does not exist. He pays his rent regularly by Post-office order every quarter on the day before quarter-day.'

'Oh! I wonder'—But he stopped, because to begin wondering is always futile, especially at so early a stage. When there are already accumulated facts to go upon, and not till then, wondering becomes the putting together of the puzzle.

'Well, here is the letter. "Gentlemen"—the house agent read the letter received on application to the reference—"In reply to your letter of the 13th, we beg to inform you that Mr Edmund Gray is a client of ours, a gentleman of independent means, and that he is quite able to pay any reasonable rent for residence or Chambers.—Your obedient servants, DERING & SON."—I suppose,' he added, 'that a man doesn't want a better reference than your own?'

'No; certainly not.' George looked at the letter. It presented as to handwriting exactly the same points of likeness and of difference as all the other letters in this strange case: the body of the letter apparently written in the hand of Mr Dering; that is, so as to deceive everybody: the signature with one or two small omissions. 'Certainly not,' he repeated. 'With such a reference, of course you did not hesitate. Did you ever see Mr Gray?'

'Certainly. I have seen him often. First, when he was getting his rooms furnished, and afterwards on various occasions.'

'What kind of a man is he, to look at?'

'Elderly. Not exactly the kind of man you'd expect to have Chambers. Mostly, they're young

ones who like the freedom. An elderly gentleman: pleasant in his manners: smiling and affable: gray-haired.'

'Oh!' Then there was a real Edmund Gray of ten years' standing in the Inn, who lived or had Chambers at the number stated in the forged letters.

'I suppose,' said the house agent, 'that my respectable tenant has not done anything bad.'

'N-no—not to my knowledge. His name occurs in rather a disagreeable case. Would you be so very kind as to let him know, in case you should meet him—but of course we shall write to him—that we are most anxious to see him?'

This the landlord readily promised. 'There is another person,' he said, 'who can tell you a great deal more than anybody else. That is his laundress. I don't know who looks after him, but you can find out at the Inn. The policeman will know. Go and ask him.'

In the game of battledore and shuttlecock, the latter has no chance except to take the thing coolly, without temper. George was the shuttlecock. He was hit back into Gray's Inn—this time into the arms of the policeman.

'Well, sir,' said the guardian of the peace, 'I do not know anything about the gentleman myself. If he was one of the noisy ones, I should know him. But he isn't, and therefore I have never heard of him. But if he lives at No. 22, I can tell you who does his rooms; and it's old Mrs Cripps, and she lives in Leather Lane.'

This street, which is now, comparatively speaking, purged and cleansed, is not yet quite the ideal spot for one who would have pure air and cleanliness combined with godliness of conversation. However, individual liberty is nowhere more absolutely free and uncontrolled than in Leather Lane.

Mrs Cripps lived on the top floor, nearest to Heaven, of which she ought to be thinking, because she was now old and near her end. She was so old that she was quite past her work, and only kept on Mr Gray's rooms because he never slept there, and they gave her no trouble except to go to them in the morning with a duster and to drop asleep for an hour or so. What her one gentleman gave her, moreover, was all she had to live upon.

Though the morning was warm, she was sitting over the fire watching a small pan, in which she was stewing a savoury mess, consisting of an ornamental block with onions, carrots, and turnips. Perhaps she was thinking—the poor old soul—of the days gone by—gone by for fifty years—when she was young and wore a feather in her hat. Old ladies of her class do not think much about vanished beauty, but they think a good deal about vanished feathers and vanished hats: they remember the old free carriage in the streets with the young friends and the careless laugh and the ready jest. It is the ancient gentlewoman who remembers the vanished beauty and thinks of what she was fifty years ago.

Mrs Cripps heard a step on the narrow stair leading to her room—a manly step. It mounted higher and more slowly, because the stairs were dark as well as narrow. Then the visitor's hat knocked against the door. He opened it, and

stood there looking in. A gentleman! Not a District Visitor or a Sister trying to persuade her to early Church—nor yet the clergyman—a young gentleman.

'You are Mrs Cripps?' he asked. 'The policeman at Gray's Inn directed me here. You are laundress, I believe, to Mr Edmund Gray of No. 22?'

'Suppose I am, sir,' she replied suspiciously. A laundress is like the Hall Porter of a Club: you must not ask her about any of her gentlemen.

'I have called to see Mr Edmund Gray on very important business. I found his door shut. Will you kindly tell me at what hours he is generally in his Chambers?'

She shook her head; but she held out her hand.

The young gentleman placed half a sovereign in her palm. Her fingers closed over the coin. She clutched it, and she hid it away in some secret fold of her ragged dress. There is no woman so ragged, so dropping to pieces with shreds and streamers and tatters, but she can find a safe hiding-place, somewhere in her rags, for a coin or for anything else that is small and precious.

'I never tell tales about my gentlemen,' she said, 'especially when they are young and handsome, like you. A pore laundress has eyes and ears and hands, but she hasn't got a tongue. If she had, there might be terrible, terrible trouble. Oh! dear—yes. But Mr Gray isn't a young gentleman. He's old, and it isn't the same thing.'

'Then,' said George, 'how and when can I find him?'

'I was coming to that. You can't find him. Sometimes he comes, and sometimes he doesn't come.'

'Oh! He doesn't live in the rooms, then?'

'No. He doesn't live in the rooms. He uses the rooms sometimes.'

'What does he use them for?'

'How should I know? All the gentlemen do things with pens and paper. How should I know what they do? They make their money with their pens and paper. I dun know how they do it. I suppose Mr Gray is making his money like the rest of them.'

'Oh! he goes to the Chambers and writes?'

'Sometimes, it's weeks and weeks and months and months before he comes at all. But always my money regular and beforehand sent in an envelope and a postal order.'

'Well, what is his private address? I suppose he lives in the country?'

'I don't know where he lives. I know nothing about him. I go there every morning and I do the room. That's all I know.'

There was no more information to be obtained. Sometimes he came to the Inn; sometimes he stayed away for weeks and weeks and for months and months.

'I might ha' told you more, young gentleman,' murmured the old woman, 'and I might ha' told you less. P'raps you'll come again.'

He went back to Lincoln's Inn and set down his facts.

First, there was a forgery in the year 1882, in which the name of Edmund Gray was used.

Next, in the series of forgeries just discovered, not only was the name of Edmund Gray used throughout, but the handwriting of the letters and cheques was exactly the same as that of the first cheque, with the same peculiarities in the signature. This could hardly be a coincidence. The same man must have written the whole.

Then, who was Edmund Gray?

He was a real personage—a living man—not a Firm—one known to the landlord of the Chambers and to the laundress, if to nobody else. He did not live in the Chambers, but he used them for some business purposes; he sometimes called there and wrote. What did he write? Where was he, and what was he doing when he was not at the Chambers? He might be one—leader or follower—of some secret gang. One has read of such gangs especially in French novels, where the leaders are noble Dukes of the first rank, and Princesses—young, lovely, of the highest fashion. Why should there not be such a gang in London? Clever conspirators could go a very long way before they were even suspected. In this civilisation of cheques and registered shares and official transfers, property is so much defended that it is difficult to break through the armour. But there must be weak places in that armour. It must be possible for the wit of man to devise some plan by means of which property can be attacked successfully. Had he struck such a conspiracy?

Thus. A man calling himself Edmund Gray gets a lease of Chambers by means of a forged letter in answer to a reference. It is convenient for certain conspirators, hereinafter called the company, to have an address, though it may never be used. The conspiracy begins by forging a cheque to his order for £720. That was at the outset, when the conspirators were young. It was found dangerous, and the notes were therefore replaced in the safe. Note, that the company, through one or other of its members, has access to that safe. This might perhaps be by means of a key—in the evening, after office hours: or by some one who was about the place all day.

Very good. The continued connection of some member of the Firm with Dering & Son is proved by the subsequent proceedings. After eight years, the company having matured their machinery, and perhaps worked out with success other enterprises, return to their first quarry, where they have the advantage of access to the letters and can look over their disposition. They are thus enabled to conduct their successive *coups*, each bigger than the one before. And for four months the thing remains undiscovered. Having the certificates in their hands, what was to prevent them from selling the whole and dividing the proceeds? Nothing. Yet, in such a case they would disappear, and here was Edmund Gray still fearlessly at large. Why had he not got clear away long before?

Again—all the correspondence concerning Edmund Gray was carried on between the office and the brokers. There were no letters from Edmund Gray at all. Suppose it should be found impossible to connect Edmund Gray with the transactions carried on in his name. Suppose the real Edmund Gray were to deny any knowledge at all of the transactions. Suppose he were to

say that ten years before he had brought a letter of introduction to Mr Dering, and knew nothing more about him. Well—but the certificates themselves—what about them? Their possession would have to be accounted for. So he turned the matter over and over and arrived at nothing, not even the next step to take.

He went back to the Chief and reported what he had discovered: the existence of an Edmund Gray—the letter of recommendation to the landlord. 'Another forgery,' groaned Mr Dering.

'It is done in the office,' said George. 'It is all done in the office—letters—cheques—everything.'

'The office,' Checkley repeated. 'No doubt about it.'

'Give up everything else, George,' said Mr Dering eagerly—'everything else. Find out—find out. Employ detectives. Spend money as much as you please. I am on a volcano—I know not what may be taken from me next. Only find out, my partner, my dear partner—find out.'

When George was gone, Checkley went after him and opened the door mysteriously, to assure himself that no one was listening.

'What are you going on like that for, Checkley?' asked his master irritably. 'Is it another forgery? It rains forgeries.'

'No—no. Look here. Don't trouble too much about it. Don't try to think how it was done. Don't talk about the other man. Look here. You've sent that young gentleman to find out this business. Well—mark my words: he won't. He won't, I say. He'll make a splash, but he won't find anything. Who found out the last job?'

'You said you did. But nothing was proved.'

'I found that out. Plenty of proof there was. Look here'—his small eyes twinkled under his shaggy eyebrows—'I'll find out this job as well, see if I don't. Why'—He rubbed his hands. 'Ho! ho! I have found out. Don't ask me—don't put a single question. But—I've got 'em—oh! I've got 'em, I've got 'em for you—as they say—on toast.'

THE STORY OF A GREAT LIBRARY.

AMONG the many notable buildings which adorn the city of Oxford, few possess more interest to all intelligent persons than the institution known for almost three centuries as the Bodleian Library. It is one of the chief glories of that noble seat of learning. Sir Thomas Bodley, however, from whom the name is derived, was not the original founder of the University Library. A collection of a kind had existed for upwards of two centuries before Bodley's day, and to Bishop Thomas Cobham of Worcester belongs the honour of being the originator. It was the first lending library on record, and its primitive nature may be gathered from the fact that the books were kept in boxes and given out under pledges. This was the tiny rill which in the years to come was to broaden into a majestic river, spreading its beneficent influences over all the land. The gradual development of this great institution, second only in importance to the British Museum Library, is of considerable

interest, and, fortunately, we are able to trace it under the guidance of an accomplished official, Mr W. Dunn Macray, who two years ago signalised fifty years of 'glad labour' within its walls by the publication of a second edition of the *Annals of the Bodleian Library*, originally issued in 1868. In the volume we have details, more or less minute, of the progress of the library from year to year down to 1881, and imbedded in these details is a large amount of curious out-of-the-way matter not to be found elsewhere.

The first benefactions to the library were of course manuscripts. The art of printing as yet was not. Among the early donors may be mentioned with honour Duke Humphrey of Gloucester—of whose six hundred manuscripts it is mournfully recorded that only six survive; Richard of Bury, Bishop of Durham, but better known as the author of the work called *Philobiblon*; and Thomas Kempe, Bishop of London. Gradually, as the contributions increased, the room became too small, and a new building was completed in 1480, which now forms the central portion of the great reading-room. Almost in its infancy the library suffered a terrible disaster, not by accident, or from an enemy, but from those who ought to have been its friends. The Commissioners deputed by Edward VI. for reformation of the universities visited Oxford in 1550, and executed their duties in a very iconoclastic and barbarous fashion, destroying, 'without examination, all manuscripts ornamented by illuminations or rubricated initials, as eminently Popish.' Anthony à Wood mentions that many of these precious documents 'were burned, and others were sold to tailors for their measures, and to bookbinders for their covers, and the like, until not one remained.' But life has its compensations. Some years after this 'pillage and waste,' an undergraduate entered at Magdalen, and the soul of the young student burnt with shame and indignation at the vandalism which had taken place. This was Thomas Bodley, belonging to a family of good repute in Exeter. After several years at the university, he entered the diplomatic service, and was employed in various missions during the reign of Elizabeth. On retiring from public life, he resolved to restore the library of his *alma mater*. As he quaintly puts on record: 'I concluded at the last to set up my staffe at the libraire-dore in Oxon; being throughly perswaded that in my solitude and surcease from the commonwealth affayers, I could not busie myselfe to better purpose than by redusing that place to the publique use of students.'

During the closing years of the sixteenth century, Bodley was busy fitting up the building, and gathering contributions both in books and money; he likewise bestowed upon it a handsome sum himself as an endowment. At last, on November 8, 1603, the library, consisting of two thousand volumes, was opened with great ceremony. The year following, Bodley was knighted by James I., who jocularly remarked on the occasion that for his good deeds he ought to be called Sir Thomas Godley, rather than Bodley.

During the three centuries which have elapsed, twelve head-librarians have presided over the Bodleian. The first of these, Thomas James by name, was selected by the founder himself. It is

amusing to notice that shortly after his appointment he petitioned for an increase of his stipend, and also that he might be allowed to take a wife, which was contrary to the regulations, clerical celibacy at that period being more common than now. The rules were framed, apparently, on the supposition that the library was to be the only spouse of the librarian, and that if he took another, it would be a divided allegiance. The poor man eventually got his wife, a point being reluctantly stretched in his favour; but the absurd regulation as to celibacy was not relaxed till the year 1813, and even then, the person appointed must be unmarried when elected, but could marry afterwards, a curious example of academical compromise. Only in 1856 was the restriction entirely removed. It was also ordained that the librarian 'should have livery given him of the best cloth worn by gentlemen.'

The progress of the institution at different periods varies much; in later years the books increasing at an infinitely accelerated rate. In 1649 the volumes had accumulated to 15,975, one-third being folios. By 1714 the shelves contained 30,169 volumes of printed books, and 5916 volumes of manuscripts. In 1849 the number was 220,000; in 1860, 350,000; and in 1888, 440,000 printed books! This is the largest collection in the United Kingdom, with the exception of the library of the British Museum, which now contains 1,500,000 printed volumes.

Mr Macray remarks that in the beginning of the seventeenth century there were only two other libraries in Europe open to the public—one in Rome, and the other in Milan, the famous Mazarin Library in Paris having only been opened in 1643. This may account for the large number of foreigners, chiefly Danes, Swedes, and North Germans, making use of the Oxford Library. The total number of foreigners entered in the *Liber Admissorum* between 1683 and 1714 was 244. Regarding the lending out of books, the practice seems to have varied. In the earliest period, as already noticed, books were given out; but later on we find that both Charles I. and Cromwell were refused books by Rous, the librarian. The rule, however, was afterwards relaxed, for mention is made of the serious losses to the library from the practice of allowing books to be lent; but in 1888 it was finally agreed that no books were to be given out to any one, except in particular cases and by a special vote of Convocation. King Charles was more fortunate in getting a loan during his troubles from the funds of the library of £500, which was never repaid. The sum was kept on as an asset from 1642 till 1782, when it was finally written off as a bad debt.

Like the British Museum, the Bodleian has been munificently helped by many benefactors. Some of the earliest have been already mentioned; but other names are also to be had in remembrance, such as Archbishop Laud, Rawlinson, Selden, Malone, Douce, Sir F. Madden. The journals and other papers of the last named—the late keeper of the manuscripts in the British Museum—were bequeathed to the Oxford institution with the remarkable condition that the box in which they are contained is not to be opened till the 1st day of January 1920. Among smaller donors are Pope, Burton—author of the *Anatomy of*

Melancholy—Fairfax, Baskett, who presented a magnificent copy of the 'Vinegar' Bible in vellum. In 1620 Milton sent a copy of his Poems with a Latin ode in his own handwriting; but this and another volume were afterwards thrown out amid a heap of duplicates as worthless. About the same time James I. presented a copy of his works to both Oxford and Cambridge universities, receiving in return from the authorities of both an amount of sickening flattery almost past belief. What will be thought of George Herbert, at the time Public Orator at Cambridge, bespattering His Majesty in this fulsome fashion? 'Now that we are sprinkled with the royal ink, there is no subject too sublime for us; we can cut our way through all controversies. Would that some Jesuit might now be given us, in order that by mere friction against your Majesty's book we might pulverise the man forthwith.' Doubtless, James received all this adulation as proper and becoming. The donations, however, were not always of a literary or artistic nature—books, pictures, and the like. There were at different times such odd gifts as Guy Fawkes' lantern, a crocodile, a dried body of a negro boy, a sea-elephant, a negro baby preserved in spirits—which, the narrator observes, 'has unaccountably disappeared'—various clog almanacs, a primstaff calendar, a pair of Queen Elizabeth's gloves, and a Latin translation of an Italian sermon, written and translated by Her Majesty, as a new-year's gift to Edward VI.

There are several notices relating to the agreement with the Stationers' Company, by which they bound themselves to supply a copy of every new book to the library in return for certain advantages received. The first arrangement was made in 1610; and a hundred years later a parliamentary enactment was obtained, granting the privilege of getting copies of all new publications to nine libraries, subsequently increased to eleven—a grievous burden to publishers—but eventually reduced to five: the British Museum; the Bodleian; University Library, Cambridge; the Advocates' Library, Edinburgh; and Trinity College, Dublin. Much laxity seems to have existed, until of late years, in regard both to the proper surveillance of the works received, and also with respect to rejecting trifling or worthless publications. These matters now receive careful attention; and so exact is the practice in the Bodleian that nothing is rejected, even a blacking label or some special brand of whisky being duly entered. Interesting illustrations are also afforded of the greatly enhanced value during the last half-century of early-printed books, and still more recently, of first editions—the latest literary craze. The practice formerly in the Bodleian seems to have been to sell or give away first and early editions, when subsequent issues appeared, judging, very properly, it may be thought, that the later editions were presumably an improvement on the earlier. Early-printed books are, however, in a different category, and the comparative appreciation in which these are now held affords evidence of a more intelligent estimate of the literary history of the past. As examples of the enormous increase of value, we find, in 1788, that Steevens estimated a first folio Shakespeare as worth eight pounds,

while in 1887 the same volume was appraised by Mr Quaritch at £785. Again, in 1793, a superb copy of the Mazarin Bible was purchased by the curators of the Bodleian for £100; and in 1884, a copy, probably not so good, was sold at a public sale for £3900. While on the subject of Bibles, an extraordinary incident may be narrated here. In the year 1750, volume one of the Vulgate, on vellum, printed in 1462 by Fust and Schœffer, was bought for £2, 10s. It wanted eighteen leaves at the end; but, marvellous to relate, fourteen of these eighteen leaves were found in the bottom of a box of manuscripts sent to the library from Venice in 1818, and identified as belonging to the volume purchased in England sixty-eight years before.

One or two other extracts of a miscellaneous character may form a concluding paragraph. In 1620 there is a decision of the authorities which is a good example of the grandmotherly legislation of the period. The ordinance was to the effect that 'heretical and schismatical books are not to be read without leave of the Vice-chancellor and the Regius Professor of Divinity.' Seventeen years after this (in 1637), the 'Decree of the Starre Chamber concerning Printing' was issued, which evoked Milton's noble argument to the Parliament of England for the Liberty of Unlicensed Printing—the famous *Areopagitica*. An item of a less serious nature occurs under 1687, at a grand banquet given to James II. when visiting the library. 'Upon the king rising to depart, a scene of strange indecorum ensued; the rabble of courtiers and academics rushed upon the mass of untouched dainties, and began a disorderly scramble, in which they flung the wet sweetmeats on the ladies' linnen and petticoats and stained them.' The oddest fragment in the book, however, is a story current about 1648, that some rich Jews, with a view to supply King Charles with funds, had offered £600,000 for St Paul's Cathedral and the Bodleian Library, the former to be used as a great metropolitan synagogue. The editor, by the way, does not vouch for the truth of the story, which certainly looks somewhat apocryphal.

A BOYCOTTED BABY.

CHAPTER II.—JEM'S WIFE.

At home every one knew by the master's looks that something had happened; but no one dared to question him. Not a word did he speak to his wife as to what had taken place. The dinner to Lord Polonius and his daughter was not again mentioned. Perhaps Matthew's intention was to let his wife discover for herself; if so, he carried it out long enough to cause her a good deal of anxiety. James Bulbous, according to rule, had always dined at home on Sundays, usually staying from Saturday till Monday; but for two Sundays after these events he did not appear, nor did he write. Matthew Bulbous still was silent, and his wife was afraid to speak. She knew that her husband was aware of the reason of her son's absence. At last, neither seeing nor hearing from her son, the mother's anxiety conquered her fear.

'Matthew,' she said, following him as he went

towards his 'study' one evening after dinner—'Matthew!' He halted, and looked round. Her hand timidly touched his arm, and she could hardly speak. 'Jem,' she said, 'is anything—the matter?'

'As far as I know, he is quite well,' he answered coldly. He walked away, leaving her standing in the middle of the hall. At the door of the study, however, he stopped and thought for a while. 'Come with me,' he then said; 'I have something to tell you.'

Mrs Bulbous followed her husband into the room, and sank into a chair, trembling. She knew he had ill news to communicate, and Matthew Bulbous showed little consideration for her feelings in his method of telling it.

'You want to know about your son,' he said. 'Very well. I'll soon tell you all I know, and I daresay you will think it enough—of the kind. He has been married for six or seven months.'

She gasped, and slightly raised her hands with a gesture of dismay. Then, clasping them tightly, she stared at the husband, who proceeded: 'Who or what is she? Of course, as a mother and a woman, you are deeply interested to know. Who she is, I cannot tell. What she is—or has been—I can tell. Your son's wife'—

'Matthew!' She leaped up with a cry—this gentle and timid woman—and stood panting before him, with heaving bosom and blazing eyes. Matthew Bulbous was startled, but only for a brief time; his big hard eyes and set face soon reduced her, and she sank in the chair with a moan.

'If you doubt it, send for him and her. She'll come to you quick enough; but take care of yourself! How would you like to see her in your house—your son's wife—beside your daughter—in her painted and impudent ugliness, in her tawdry finery and rags? Why, woman, to look at her,' he exclaimed, extending his arm towards the door, as though his son's wife were standing there—'to look at her is to feel sick! A creature you would cross the road to avoid—a degraded animal, whom your very avoidance would rouse to tear and claw you. Yes, send for her, by all means; one interview will be enough.'

'Jem, Jem, Jem!' murmured the poor woman, sobbing. It was indeed harder to her than to her husband to realise that the young man could have fallen into such folly, and she felt the agony of which her husband was insensible.

He had been lured into it—trapped into it—drugged into it. It was blasphemy against nature to suppose that he had voluntarily done such a thing, with all his faculties at his command.

Mrs Bulbous, after this, was practical enough to mourn her son as dead. She knew he should never pass his father's door again. Week passed after week, and nothing was heard from him. His name was never mentioned. He was dead and gone out of their lives. His chambers had been given up—as the mother learned in some indirect way—and he had disappeared.

The room James Bulbous had been in the habit of occupying when he slept at Blackheath was locked up now—locked by Mr Bulbous

himself, who kept the key of it. The night he locked it there was a little incident which is worth relating. There were several photographs on the table, framed; the mother and sister, some friends, and that of a very lovely girl with dark eyes. Mr Bulbous examined this curiously for half a minute, holding it in his hand; with the other hand he turned over a small heap of photographs of noted persons, such as you see in shop windows.

'An actress—or a dancer—or one of that sort,' he remarked, having another look at the picture, and throwing it on the heap with the others. 'I never thought he was that kind of fellow.'

Two days before Christmas, he had a brief note from his brother Joseph—which was the first communication between them since that day at Chelsea—inquiring whether Matthew still meant him to emigrate. Matthew seemed to have forgotten the project; but he sent a message to his brother to come to the office at three o'clock the next day. Punctually to the minute Joseph was there, and the clerk was sent out of the room.

'If you still mean it,' observed Joseph, with the manner of a man resuming an interrupted conversation, 'I would prefer New Zealand. The climate is better, and I couldn't go to Canada for months yet. I don't care for Canada.'

'As you please,' said Matthew indifferently. 'Let it be New Zealand, then; and as you are in a hurry to go, the sooner the better. Go to the tailor's and order an outfit. I'll see to the rest.'

Then there was a pause. There seemed no more to be said on the particular subject. After a while, Joseph inquired concerning the health of his brother's wife and daughter, then there was another pause. At last Matthew asked if Joseph knew anything about Jem.

'I didn't like to mention his name first, Matthew,' he answered. 'Yes; I saw him last night. He supports himself by writing for the papers and things now.'

'Yes. Anything else?'

'Well—his wife is'—

'Stop!' Joseph stopped very quickly, and looked at his brother.

Matthew's face was dark, but presently it cleared, and he observed: 'I feel no interest in that quarter. I asked about Jem. I didn't want to hear about her.'

'I thought you might be interested to know'—

'That there's a baby?' said Matthew, with a grin that showed his mouth to great disadvantage. 'I'm sure I'm delighted!'

'To know,' continued Joseph, not heeding the interruption, 'that Jem's wife is—dead.'

Matthew Bulbous leaped to his feet. He drew back the chair, and looked intently at his brother. 'Dead, did you say? When did she die? What did she die of? There's no mistake about this?'

'Died yesterday morning. Found dead in her bed. Heart disease, the doctor said. No mistake at all, Matthew, as you may see for yourself if you like to attend her funeral tomorrow.'

'I attend her funeral? I'd see the woman—ahem; well, that sort all end that way. I'm not

a bit surprised,' he observed, with a deep-drawn sigh of relief.

He could not sit on the chair now. He walked about the room with his hands in his pockets. Mr Matthew Bulbous was powerfully excited, for the liberation of his son was fraught with momentous possibilities. But as Joseph was sitting there, eyeing him with a curious interest, and waiting to be sent away, Matthew had to come back to him.

'You may come over to Blackheath to-morrow, if you like,' he said, 'after the funeral. You are going to the funeral, I suppose?'

'Yes, I'm going.'

'Come over after the funeral. As it will be Christmas Day, you may stay for dinner if you like. What hour is the funeral to be?'

'Two o'clock.'

'Come over immediately afterwards. I shall expect you at four. Have you any money?'

He took a few sovereigns from his waistcoat pocket and threw them on the table. Joseph Bulbous picked them up and went away.

After his brother's departure, Matthew Bulbous sat down and leaned back in the chair with his large eyes staring vacantly at the inkstand on the table. His senses were unconscious of outward things—even of the absence of the clerk, who was idly waiting outside to be summoned back to his work. Bulbous was filled with deep and absorbing joy. Jen's wife was dead. The detested obstacle to his ambitious projects was removed. It was not unreasonable to suppose that the event must be a happy relief to the young man himself. The experience would chasten and subdue him, and generally be good for him. After just a little delay, sufficient to wipe out the last miserable vestige of the late wife's memory, the young man would be ready to accept with gladness his father's schemes. Jen's wife was dead. Oh, the silent and mighty upheaval of Matthew Bulbous's energies, paralysed for the time by his son's unfortunate marriage, now that friendly Death had undone it, in fairly good time! Everything would, and should come right now—now, that Jen's wife was dead.

Matthew's action was prompt. Jumping into a cab he drove to Lord Polonius's club, and found that nobleman there. His lordship received him civilly, but curiously. Lady Jessalinda was quite well, he politely assured Mr Bulbous; and then the latter proceeded to business, stating the case briefly and clearly. At first the Earl listened with an affectation of polite indifference; but he soon showed his interest. Mr Bulbous explained very plainly the folly of his son, and the bitterness of his repentance, and assured Lord Polonius that the young man was ready now to do his part with proper spirit to promote the early realisation of the project upon which they were both so cordially agreed a few months ago. Bulbous did not put his thought in words, but he felt no apprehension of his son's matrimonial prospects having been interfered with by the addresses of another suitor in the interval.

'Well—ah—really, Mr Bulbous, it requires consideration,' observed Lord Polonius gravely.

'Why should it?' Mr Bulbous asked, the case not being one for sentiment. 'It has been considered already in all its points. Unless, indeed,'

he added, as an act of politeness of which he privately did not see the necessity, 'unless Lady Jessalinda'—

'Yes, that's it,' said his lordship quickly; 'we do not know exactly how Lady Jessalinda will regard it. Ladies are sensitive of such an experience, and, as a rule, do not prefer newly-made widowers. We must take all this into consideration.'

Matthew Bulbous, anxious as he was about his project, began to stiffen. He suspected that this clever old peer was laying himself out to extract further pecuniary concessions. 'Do you propose to reopen the matter with Lady Jessalinda, my lord?' he asked, with ominous coolness.

'I did not mean to leave any doubt as to that,' said Lord Polonius, who, from his own private interests, was as anxious as Matthew Bulbous to carry out the project; 'it is as to the result that there may be a little doubt. I only meant to imply that, naturally, it will be less easy to win Lady Jessalinda's consent now than it was a few months ago.'

In private, Matthew Bulbous was not so sure about this; but still, women were women, and there was no counting on their whims. Lord Polonius, in conclusion, promised to drop in upon him later in the afternoon, and Mr Bulbous took his departure.

At six o'clock his lordship called. 'I have spoken to Lady Jessalinda,' said Lord Polonius in a confidential whisper, 'and I think we may venture to hope that—ah—matters may in time—ah—not impossibly resume their former footing. Of course we must allow a little time, so as to forget the—a certain episode. Then, we may proceed again.'

'That will do,' said Matthew Bulbous, understanding aright the meaning conveyed by the Earl's circumlocution. 'How long will it take?'

'Well, as to that, we can lay down nothing definite. Now, if your son would go abroad for a while'—

'He's going,' said Mr Bulbous promptly; 'but the question is, how long is he to stay abroad?'

'He can be recalled when it is considered judicious,' said Lord Polonius. 'Of course he will keep you advised of his address. I do not think,' he added, lowering his voice again and significantly pressing Mr Bulbous's hand, 'his exile need be very long.'

Matthew gave a gratified smile, which our American cousins would describe as of large dimensions; but the next moment an observation casually made by Lord Polonius quickly changed the expression of his face.

'Of course,' his lordship observed, pulling on his gloves, 'there is hardly need to mention it, but of course the understanding is entirely upon the assumption that there is no surviving issue of the—the marriage?'

These were ominous and startling words, because the Earl meant them, and they suggested a possibility of which Matthew had not thought before. But the situation was critical and he was equal to it.

'No, my lord,' he answered with confidence, 'there is no child of that marriage.'

'Ah, that is satisfactory. I trust everything will go on well now,' said the Earl; and then he

took a gracious farewell of Mr Bulbous for the present.

Matthew Bulbous went home in high spirits. His old luck had not deserted him, after all. He felt himself to be a man who could not fail. He might have known himself better than to have felt beaten by Jem's marriage. Here was the demonstration that he was still the same successful man!

The church bells were ringing as he walked up the frosty road from the station. As a rule, it was a noise he hated; but to-night the bells pealed a tune that gladdened his heart.

'Jem's—wife—is—dead!

Jem's—wife—is—dead dead dead!

Jem's—wife—is—dead dead dead DEAD!

So the bells rang out in the clear frosty sky. Matthew Bulbous laughed, and wished them a Merry Christmas.

At dinner, his wife and daughter were struck with the exuberance of his spirits. After dinner he made Agnes play several 'lively' pieces on the piano—an instrument he only loved less than church bells—and said something about buying her a new one. For the keys gave out the same carol as the bells, no matter what she played.

Later on, he called his wife into his study, and exultingly announced the great news to her. The result startled him.

'Matthew!' she exclaimed, with natural horror, 'surely you are not rejoicing over the poor creature's sudden death!'

'Surely I am, though. Pray, why shouldn't I?' he demanded defiantly.

'It is wicked—horrible! No, Matthew,' his wife said with a shudder, 'she is dead, and past all enmity.'

'I have no enmity,' he growled. 'She wasn't a fit subject for enmity. But I say what I feel, and I cannot but feel glad. Have you no thought for your son? Are you sorry for his release?'

But his wife, without further word, left the room, and Matthew Bulbous put down his pipe, pushed away the half-consumed toddy, and stared angrily in the fire. When he was angry, it was a sign he was conscious of having made a mistake. Undoubtedly, he was glad of the woman's death, and believed he had a right to be glad; but perhaps the exhibition of his joy was not exactly proper. After all, Jem's wife was dead, and could do no further harm. As the harm which she had done was being happily remedied, it might have been better to ignore the fact that she had ever existed. And considering her miserable life and miserable end, her death was probably an unworthy and indecent subject for exultation.

Matthew Bulbous was a coarsely-bred man, not free from superstition, and at heart a coward. Hence the words of his wife disturbed him, and howsoever he might have despised his son's wife when living, he was not so sure that the dead could be treated with the same impunity. In fact, he uneasily felt that on the whole it was best to leave the dead alone. In the fading embers of the fire, the wasted and rigid face of the poor creature who had already passed before her Judge met his eyes oftener than he cared. With the

fire, his energy of mind seemed to sink also, lower and lower as the time passed.

Just as the chimes of midnight startled him, as from a troubled sleep, the most extraordinary thing came to pass that ever happened to Matthew Bulbous. The door opened, and a female figure glided into the room. The lamp was turned low, and he could not see her distinctly; a shawl hung over her head, half concealing her face, and the gloom hid the rest of it; but he experienced a strange and unaccountable sense of recognition. He was convinced he had seen the face before—he knew not when or where—though he certainly did not see it now. She did not speak for some time, but stood before him in a silent and expectant attitude, as though he had sent for her. The strangest thing was that he knew this to be the apparition of his son's wife, while at the same time it was certain that the invisible face was not the face of the dead woman.

Jem's wife had been so much in his thoughts, that this sudden visitation took him, in a manner, at a great disadvantage. But it was nevertheless a situation of a character with which he was not well fitted to cope. Some time elapsed, therefore, before he could bring himself to address her with an inquiry, in a respectful and conciliatory tone, as to her identity and business. She turned slowly towards him and told him (as he expected) who she was.

This confirmation, in spoken words, of his previous conviction had the effect of disturbing his mental equilibrium still further. In vain, rallying his courage, he assured her she was mistaken—that Jem's wife was dead, and was to be buried at two o'clock next day—that she had been found dead in her bed, dead of heart disease, brought on by her own conduct, as the doctor said. This discharge of hard facts and exact information seemed not to affect her in the smallest degree. Then it occurred to him to summon the butler, and he rang the bell with nervous energy. The effect amazed him, but seemed not to disconcert his visitor in the least. The butler and other servants were either not in the house, or they were buried in the sleep of the Seven Sleepers, or they were all dead. For the bell rang loud and long down the passage, up the stairs, through all the rooms in the house, and finally passed up the chimneys, and died away in the sky; but no person answered it.

Matthew Bulbous listened to this extraordinary performance with fear perspiring from every pore. He felt now there was nothing left but to ask his visitor humbly to state her business. He abjectly pleaded that he was tired and wanted to go to bed. Then the dark reproachful eyes settled upon him, from out the shadow, with a gentle scorn which caused him to look another way as she delivered her message. They had been happy, her husband and she, and did not want Matthew Bulbous's money. He had cast off his son because he failed to marry him to a grand lady. He was rejoicing now because the son's wife was dead and the grand lady might still become his wife. The visitor knew all Matthew's thoughts and schemes. Very well; but she added, with a movement that made him start, that she had left a baby, and would hold him to account for it. 'According as you are

kind and just to it, I will be merciful to you. It has no mother, and you must supply my place !'

A dim apprehension of consequences likely to arise from the existence of a baby passed like a cold wave over Matthew Bulbous. Did she know the assurance he had given Lord Polonius, and was she warning him? Did she mean that, to supply her place, he was to get Jem immediately married to Lady Jessalinda? There were doubts on this point; it was contrary to all experience of her sex that she should be anxious to be quickly succeeded by another wife, and to place her baby on the bosom of a stepmother; and it was extremely doubtful whether Lady Jessalinda would consent to dedicate herself to that maternal office.

But he gave his solemn promise to look after the child; and as he spoke the words, there was a knock at the door. Looking up, he discovered that his visitor was gone. With the instinct of a man of business, his first thought was whether she had heard him make that promise concerning the baby. He would have given a thousand pounds to be certain she had not heard the words. Could she possibly, he asked himself, have heard them, seeing that she was gone when he looked up?

The appearance of the butler at the door, inquiring if his master wanted anything further that night, gave him a considerable start; and he rose to his feet quickly, looking hard at the spot where the visitor had been standing during the late interview.

'No, Perks,' he answered absently, drawing a deep respiration. 'I—I believe I have been asleep !'

But the conviction that he had been dreaming did not restore a tranquil mind. All night through his thoughts were haunted with shadowy fears. That face, hidden from physical perception, but still familiar though unaccountable, was no trick of fancy. And he could by no effort rid himself of the fear that the baby might be a dread reality, worse to face than the ill-starred marriage which it sprang from—a reality that would have to be 'boycotted' with vigour and thoroughness.

NAVAL SAVINGS-BANKS.

WITH a desire of promoting and encouraging habits of thrift among our sailors and marines, and placing their hitherto neglected finances upon a satisfactory footing, an Act was passed in 1866 for the establishment of Naval Savings-banks. By this enactment, power was given to the Admiralty to institute them. It was also decreed that regulations for their guidance were to be made by Orders in Council. The Privy Council were further empowered to prescribe the rate of interest to be paid to depositors. This was in no case to exceed £3, 15s. per cent. per annum. It was also ordained that all Orders emanating from the same high authority regulating the conduct of these banks should be notified in the *London Gazette*. Furthermore, it was provided that a balance-sheet, showing by full information the result of their operation, should be annually laid before both Houses of Parliament.

Nor were these pecuniary safeguards, which have so materially contributed to the welfare of those who constitute the bone and sinew of our ships of war, unneeded. For surely there was cause and effect enough to account for this wise and judicious measure. In the absence of such auxiliaries to aid economy during the term of a long roving commission, the baneful result was, that when ships were paying off, or when paid off, our men's pockets were invariably at dead low-water mark. Succeeding generations have changed the fashion somewhat; but even nowadays Jack and Joe, with any superfluous cash about them, are often distinguished for the indulging of profuse generosity almost amounting to unjustifiable rashness and folly. Moreover, it was no easy task to implant the seeds of economy into the lower ranks of our navy. Just as the Admiralty comprehended it to be their best policy to promote all possible improvements on the lower decks of our warships, and create a desire on the part of those who man them to put by something for a rainy day, so there was, at first, on the part of the men a great disposition to behold such laudable efforts put forth on their behalf with comparative passiveness and unconcern. In recent years, however, a remarkable change and astonishing improvement have taken place. Slowly but surely those for whose special benefit these banks were organised began to realise the inestimable advantages thus conferred upon them. That these institutions have now gained abundant favour and large custom, the following facts and figures, taken from the last Account presented to Parliament, proclaim.

The accounts open and opened during the financial year numbered 24,966. This stream of business formed a remarkably striking percentage of the 38,388 seamen and 12,066 marines then serving in the fleet and at marine headquarters. In the same period 7341 accounts were registered closed; thus leaving the final number of those men of sense and economical resolution standing at the highly respectable total of 17,625; a pretty satisfactory proof how freely these banks have been taken advantage of. The addition of £146,431, 18s. to swell the deposits is particularly excellent, which is more than can be said concerning £145,683, 7s. 8d., representing withdrawals. The accumulated savings, including £7338, 11s. 4d. accrued as interest, stood at £201,505, 16s. 8d. A gratifying surplus of £1804, 17s. 2d. raises this total to £203,310, 13s. 10d. as the net balance standing to our men's credit. These figures show that each depositor's acquisition averages £11, 9s. a head. Considering that the mean pay of an able seaman—continuous and non-continuous service—is only 1s. 5½d. a day, or £26, 10s. a year; whilst that of a marine private is a paltry 1s. 2d., or £21, 5s. 10d. annually; and in addition that bluejackets have to provide themselves with an extensive and expensive kit out of their scanty wage, the signifi-

cance of these returns cannot be overrated. Another benefit, too, was reaped which was none of the least: a sum of £5839, 5s. 3d., paid as interest, undoubtedly proved a source of pleasure and satisfaction to the saving, and of dolefulness to the improvident.

The regulations governing these banks are simple, intelligible, and altogether free from the proverbial red-tapeism usually so eminently characteristic of Admiralty ventures. In them there is a strong family likeness to the Post-office Banks. The interest paid afloat, £3, 15s. per cent., is, however, better. Unlike them, there is no limit to the amount which may be deposited in one year. Their general supervision is vested in the Commanding Officer. The Paymaster is regarded as their manager, with the Accountant Staff as his assistants. The banks are open for transacting business whenever monthly advances are paid, and failing 'advances' being required the captain shall settle a day for them to be open. He has also to appoint a commissioned officer to attend personally and witness receipts and payments. In cases of necessity, the latter are made at any time. Each depositor is furnished with a neat and strong pass-book, which bears on the corner his official or regimental number. In this all entries are verified both by the Paymaster and officer witnessing payments or withdrawals. When a depositor leaves one ship, his deposit can be transferred to another, although pay and savings-bank documents are quite unconnected, and studiously kept distinct, except the Paymaster's cash account, in which are debited and credited respectively the amounts deposited and withdrawn. Whenever depositors are discharged, promoted, or paid off, their deposits can be transferred to a Post-office Bank; assigned for payment at the Admiralty; remitted for payment at the men's own homes; paid in cash by the Paymaster in the presence of the captain; or, all or part can be transferred to a dockyard bank. In the case of marines, their deposits are transferred to the Naval Savings-banks of their respective divisions, or they may elect any of the foregoing methods of disposing of their savings. Should a death occur, the account is sent, together with the deceased's pass-book, to the Accountant-general of the navy for settlement with his representatives.

There is a striking peculiarity, too, about these banks. They are perfect models of skilful and economical management, their cost to the country altogether being only £144, 19s. annually!—a writer, exclusively employed at Portsmouth on this work, and non-commissioned officers of the royal marines, acting as clerks, receiving pay and allowances only. The remainder of the whole compass of this business is performed by Accountant Staff on board ship—in addition to their own work—without any remuneration whatever. This cheap method of working indicates that the public interests are most carefully studied. It is hardly possible, however, that such a one-sided arrangement satisfies both parties.

An institution like this, as it gradually gains strength in our royal naval service, cannot fail to exercise a corrective and restraining operation upon squandering propensities and infuse a decided taste for frugality. Nor is this spirit of self-denial, growing in the ranks of our sailors and

marines, unattended with solid and substantial happiness even after their rough and adventurous service career has given place to retirement and tranquillity.

BRONCHOS.

EVERY person in the West of the United States of America is familiar with the word *Broncho* and its meaning; even the uneducated cowboy will tell you a 'Broncho' is a wild-horse. Webster derives the word from the Spanish *bronco*, rough, wild. Whether these horses are of Spanish origin, such as are found on the prairies of Texas and Mexico, or the result of breeding between the Indian ponies and well-bred horses, such as roam in immense herds in California, Oregon, Washington Territory, and Montana, it makes no difference, for these animals in their wild state are all properly called bronchos. Neither size nor build has anything to do with the name, for there are bronchos large enough to be used as stage and draught horses, as well as those smaller ponies used by the cowboys to run cattle with. The generally prevailing idea, except amongst those who work with these horses, is, that a broncho must necessarily be a small vicious pony, only fitted for the cattle-camp; but such in reality is not the case, for in many of the herds in the northern Territories where attention has been given to breeding, large well-built powerful horses can be found which would never be recognised, after they are broken, as half-breeds, except for the brand of the owner of the herd burnt on the animal's hip or shoulder.

The bronchos of the South are easily recognised from those bred in the North by their smaller size and slighter build, as well as by the brands. Especially is the latter feature noticeable, because, as a rule, the Texan or Mexican owner brands with Spanish characters, and often covers the whole hip and shoulder with deep-burnt scars, which have more the appearance of the map of some uncivilised country, and are wholly unintelligible to residents of the North. As they differ in size and build, so do they differ in disposition. Here is where blood tells; and while the southern broncho represents in a marked degree the disposition of the Greaser (low-type Mexican) and Indian, the northern specimen mirrors the more trustworthy and substantial qualities possessed by the miner, lumberman, and farmer.

The broncho of Spanish origin as a rule is never thoroughly broken, no matter how old he grows or how hard he is ridden; a short rest is all that is necessary for his untamable and often vicious spirit to assert itself. Many an old cow-pony which has been ridden for years will invariably buck every time he is mounted. That bucking is peculiar to bronchos; and from personal observation, I have discovered that the southern-bred is entitled to the distinction of being able to buck harder, faster, and with more variations, as it were, than its northern cousin. He can arch his back higher, get his nose nearer the ground, at the same time that his body is in the air, and strike the ground with all four feet nearer in one place than any of his half-bred

cousins of the North ever thought of doing. While as a general rule the northern broncho never bucks after he is fairly well broken, his Spanish cousin as a general rule bucks both before he is broken and afterwards.

While the different climatic influence and breeding has given the northern and southern distinctive characteristics in some respects, in one—that of endurance—no difference can be discovered. No matter how long the road, the broncho will reach the end of it. For one to travel sixty or sixty-five miles between sunrise and sunset, and repeat the performance for more than one day, is no extraordinary test of endurance; in fact, ponies weighing no more than seven or eight hundred pounds have been known to carry a heavy man that distance and show no bad effects afterwards. The Indians will often ride a two-year-old colt at a gallop for a distance of ten or fifteen miles without drawing rein, then dismount, let it graze and drink; remount, and repeat the dose. But among the whites it rarely if ever happens that they break a broncho before it is four.

Until breeders commenced raising this class of horses in the North, only one means was ever used to break them. The idea that a Spanish broncho could be better broken by care and kindness never entered the heads of the *vacqueros*, as the riders of wild-horses are called in the South. The lasso was used to catch the animal wanted, and at once it was thrown, blindfolded, and a saddle girthed or, as we say, 'snicked' on its back; then, without a moment's delay, the *vacquero* mounted, drew the folds from the frightened and maddened animal's eyes, and drove the big spurs deep into its sides. The fight for mastery was thus inaugurated, and a regular bucking entertainment commenced. The rider's main object was to get the horse to running, instead of making a series of high jumps and alighting almost on the same spot each time with nose to the ground and all four feet as nearly close together as it is possible to place them. Usually, you may consider your broncho conquered if you can get it to run; but otherwise, it may conquer the most accomplished and daring *vacquero*, because the continued force of the beast's striking the ground will after a while cause blood to flow from nose, mouth, and ears; indeed, men have been bucked to death by a particularly vicious broncho.

After it is conquered, then it is considered broken, for but little attention is paid to teaching it to respond to the bit; that, it is expected to learn by practical experience. But as the breeding of the broncho with graded horses has demonstrated that it improves in size and build and general disposition, even though its untamable wildness is apparently as strongly defined, the idea that more civilised methods should be adopted in breaking it for service has forced itself into men's minds, so that to-day it is no rare sight to see a broncho caught from the herd and subjected to the restraints of a biting harness and gradually taught, with care and kindness, what is required of it. Of course, such a method is looked on with contempt by the *vacqueros*, who usually are of nearly as wild and untamable a nature as the animals they risk their lives in conquering. Indian ponies are

really not entitled to the name broncho, because they are never in a wild state; from the time they are foaled, the squaw and children handle them; indeed, most of the young colts in a herd of Indian ponies will be found decorated with coloured flannel or cotton collars with bells attached; and the young boys will often be seen riding colts not yet a year old; while the warriors themselves don't disdain to ride them as early as eighteen months and two years. Were it otherwise, I doubt if the Indian would ever break his ponies, because, although they can ride a long distance, yet they are not as a rule good rough-riders.

FLATTERY.

Oh, you pretty Robin, keeping watch beside a lowly dwelling,

Where the happy sunshine rushes o'er the gorse bloom bright and gay,

Where the blackbirds and the thrushes are their loud love stories telling—

Do you know, I fancy, Robin, you as sweetly sing as they.

Do you see that verdant meadow where the buttercups are growing,

Where the golden-hearted daisies twinkle 'mid the tender grass?

Do you mark the lights and shadows that the fleecy clouds are throwing,

As across the sky of azure they fantastically pass?

Just above it there's a cottage, sheltered by the budding beeches,

Where the cherry bloom is scattered on the serried crocus lines

By the playful south wind's antics, where the glistening ivy reaches

To the red-tiled roof and chimneys where the green wisteria twines.

Pretty Robin, there's a maiden tall, and fair, and rather stately,

With a voice as soft as yours is, dwelling in that very cot,

And her tresses catch the sunbeams, though she speaks and moves sedately,

And her eyes are just the colour of a blue forget-me-not.

Whisper, Robin—can you tell me is she wand'ring by the river,

Where the catkins clothe the willows and the water-cresses grow?

Tell me, Robin, pretty Robin, and I'll be your debtor ever,

For her father does not love me, and so, mind you, whisper low.

WILD LIFE IN A TOWN GARDEN.

THE lover of Nature, and hence of outdoor instincts, condemned by untoward fortune to spend his days in a busy town, has his compensation if he possesses a garden. Let it be but that circumscribed plot commonly attached to the middle-class villa, it is still a *rus in urbe*, a breathing-ground, a place wherein he may profitably study the fauna and flora of his parish. There he can escape for a time the soul-warping stress of business cares, and indulge, in comparative solitude, the finer, contemplative fancies of his brain. But it goes without saying that a due appreciation of his consolation is impossible if he is of the no-eyes kind. He must needs be a careful observer of small things, a student of the apparently trivial, a scrutiniser of the microscopic. 'None of us—poor street-struck creatures!—can see the things we ought to see,' remarks Mr Besant, in his *Eulogy of Richard Jefferies*. True; but then we seldom try, and rarely care to see the innumerable wonders that Jefferies found in a hundred yards of hedgerow. Yet, when the faculty of looking at unconsidered trifles is formed, it grows with astonishing vigour, and is an unailing solace and relaxation. For instance, we know a clerk with a zeal for ornithology, who, between his house and his place of business, both within the town, has discovered forty-seven species of birds, including several scarce varieties. No-eyes people who use that road daily regard the walk as a penance, but to our friend it is fraught with the perennial pleasure of natural research.

It will perhaps surprise some of our readers to learn that while strolling in a garden, thirty-five yards in length and twenty-five in breadth, in a central part of a town of sixty thousand inhabitants, we have within a year put up a partridge, seen wild-ducks fly over, watched herons daily winging their way above adjacent factory chimneys, seen an owl, noticed over a hundred varieties of insects, and formed an interesting intimacy with a sagacious and melancholic toad. Yet

these are facts, and we live in daily anticipation of still adding some unlikely specimen to our catalogue of things seen.

Perhaps the best time for a zoological excursion in our domains is before breakfast. The spring sunrise has been welcomed by the loud song of a fine blackbird in a neighbour's birch-tree. Soon after five the merry fellow woke us with a carol that brought calm waking thoughts of woods and meads touched with the faint green of this belated spring. There sits our friend of the past three weeks, 'a molecule of song' clad in shining jet black, with a yellow bill open before the glowing hues of sunrise. No discordant sounds from the surrounding houses or in the street mar the full melody of the warbler; every note is clear and distinct as it hovers on the still air. But in spite of his gratuitous music, we have a grudge against the bird. He has despoiled our early primroses. Several flowers are nipped off the stem, and are strewn on the bed. It is too bad! We have given him *carte blanche* to hunt the lobworms on the lawn, and to make his breakfast upon slugs in the flower-borders, and this is how he repays our hospitality. But a brave defiant note is his only answer to our remonstrances, and we cannot choose but forgive him when he flies into the top branches of our acacia tree, and bids us a blithe good-morning.

Two starlings are seated wing to wing on the eave of the roof, chatting about the late spring and the perils of the past rigorous winter. These are odd, confiding, sociable creatures, with some of the jackdaw's cunning and sense of humour. They often alight on the lawn, when they know that our wary grimalkin is lying in ambush behind a lilac tree, then lure him to within a yard or so, and with cackles of derision, fly up to the eave to exasperate him with guttural bad language. If you whistle softly to these starlings they will answer with a sibilant note, listening parrot-like and intelligently, with their heads held on one side. One often envies Thoreau his occult faculty of taming birds. We are sure these engaging starlings are worth cultivating,

but alas! they will not permit us to approach so near as they will our cat.

We cannot boast of a bird's nest this year, but in the ivy near the garden door are the remains of a robin's house, constructed of worsted, string, feathers, and shreds from a doormat. A pert cock-robin haunts the garden, and bullies the sparrows; but we believe he is unmated. An industrious bumble-bee, evidently bent on a long day's work, is buzzing around a white hyacinth. Later on, the working-bees will visit the flowers to search every creamy bell, and learn, to their vexation, that the big marauder was up first and has filched the honey. When a chill breeze bends the daffodils, the bumble-bee finds that it is bad policy to rise 'in the morning early' in spring-time. A wave of cold east wind seems to paralyse him, and, like a portly alderman who has dined indiscreetly, he sprawls on his back beneath the hyacinth.

There are no butterflies to-day; but in summer the Small White flutters along the borders; and now and then one of the fleet-winged Vanessa tribe, the Peacock, Red Admiral, or Small Tortoiseshell, fans its wings on the flower-border. At dusk, the Gamma moths hover like miniature humming-birds over the patches of mignonette and dwarf nasturtium; the frail Magpie Moth flits through the shrubs; and in the dark, many weird, dusky lepidoptera fly before the gaslight rays of the open window. On the ground in autumn we have found the handsome green and lilac larva of the Privet Hawk Moth. This caterpillar feeds on privet, and in the autumn goes to ground, and is a shiny chrysalis until summer, when one fine day it emerges in the form of a large moth. How mysterious and beautiful are these three transformations from the egg on the privet leaf to the larva, chrysalis, and finally the imago, in the glory of pink, brown, and yellow, blended with the exquisite taste of Nature!

In a streak of sunshine on the gravel dwells a community of black ants. For longer hours than the hardest-worked human being, these untiring creatures toil and come and go in the teeming thoroughfares of their city. Their artisans never strike or clamour for an Eight Hours' Bill; yet they share, with much of man's intelligence, his temptation to 'scamp' work. Huber tells us that 'on the visit of an overseer ant to the works, when the labourers had begun the roof too soon, he examined it, and had it taken down, the wall raised to the proper height, and a new ceiling constructed with the fragments of the old one.' Occasional observers are unable to discover much method in the hurrying to and fro of these remarkable insects, and were it not for the contrary evidence of Huber, Sir John Lubbock, and others, we should be inclined to regard them as creatures of boundless but superfluous energy. But the ordinary person does not watch ants long enough, and often enough, to understand their operations. Give an ant eyes of wider scope, and set him on a roof in Cheapside, and he would wonder why black throngs of men speed up and down the street all day to no apparent purpose.

We are not certain that the toad is indigenous to the garden; he may be an importation of a former tenant. As a rule, he shuns society; but in wet weather he is sometimes tempted from his

forest hermitage behind the shrubs, and will sit bandy-legged, blinking his golden eyes on the watch for insects. Only once have we heard his thoughts expressed in his odd saurian tongue, and that was when our cat alarmed him by carrying him in her mouth to the kitchen. We have heard a man offer to eat his hat, but toads make a practice of eating their old coats. We have not witnessed our toad make the meal; but the Rev. J. G. Wood says that these reptiles, after shedding their skins, roll them into balls, take them in their paws, and push them into their mouths. We know no better instance of frugality!

At half-past seven every morning a heron flies over the garden. When first visible, it is no bigger than a skylark; but as it nears, its long neck and spindle legs are easily seen. Rooks pass over in the early morning and at sundown. Ducks fly high above the smoke in winter. On a dark night, seated by the fireside, one may hear the humming sound of hundreds of wings. The sound is suggestive of Macbeth's weird sisters flying through 'the fog and filthy air' on birch besoms. You open the window, and thrust out your head. Stars are twinkling, and an orange moon shows above the slated roofs; but no birds can be seen, though the wing-sounds on the frosty air tell of a great flock.

Swallows and martins are daily visitors in summer. At twilight they skim and flash above the acacia, swooping now and then into a cloud of midges, and screaming in mad frolic, like children at a game of romps. When, from the dark shadows of the trees, bats flit into the light of the parlour window, the swallows disappear for a few hours, to come again at dawn. We cannot claim the owl for an actual visitant, for it merely flapped across the garden about ten one summer evening. But another strange comer, a partridge, we roused in a sequestered corner during a frost. We were delighted to find game in our covers; still we have thought it scarcely worth while to buy a gun and a license. Sarcastic friends say, 'Don't you think it was a tame one?' But who ever heard of a domesticated partridge? There is no doubt that it was a genuine wild bird, driven to the haunts of man by the severe weather and scarcity of food. We have two varieties of worms—the lob and the brandling. The first kind get up when the birds are gone to bed. Before Darwin wrote his work upon *Earthworms*, we suppose most persons never thought about lobes unless they wanted some for fishing. Since then we have been more tolerant of worms, though their casts sadly disfigure the lawn. 'Things appear to go on in the night in the garden uncommonly,' says Mr Charles Dudley Warner, in *My Summer in a Garden*. The casts are among the 'things' that 'go on.' Now, we are ready to admit with the scientists that these casts are the beginnings of mountains; but we don't want a mountain in the garden, and as long as we can borrow a neighbour's roller, we intend to retard its growth. A friend of a money-making disposition suggests that we should 'encourage' the lobes by constantly watering the lawn, and sell them to fishermen. Perhaps the idea is worth consideration. We have heard that a big trade in lobes is done in the neighbourhood of Nottingham.

A great dragon-fly, locally misnamed a 'hoss-stinger,' sometimes visits the garden on hot days, and hawks invisible insects that hover over the flowers. It is a graceful, harmless insect, and as it does not possess a sting, it cannot be called a stinger. We have several of the large plethoric spiders, that spin beautiful webs from twig to twig, and catch bees, small moths, and flies. They are handsome, intelligent, and truculent insects, with strange geometrical propositions in gold on their brown backs; and they have none of the Satanic attributes of the long-legged, black, hairy house-spiders. It seems odd that those frail gossamer strands, spun from the creature's body, should be strong enough to support its weight; and yet strong winds do not injure the delicate web.

These are only a few of the denizens of our estate. A German specialist in natural history would find material for a life's study and several ponderous volumes in our back garden. It is a museum of living wonders, a verdant oasis in a desert of bricks and stones, the haunt of singing birds, and we trust that we are duly thankful for its delights.

THE IVORY GATE.*

By WALTER BESANT.

CHAPTER XIV.—THINGS MORE REMARKABLE.

AFTER such a prodigious event as the discovery of these unparalleled forgeries, anything might happen without being regarded. People's minds are open at such times to see, hear, and accept everything. After the earthquake, ghosts walk, solid things fly away of their own accord, good men commit murder, rich men go empty away, and nobody is in the least surprised.

See what happened, the very next day, at the office in New Square. When George arrived in the morning he found that the senior Partner had not yet appeared. He was late. For the first time for fifty years and more, he was late. He went to his place, and the empty chair gave an air of bereavement to the room. Checkley was laying out the table; that is, he had done so a quarter of an hour before, but he could not leave off doing it: he was loth to leave the table before the master came: he took up the blotting pad and laid it down again: he arranged the pens: he lingered over the job.

'Not come yet?' George cried, astonished. 'Do you think that yesterday's shock has been too much for him?'

'I believe it's killed him,' said the old clerk—'killed him. That's what it has done; and he went on muttering and mumbling. 'Don't,' he cried, when George took up the letters. 'P'raps he isn't dead yet—you haven't stepped into his shoes just yet. Let them letters alone.'

'Not dead yet. I hope not.' George began to open the letters, regardless of the surly and disrespectful words. One may forgive a good deal to fidelity. 'He will go on for many years after we have got the money back for him.'

'After some of us'—Checkley corrected him—'have got his money back for him.' He turned

to go back to his own office, then turned again and came back to the table. He laid both hands upon it, leaned forward, shaking his head, and said with trembling voice: 'Did you never think, Mr Austin, of the black ingratitude of the thing? Him that done it you know—him that eat his bread and took his money.' When Checkley was greatly moved, his grammar went back to the early days before he was confidential clerk.

'I daresay it was ungrateful. I have been thinking, hitherto, of stronger adjectives.'

'Well—we've agreed—all of us—haven't we?—that it was done in this office—some one in the office done it with the help of some one out: some one who knows his ways'—he pointed to the empty chair—'some one who'd known all his ways for a long time, ten years at least.'

'Things certainly seem to point that way'—'and they point to you,' he would have added, but refrained.

The old man shook his head again and went on. 'They've eaten his bread and done his work; and—and—don't you call it, Mr Austin—I ask you plain—don't you call it black ingratitude?'

'I am sure it is. I have no doubt whatever about the ingratitude. But, you see, Checkley, that vice is not one which the Courts recognise. It is not one denounced in the Decalogue.—There is a good deal to consider, in fact, before we get to the ingratitude. It is probably a criminal conspiracy: it is a felony: it is a thing to be punished by a long term of penal servitude. When we have worried through all this and got our conspirators under lock and key, we will proceed to consider their ingratitude. There is also the bad form of it and the absence of proper feeling of it; and the want of consideration of the trouble they give. Patience! We shall have to consider the business from your point of view presently.'

'I wouldn't scoff and snigger at it, Mr Austin, if I were you. Scoffin' and sniggin' might bring bad luck. Because, you know, there's others besides yourself determined to bring this thing to a right issue.'

George put down his papers and looked at this importunate person. What did he mean? The old man shrunk and shrivelled and grew small. He trembled all over. But he remained standing with his hands on the table—leaning forward. 'Eight years ago,' he went on, 'when that other business happened—when Mr Arundel cut his lucky'—

'I will have nothing said against Mr Arundel. Go to your own room.'

'One word—I will speak it. If he's dead, I shall not stay long here. But I shall stay so long as he's alive, though you are his partner. Only one word, sir. If Mr Arundel hadn't—run away—he'd a been a partner instead of you.'

'Well?'

'Well, sir—s'pose he'd been found out *after* he was made a partner, instead of before?'

George pointed to the door. The old man seemed off his head—was it with terror? Checkley obeyed. But at the door he turned his head and grinned. Quite a theatrical grin. It expressed malignity and the pleasure of anticipation. What was the matter with the old man? Surely, terror. Who, in the office, except him—

* Copyright 1892 in the United States of America by Harper & Brothers.

self, had the control of the letters? Who drew that quarterly cheque? Surely, terror.

It was not until half-past eleven that Mr Dering arrived at the office. He usually passed through the clerks' office outside his own: this morning he entered by his own private door, which opened on the stairs. No one had the key except himself. He generally proceeded in an orderly and methodical manner to hang up his hat and coat, take off his gloves, to place his umbrella in the stand, throw open the safe, sit down in his chair, adjusted at a certain distance of three inches or so, to put on his glasses, and then, without either haste or dawdling, to begin the work of the day. It is very certain that to approach work always in exactly the same way saves the nerves. The unmethodical workman gets to his office at a varying hour, travels by different routes—now on an omnibus, now on foot; does nothing to-day in the same way that he did it yesterday. He breaks up early. At sixty he talks of retiring: at seventy he is past his work.

This morning, Mr Dering did nothing in its proper order. First, he was nearly two hours late. Next, he came in by his private door. George rose to greet him, but stopped because—a most wonderful thing—his Partner made as if he did not observe his presence. His eyes went through George in creepy and ghostly fashion. The junior partner stood still, silent, in bewilderment. Saw one ever the like, that a man should at noontide walk in his sleep! His appearance, too, was strange; his hat, pushed a little back, gave a touch of recklessness—actually recklessness—to the austere old lawyer: his eyes glowed pleasantly; and on his face—that grave and sober face—there was a pleased and satisfied smile: he looked happy, interested, benevolent, but not—no—not Mr Edward Dering. Again, his coat, always tightly buttoned, was now hanging loose; outside, it had been swinging in the breeze, to the wonder of Lincoln's Inn: and he wore no gloves, a thing most remarkable. He looked about the room, nodded his head, and shut the door behind him.

'He's somnambulating,' George murmured, 'or else I am invisible: I must have eaten fern-seed without knowing it.'

Mr Dering, still smiling pleasantly, walked across the room to the safe and unlocked it. He had in his hand a brown paper parcel tied with red tape—this he deposited in the safe, locked it up, and dropped the keys in his pocket. The window beside the safe was open. He sat down, looking out into the Square.

At this moment Checkley opened the door softly, after his wont, to bring in more letters. He stopped short, seeing his master thus seated, head in hand, at the window. He recognised the symptoms of yesterday—the rapt look, the open eyes that saw nothing. He crept on tiptoe across the room. 'Hush!' he whispered. 'Don't move. Don't speak. He went like this yesterday. Don't make the least noise. He'll come round presently.'

'What is it?'

'Kind of fit, it is. Trouble done it. Yah! Ingratitood.' He would have hissed the word, but it has no sibilant. You can't hiss without the materials. 'Yesterday's trouble. That's what's done it.'

They stood watching in silence for about ten minutes. The office was like the Court of the sleeping Princess. Then Checkley sneezed. Mr Dering probably mistook the sneeze for a kiss, for he closed his eyes for a moment, opened them again, and arose once more himself, grave and austere.

He nodded cheerfully, took off his hat, hung it on its peg, buttoned his coat, and threw open the safe. Evidently he remembered nothing of what had just passed.

'You are early, George,' he said. 'You are before me, which is unusual. However—the early bird—we know.'

'Before you for once. Are you quite well this morning? None the worse for yesterday's trouble?'

'He's always well,' said Checkley, with cheerfulness assumed. 'Nobody ever sees him ill—he get ill? Not him. Eats as hearty as five-and-twenty, and walks as upright.'

'I am perfectly well, to the best of my knowledge. Yesterday's business upset me for the time—but it did not keep me awake. Yet it is certainly a very great trouble. You have no news, I suppose, that brought you here earlier than usual?'

'Nothing new since yesterday.'

'And you feel pretty confident?'

'I feel like a sleuth-hound. I understand the pleasures of the chase. I long to be on the scent again. As for Edmund Gray, he is as good as in prison already.'

'Good. I was for the moment shaken out of myself. I was bewildered. I was unable to look at the facts of the case calmly. For the first time in my life I wanted advice. Well: I now understand what a great thing it is that our profession exists for the assistance of men in trouble. How would the world get along at all without solicitors?'

He took his usual place at the table and turned over his letters. 'This morning,' he went on, 'I feel more assured: my mind is clear again. I can talk about the case. Now then. Let us see—Edmund Gray is no shadow, but a man. He has made me recommend him to his landlord. He is a clever man and a bold man. Don't be in a hurry about putting your hands upon him. Complete your case before you strike. But make no delay.'

'There shall be none. And you shall hear everything from day to day, or from hour to hour.'

Left alone, Mr Dering returned to his papers and his work.

At half-past one, Checkley looked in. 'Not going to take lunch this morning?'

'Lunch? I have only just'—Mr Dering looked at his watch. 'Bless me! Most extraordinary! This morning has slipped away. I thought I had only just sat down. It seems not more than half an hour since Mr Austin left me. Why, I should have forgotten all about it and let the time go by—nothing worse for a man of my years than irregular feeding.'

'It's lucky you've got me,' said his clerk. 'Half-a-dozen partners wouldn't look after your meal-times—Ah!' as his master went up-stairs to the room where he always had his luncheon laid out, 'he's clean forgotten. Some of these

days, walking about wropped up in his thoughts, he'll be run over.—Clean forgotten it, he has. Sits down in a dream: walks about in a dream: some of these days he'll do something in a dream. Then there will be trouble.' He closed the door and returned to his own desk, where he was alone, the juniors having gone out to dinner. His own dinner was in his coat pocket. It consisted of a saveloy cut in thin slices and laid in bread with butter and mustard—a tasty meal. He slowly devoured the whole to the last crumb. Then, Mr Dering having by this time finished his lunch and descended again, Checkley went up-stairs and finished the pint of claret, of which his master had taken one glass. 'It's sour stuff,' he said. 'It don't behave as wine in a man's inside ought to behave. It don't make him a bit joyfuller. But it's pleasant too. Why they can't drink Port wine—which is real wine—when they can afford it, I don't know.'

It was past three in the afternoon when George returned, not quite so confident in his bearing, yet full of news.

'If you are quite ready to listen,' he said, 'I've got a good deal to tell. First of all, I thought I would have another shot at Gray's Inn. I went to the Chambers. The outer door was open, which looked as if the man was at home. I knocked at the inner door, which was opened by the laundress, the old woman whom I saw yesterday. "Well, sir," she said, "you are unlucky. The master has been here this very morning. And he hasn't been long gone. You've only missed him by half an hour or so." I asked her if he would return that day; but she knew nothing. Then I asked her if she would let me write and leave a note for him. To this she consented, rather unwillingly. I went in, therefore, and wrote my note at Mr Gray's table. I asked him to call here on important business, and I marked the note "Urgent." I think there can be no harm in that. Then I looked about the room. It is one of those old wainscoted rooms, furnished simply, but everything solid and good—a long table, nearly as large as this one of yours: solid chairs—a solid sofa. Three or four pictures on the wall, and a bookcase full of books. No signs of occupation: no letters: no flowers. Everything covered with dust, although the old woman was there. I could have wished to examine the papers on the table, but the presence of the old woman forbade that dishonourable act. I did, however, look at the books. And I made a most curious discovery. Mr Edmund Gray is a Socialist. All his books are on Socialism: they are in French, German, and English: all books of Socialism. And the pictures on the wall are portraits of distinguished Socialists. Isn't that wonderful? Did one ever hear before of Socialism and forgery going together?'

'Not too fast. We haven't yet connected Edmund Gray with the forgery. At present, we only know that his name was used.'

'Wait a bit. I am coming to that. After leaving the chambers, I went into the City and saw Mr Ellis. First of all, none of the stock has been sold.'

'Oh! they have had three months, and they have not disposed of it? They must have met with unforeseen difficulties. Let me see.'

Mr Dering was now thoroughly alert. The

weakness of the morning had completely passed away. 'What difficulties? Upon my word I cannot understand that there could have been any. They have got the papers from a respectable solicitor through a respectable broker. No—no. Their course was perfectly plain. But rogues often break down through their inability to see the strength of their own case.'

'Next, Mr Ellis has ascertained that some of the dividends are received by your Bank. I therefore called on the manager. Now, be prepared for another surprise.'

'Another forgery?'

'Yes—another forgery. It is nine or ten years since you sent a letter to the manager—I saw it—introducing your client Edmund Gray, gentleman, who was desirous of opening a private account. He paid in a small sum of money, which has been lying to his credit ever since, and has not been touched. In February last he received another letter from you: and again in March and April, forwarding certificates, and requesting him to receive the dividends. With your own hand you placed the papers in the Bank. I saw the letters. I would swear to your handwriting.'

'These people are as clever as they are audacious.'

'At every point a letter from you—a letter which the ablest expert would tell was your handwriting. Your name covers and vouches for everything.'

'Did you tell the manager what has happened?'

'Certainly; I told him everything. And this is in substance the line he takes. "Your Partner," he says, "alleges that those papers have been procured by forgery. He says that the letter of introduction is a forgery. Very good. It may be so. But I have opened this account for a customer who brought me an introduction from the best solicitor in London, whose handwriting I know well, and recognise in the letter. Such an allegation would not be enough in itself for me to take action: until a civil or criminal action is brought—until it is concluded—I could not refuse to treat the customer like all the rest. At the same time I will take what steps I can to inquire into my customer's antecedents."'

'Quite right,' said Mr Dering.

'I asked him next, what he would do if the customer sent for the papers. He said that if an action were brought, he would probably be served with a *sub poena duces tecum*, making him keep and produce these papers as forming part of the documents in the case.'

'Certainly, certainly; the manager knows his law.'

'"And," he went on, "as regards cheques, I shall pay them or receive them until restrained."'

'In other words, he said what we expected. For our own action now.'

'We might apply to a judge in Chambers for an attachment or a garnisher order. That must be *pendente lite*, an interlocutory proceeding, in the action. As yet, we have not brought an action at all. My partner—Mr Dering rubbed his hands cheerfully—'I think we have done very well so far. These are clumsy scoundrels, after all. They thought to divert suspicion by using my name. They thought to cover themselves

with my name. But they should have sold and realised without the least delay. Very good. We have now got our hands upon the papers. It would have complicated matters horribly had the stock been sold and transferred. So far we are safe. Because, you see, after what they have heard, the Bank would certainly not give them up without letting us know. They would warn us: they would put the man off: they would ask him awkward questions about himself. Oh! I think we are safe—quite safe.'

Mr Dering drew a long breath. 'I was thinking all night,' he continued, 'of the trouble we might have if those certificates had changed hands. They might have been bought and sold a dozen times in four months: they might have been sold in separate small lots, and an order of the Court necessary for every transaction. We have now nothing but the simple question before us: how did the man Edmund Gray get possession of this property?'

He sat in silence for a few minutes. Then he went on quietly. 'To lose this money would be a heavy blow for me—not all my fortune, nor a quarter, but a large sum. I have plenty left. I have no hungry and expectant heirs: my people are all wealthy. But yet a very heavy loss. And then—to be robbed. I have always wondered why we left off hanging robbers. They ought to be hanged, every one. He who invades the sacred right of property should be killed—killed without hope of mercy.' He spoke with the earnestness of sincerity. 'To lose this property would not be ruin to me; yet it would be terrible. It would take so many years out of my past life. Every year means so much money saved. Forty thousand pounds means ten years of my past—not taken away so that I should be ten years younger, but, ten years of work annihilated. Could I forgive the man who would so injure me? Never.'

'I understand,' said George. 'Fortunately, we shall get the papers back. The fact of their possession must connect the possessor with the fraud. Who is he? Can he be warned already? Yet who should tell him? Who knows that we have discovered the business? You—your friend Mr Ellis—the Manager of the Bank—no one else. Yes—there is also Checkley—Checkley,' he repeated. He could not—yet—express his suspicions as to the old and faithful servant. 'Checkley also knows.'

At this point Checkley himself opened the door and brought in a card—that of the Bank Manager.

'I have called,' said the visitor hurriedly, 'to tell you of something important, that happened this morning. I did not know it when we were talking over this business, Mr Austin. It happened at ten o'clock as soon as the doors were open. A letter was brought by hand from Mr Dering—'

'Another forgery! When will they stop?'

'—asking for those certificates to be given to the bearer—Mr Edmund Gray's certificates. This was done. They are no longer at the Bank.'

'Oh! Then they have been warned,' cried George. 'Who was the messenger?'

'He was a boy. Looked like an office boy.'

'I will inquire directly if it was one of our boys. Go on.'

'That settles the difficulty as to our action in case the papers are wanted by you. We no longer hold them. As to the dividends, we shall continue to receive them to the account of Mr Edmund Gray until we get an order or an injunction.'

'The difficulty,' said George, 'is to connect the case with Mr Edmund Gray bodily. At present, we have nothing but the letters to go upon. Suppose the real Edmund Gray says that he knows nothing about it. What are we to do? You remember receiving the dividends for him. Has he drawn a cheque?'

'No; we have never paid any cheque at all for him.'

'Have you seen him?'

'No; I have never seen him.'

'It is a most wonderful puzzle. After all, the withdrawal of the papers can only mean a resolution to sell them. He must instruct somebody. He must appear in the matter.'

'He may instruct somebody as he instructed me—in the name of Mr Dering.'

'Another forgery.'

'Yes,' said George. 'We must watch and find out this mysterious Edmund Gray. After all, it will not help us to say that a forged letter gave certain instructions to do certain things for a certain person—say the Queen—unless you can establish the complicity of that person. And that—so far—we certainly have not done. Meanwhile—what next?'

Obviously, the next thing was to find out if any of the office boys had taken that letter to the Bank. No one had been sent on that errand.

MOUNTAIN OBSERVATORIES.

IF any one of my readers has ever, as is probable, made the now fashionable ascent of Mont Blanc, I should like to ask him how long he stayed at the summit, and whether he could submit to a sojourn there of longer or shorter continuance. This inquiry is made not as an idle question, for the mere amusement to be derived from hearing the answer, but as a matter for practical and serious consideration—for somebody soon will have to reside there—in connection with a project launched by M. Janssen in the admirable *Notice Scientifique*, on which what follows is entirely based.

The progress of science at the present day, he holds, brings us face to face with divers orders of questions in astronomy, in celestial physics, in meteorology, and even in the domain of biological investigation, which can only be resolved by the intervention of lofty stations of observation. The history of discoveries made since Saussure's time on elevated table-lands or mountains is a more than sufficient demonstration of the fact, and its truth is now admitted by every eminent man who has studied the question. As for M. Janssen himself, his conviction has been formed long ago—founded as it has been on repeated experience in various and distant points of the globe—that our atmosphere is a great obstacle to accurate

observation, and that lofty stations offer great advantages.

The globe we inhabit, which serves as our purveyor as well as our dwelling-place, is surrounded by a fluid envelope, composed of gases, vapours, solid and liquid dust, and germs of different natures. The phenomena of which it is the theatre are connected with its composing elements, and with its relations to the solid and liquid surface of the globe it surrounds. The succession of these phenomena forms a cycle whose effect is to maintain in their integrity the conditions indispensable to the manifestation and the maintenance of life; and the harmony of this combination ought to be an eternal subject of study, thought, and admiration.

But the atmosphere is not only the principal factor in the maintenance of life on earth, it is also that which confers on it its great charm and its poetry. What, in fact, would be our sojourn here without the admirable blue vault which covers us, without clouds floating through it, without twilights, dawns, and sunsets, whose lovely effects are all due to the presence of the atmosphere? Without the atmosphere—to suppose an impossibility—were the earth still habitable, it would offer but a sorry residence. Thus the atmosphere admirably fulfils the two grand objects of supporting life and of giving it a charm; and it is wonderful that such different ends should be attained by such simple methods.

As regards the astronomer who is also a natural philosopher, we have only to consider the atmosphere in respect to the disturbance and the modifications it causes in the observations he is endeavouring to make. In the first place, it refracts the rays which reach us from the stars; that is, it makes them deviate from their true direction, giving to those stars an apparent place the further removed from their real position the nearer they are to the horizon.

But above all, the atmosphere diffuses light; in such a way that a luminous ray which traverses it illuminates a more or less considerable portion of it, thus introducing light which spreads itself in all directions where it is not wanted. It is by this diffusion of light that the atmosphere gives us the spectacle of a blue celestial vault overhead. It is also this diffusion and this illumination of the atmosphere, especially in the neighbourhood of the heavenly bodies, which offer the greatest obstacle to observations. Moreover, the atmosphere absorbs a considerable proportion of the light which comes both from the sun and from the stars. And not only does it absorb a very notable part of these radiations, but it does not absorb their component elements in equal measure. It modifies their very nature; the result being that we cannot be sure of the composition of those radiations when they reach us at the surface of the earth, as we might do if we received them before they entered our atmosphere. Consequently, the obstacles with which the astronomer and the physicist have to contend at the very outset are, an alteration of the true positions of the stars, an illumination which weakens and confines our powers of vision, and an absorption of radiations with a change in their component rays.

M. Janssen takes as an instance the daily movement of the sun in the heavens, from its highest

point in the sky until its setting. Suppose we are at a spot between the tropics where the sun is at the zenith at noon. There, the disc is beheld in its true place; but the action of the atmosphere is not the less felt in other respects. Although, if it be homogeneous and calm, it alters neither the apparent place nor the shape of the sun, still it makes the sun's colour appear considerably more yellow than it ought to be. But, as the sun descends towards the west, changes in its appearance become more and more pronounced. The disc will be seen in a position higher than its real position, and the lower the sun sinks, the greater will be the divergence. At the same time, the roundness of the image will be altered, the disc showing a tendency to flatten. Its vertical diameter is shortened, whilst its horizontal diameter remains sensibly the same. Besides which, the disc, hitherto yellowish white, but bright, becomes not only less luminous, but deeper in hue; first orange, then red, and finally blood red, in northern climates. At that stage, the distance between the sun we behold and the real sun is so decided, that the one is completely below the horizon while we still have before our eyes the flattened, ruddy, and deformed figure of its image. And what thus occurs with respect to the sun must evidently happen to the other heavenly bodies. The constellations, for instance, are in like manner disfigured in their form and in the colour of their constituent stars.

If the atmosphere is a hindrance to general astronomy, it is a serious obstacle to physical astronomy. Take, once more, as an example, the sun, whose constitution, as we know it at present—it is not so long ago that it was surmised to be habitable—is quite a recent conquest of science, made within the last thirty years through the agency of the spectroscope. Now, one of the properties of the spectroscope is to liberate us in certain cases from the effects of atmospheric illumination. Our ideas at present of what the sun is will demonstrate the impulse which lofty stations are likely to give to astronomical studies.

The sun consists of a globe formed, in a general way, of the materials of the system of which it is the centre and the regulator. This globe, especially in its interior, is heated to temperatures which we cannot guess at, but which must be excessively high. Its luminous surface is formed by incandescent vapours in which float little clouds—the granulations—whose true form has been revealed by photography, as well as the unity of constitution in all the parts of the solar surface—which surface shows the well-known spots that, for two centuries and a half, have furnished the basis of all discussions and speculations concerning the constitution of the sun. Such is the sun as seen through telescopes.

At present, above this luminous surface we find a first gaseous or vaporous envelope, some two thousand leagues thick—very little for the sun—and consequently demanding special care in its study. The certainty of its existence was shown by the spectroscope, although a glimpse of it had often been obtained during total eclipses. Above the chromosphere—as the gaseous stratum is called—are found fiery protuberances shooting outwards, whose nature and daily movements are also displayed by the spectroscope. All these

phenomena are enveloped and as it were bathed in an immense and final covering of rarefied gases, whose colossal dimensions are evidenced by solar occultations. During eclipses, this solar atmosphere produces a most magnificent spectacle and confers on the phenomenon all its splendour. It is composed of hydrogen gas and other bodies still unknown. Its object, doubtless, is to separate the incandescent globe from cold empty space, which would cool it too rapidly. There are also swarms of meteorites which circulate round the sun, and the zodiacal light, whose precise cause is unknown.

Of all this, the earth's atmosphere prevents our seeing more than the luminous globe bounded by the photosphere—that is, the central nucleus. The existence of all the rest has been unveiled by total eclipses, but could only have been studied and comprehended by the intervention of the spectroscopic.

An observer who beheld the sun at the limits of our atmosphere would see, without resorting to any artifice, the globe in its complete and entire magnificence—its superincumbent atmospheres, its flaming appendages, its immense luminous corona—that is, he would see the sun in all its glory. And fortunately, to enjoy a near approach to that spectacle, it is found that there is no need to climb to extraordinary altitudes. A moderate elevation is ascertained to yield a notable amelioration in astronomical observations.

As evidence of the service to be expected from observatories stationed on lofty altitudes, M. Janssen cites the results obtained during the eclipse of 1868, which inaugurated the spectroscopic study of the circumpolar regions of the sky, and excited great emulation in the astronomical world. The eclipse of 1871 induced several observers to combine the altitude of the station with the favourable circumstances of the occultation. Mr C. A. Young observed the eclipse on Mount Sherman, at an altitude of 8300 feet, and reported that stars of the seventh magnitude were visible by the naked eye. The spectral lines of the chromosphere were three times more numerous there than on the plain. He thence concludes that powerful instruments, placed on elevated positions, would enable science to make an advance which, otherwise, would take scores of years to accomplish.

While Mr Young was on Mount Sherman, a French mission was observing at Schoolor, on the Neilgherries, and was enabled thereby to definitely demonstrate the reality of that last solar envelope which has been mentioned as the sun's 'coronal atmosphere,' and which separates the solar globe from starry space. We have thus two important discoveries made on elevated stations.

A very favourable eclipse occurred in 1878, observable in North America. The observers took up successive positions, one after the other—to which they were obliged by the line of the eclipse—on lofty stations. Messieurs Eartman and Pritchett observed at Las Animas, Colorado, at 3976 feet. They were astonished by the clearness of the sky. No twinkling at the zenith; the Milky Way outlined in wonderful detail; Jupiter's satellites visible by the naked eye. This last possibility had been so little foreseen,

that Jules Verne thought it, and meant it for, fun, when he made one of his personages, an extra-capable serving-man, able to see the said satellites without the help of a telescope. Now that their visibility, unaided by a spyglass, is an established fact, one is strongly tempted to go and personally verify the experiment.

At Jaho Spring, 7800 feet, the satellites of Jupiter were continually seen by the naked eye, even with the moon above the horizon. The Milky Way assumed the aspect of chains of hills covered with snow, having dark intervening spaces, whose existence was afterwards confirmed. Mr Holden and his assistants observed at Central City, Colorado, at 9013 feet. They recorded the extraordinary intensity of the corona, which they attributed to the altitude of the station. Mr Langley selected Pike's Peak, at an elevation of 14,100 feet. All the outlines were of surprising distinctness, and the sky, quite close to the sun—a criterion—remained blue.

Mr Asaph Hall, the discoverer of Mars's satellites, took up his position at La Junta, Colorado, 4187 feet; sky extraordinarily transparent; a great number of stars visible by the naked eye; the Milky Way shining with marvellous distinctness. 'It is quite time,' said Mr Hall, 'to profit by the advantages offered by lofty stations, and to resolve this question, which is of capital importance.'

But before these eclipse observations, elevated altitudes had already been utilised for special researches. In 1856 and 1857, Piazzi Smith went to the Peak of Tenerife to study the solar spectrum, and was highly satisfied with the success of his visit. In 1868 and 1869, M. Janssen ascended the Himalayas, after his expedition to the coast of Coromandel to observe the eclipse of the 18th of August 1868. So convinced was he of the advantages of lofty stations that he passed the whole winter there. The very pure and very dry atmosphere of those elevated regions allowed him to search for the presence of watery vapour in the planets and the stars without being incommoded by the presence of that vapour in the atmosphere. At Simla, during the first half of the winter 1868-69, the air was of such excessive dryness as frequently to give singular signs of electrification. The paper on which he wrote his notes emitted sparks on a simple touch. He saw no reptiles there and very few insects, though the former might then be hibernating. The mutton brought them by the mountaineers would keep for an indefinite length of time. The unused pieces simply got dry, preserving all the while a healthy pink hue. The atmosphere was perfumed by the balsamic odours exhaled by the surrounding cedar forests.

At night, the Himalayan sky displayed such treasures that time did not suffice for him to make all the observations to which they invited him. First, there was the mighty Sirius, whose bluish light was extraordinarily brilliant, revealing by the gaps in its spectrum the enormous atmosphere of hydrogen by which it is surrounded and, doubtless, also the rapid rotation of its immense globe. Then there was Arcturus, whose ruddy light seemed to indicate a sun in a stage of declining vigour. Then there was the admirable constellation of Orion—one of the first to fix the attention of men—whose stars seem to

resume amongst themselves all the phases of solar life, just as its beautiful nebula, the largest in the sky, presents us with their genesis. Finally, there were our planets, whose light he interrogated respecting their watery elements and their atmospheres; and of whom we must inquire, by proceedings which M. Janssen, unfortunately, has only had time to begin, both their geological age and the mystery of the forms of life which exist hidden on their surface. And so, as lofty stations are now the grand desideratum, preparations, begun last August, have already been made for building an observatory on the top of Mont Blanc; and built it certainly will be. M. Janssen, and M. Eiffel, who assists him in the enterprise, are not men to do things by halves. The first step is to hit upon a rocky foundation; but hitherto nothing has been found firmer than snow more and more compressed by the weight of successive layers. Samples of this snow have been put aside, to ascertain what solid particles or mineral dust they contain. A vessel filled with snow from the summit is found to hold about half the bulk when melted. Galleries in search of rock have been quarried in the snow. Their acoustic qualities are peculiar. The voice rapidly ceases to be audible. The workmen—who continued in good health—could scarcely hear each other speak at the distance of sixty feet. The summit of Mont Blanc is not exactly a point or a peak, but a very narrow ridge in the direction from north to south; but very long, on the contrary, from east to west. But whatever the difficulties, the thing will be done. A building will be erected, with double-walled dormitories and under-snow storehouses, very habitable, M. Janssen says, and for which he expects to succeed in finding scientific occupants.

A BOYCOTTED BABY.

CHAPTER III.—JEM'S BABY.

MATTHEW BULBOUS was thankful when the daylight came at last on that Christmas morning. He rose at once, and wandered restlessly about the rooms below until breakfast. In spite of his vigorous common-sense, the affair of the previous night left a most uneasy impression on his mind. Not that he troubled himself as to what it really was—he knew this well enough; but he could not shake off a superstitious fear as to what it meant. More than once he went into the study and regarded thoughtfully the spot on which the visitor stood. His memory was usually excellent in even small matters, but it disturbed and annoyed him excessively to find that by no effort could he recollect where he had seen that face before. The strangest fact was his recognition of the face on this occasion without being able to see it.

'At anyrate,' he reflected, 'the thing was an imposture. It was not Jem's wife, who was quite another sort of female. But where did I see this one before?'

It was no use vexing himself with the effort to remember. After breakfast, while he was impatiently wishing it were four o'clock, an idea struck him of going privately to Jem's wife's funeral. It would help to pass the time, and

it would also be satisfying. He announced this Christian resolution to his wife, by way of set-off to his uncharitable feelings of the day before, and left home. But he did not know the address, and much as he would have wished to see the funeral without even his brother's knowledge, Joseph was the only person from whom he could get the address. When he arrived at Chelsea, however, the landlady said Mr Joseph Bulbous was not at home. Interrogated further, she said he had particularly mentioned that he was going out to Penge to a funeral, the funeral of his nephew's wife, and that he was not coming back until late in the evening. The information was satisfactory, in so far as it confirmed the fact that there was no deception about Jem's wife being really dead. Matthew Bulbous straightway drove to Victoria Station and took a train to Penge, where he arrived in thirty minutes.

Finding a four-wheeled cab at the station, he inquired of the driver if the cemetery was far off—there was a funeral going there which he wanted to meet. The driver knew all about the cemetery, and he also knew of a funeral for which a friend's equipage had been chartered—the name was Bulbous, and they would pass the house. Matthew got into the cab. After driving down the main street of Penge, they turned to the right up Croydon Road, and he observed with a feeling of reassurance a hearse and two mourning coaches standing before one of the small villas which fringed the road.

On the top of the hill there is an inn, where another road crosses Croydon Road at right angles, and from this spot the cemetery was visible on rising ground about half a mile off. Matthew thought this would be a good point to obtain a view of the funeral as it passed, as he could conceal himself in the bar of the inn. He detained the cab, therefore, and went into the house.

Presently the funeral came by. The hearse was an honest hearse with glass panels, admitting of no deception as to a coffin being inside. Next the hearse came the principal mourning coach, whose occupants he scanned narrowly, but with a nervous start which attracted the curiosity of the barkeeper. First, he recognised his son, with a band on his hat; but beside him sat a lady heavily veiled in crape—the same person, if identity between substance and shadow were possible, who had visited Matthew Bulbous the night before! Her face was so thickly veiled as to be undiscernible to an ordinary eye; but Matthew Bulbous's recognition of it was undoubted and startling.

For some minutes he was dazed; but the purpose for which he came was still unconsciously active, and he followed the funeral at a distance in the cab. He was able in due time to see, from a safe place, the coffin lowered into the grave and the earth shovelled in upon it. Then he drove to another station, and got back to Blackheath by train.

He was glad to have been able to witness the burial without the knowledge of his brother, and he told his wife that, being unable to find the address, he had not left London. Joseph, therefore, would be left in the dark. But he did not suspect that, in passing the public-house, Joseph, who sat in the second coach, had glanced

into the bar as an object of interest, and had detected his brother's face through the door.

At four o'clock Joseph Bulbous arrived, and after paying his respects to the ladies, went to the study and remarked that it was all over.

'All over, is it?' said Matthew carelessly, putting down the newspaper he had been reading. 'I thought of going myself, after all, and actually went to Chelsea. But you were gone, and I didn't know the address.'

'So you came home again? Well, now I remember it, I never did give you Jem's address—you never asked me. However, it doesn't matter, I suppose?'

'Not in the least,' said Matthew.

Now, as the reader knows, there were two points on which Matthew Bulbous was particularly anxious to obtain information—namely, the identity of the lady who sat with his son in the first carriage, and whether there was a baby. As to the first, his lips were sealed, for he would not divulge either the visit he had received the previous night, or the fact that he had been at the funeral. But on the second point he was not left long without information.

'I suppose,' said Matthew after a pause, 'Jem is not much cut up on account of her death?'

'Well, no, Matt,' was the solemn reply; 'he couldn't very well be cut up. He did his duty by her, better than most men would have done—better than she deserved. It must be a relief to him, though he doesn't say a word.'

'What does he intend doing?'

'I don't think he has any plans yet. If you are inclined to overlook the past, the best thing to do would be to let him go abroad for a while—not very long—and by the time he returned he would have got over everything.'

It was the very thing Matthew wanted, but he was not going to say so. He therefore took some minutes to think over it before he answered.

'If he wishes to go away for a bit—and to have the past overlooked,' he said, measuring out his words slowly and with emphasis, 'you may tell him I will supply him with all the money he requires. But it will be on two conditions—first, that he leaves England at once; and second, that he holds no communication with his mother or any one else until he returns. If he agrees to these, you may come to my office the day after to-morrow and I will give you the money for him.'

'Very well. I think he will agree. Then, about the baby?—'

'What! there's a baby, then?' he exclaimed, with an angry start. He was more than angry—he was indignant. What was the good of the woman dying if she left the luckless marriage perpetuated by a child? Yes, there was a baby, Joseph said in a pathetic voice; a pitiful little thing, just such as might be expected from such a mother—sickly, puny, and ill-formed.

'It will be a mercy if it dies,' Joseph observed; 'but it isn't likely to die. Things of that sort die hard.'

Matthew Bulbous rose and paced rapidly up and down. He was powerfully moved over this matter. Again and again, he indignantly exclaimed in his angry thoughts that the woman might as well not have died at all. But there was one thing clear. The baby must go!—it

must leave his path—it was a fact with which no compromise could be contemplated.

Did Joseph Bulbous, sitting there silent and apparently abstracted, suspect what was passing in his brother's thoughts? Possibly he did, for he was the only person who knew Matthew down to the sole of his feet—knew him, indeed, better than the elder brother knew himself.

'You wouldn't care, Matt, I suppose,' he remarked thoughtfully, 'for your wife to know about this baby? Women have such unaccountable ways where babies are concerned, you never know what they'll do. You wouldn't care, I suppose,' Joseph observed mildly, 'to have the child in your own house?'

For an instant Matthew glared savagely at the mere suggestion, with the blood hot in his face. 'Look here!' he exclaimed, with suppressed anger, 'it would be ill for my wife, or for any woman of our family, to oppose me in this—ill for her and hers. I'll have none of it! You understand me? I hope Jem has not written to any of them about the child? If he has, you had better, for their own sakes, let them know what I say.'

'He has not done so. Nobody knows anything about the child. But what do you intend to do with it?'

This required thought. There was one thing clear to Matthew Bulbous—he must depend on his brother to help him out of this grave embarrassment. There was no one who could accomplish it better, if he had the will; and, notwithstanding the past, there was no one else on whose fidelity he could so fully rely. But it would be necessary to confide in his brother if his agency were to be secured in this emergency.

'What do I intend to do with it?' Matthew repeated. 'You must help me in this matter, Joe; it is the last service I shall ask of you, and I shall not forget it when you are going. Now I'll tell you exactly how it stands.'

He related what had passed between him and Lord Polonius, and of course Joseph Bulbous saw the situation at once. There was a silence of several minutes. Then Matthew spoke again, but all he said was the monosyllable: 'Well?'

There are many ways of pronouncing this short word, and the way in which Matthew Bulbous uttered it now caused his brother to draw a deep breath and slightly raise his shoulders.

'What I have said to Lord Polonius, Joe, must be made true, in fact. The Thing is not worth being in the way of a less important business. I don't care how it's done or what it costs, so long as it is done safely. You understand me now?'

'Very well,' replied the other. 'I am acquainted with a—private institution, which makes a specialty of that line of business. I'll see what I can do.'

On the next day but one Joseph Bulbous called at the office. James Bulbous had accepted his father's proposal, and was ready to start for the continent that afternoon. Matthew gave his brother a roll of bank-notes for the purpose; and then the latter reported the gratifying intelligence that he had arranged an interview for Matthew with the Lady Principal of the institution which he had referred to. Matthew made a grimace, as though he would prefer to decline

a personal meeting; and suggested the arrangement being entirely carried out by Joseph himself.

'That's impossible,' replied the latter. 'The lady is a lady of high standing in her profession, like yourself, and will only negotiate with principals.'

On being assured that Jem had not communicated in any way with his mother—whose knowledge of the baby's existence, gentle as she was, Matthew felt would have been unfavourable to his business—he reluctantly agreed to attend at his brother's lodging at seven o'clock.

He felt far from comfortable as he drove to Chelsea in the evening. The consciousness that he was taking a principal part in putting an end to a life that stood in his way, made itself very troublesome in a breast which was naturally cowardly. Matthew had, while keeping well outside of the law, taken a hand in shady proceedings before now in order to make money; but he had never been concerned in so hazardous a matter as this. Not that his moral sense was touched—it was the risk he was thinking of; the infant's life itself was as nothing to him in comparison with the advantages to be gained by putting an end to it.

As he stepped out of the cab, he rallied himself with the reflection that this kind of thing was done every day—was, in a sense, legitimised for want of evidence to hunt it down when done by careful professional hands.

At his request Joseph went out as the lady came in, for it was a business not requiring a witness. Matthew glanced at her curiously. She wore a reassuring aspect of 'business' in her countenance, looking straight at him with an expression in her steady eye and well-set mouth—the latter encircled by a growth of resolute bristles—which indicated strength of character. Mrs Griffon proceeded to business without delay. She understood that Mr B.—it was her professional practice to mention names by initials—wished to entrust to her care an infant whose father had gone abroad, its mother being deceased. She also understood that the baby was delicate, and hardly—all right. Mr Bulbous regretfully implied that this was so. Then Mrs Griffon uttered a sympathetic 'Ah!' and pointed out how them was the objects as lived when other babies died—that such was her experience; that they seemed to live on their misery, and generally did credit to their keep. Of course for the care of such a baby as that, requiring extra attention and et ceteras, terms was necessarily higher than ordinary; likewise, as we never know what may happen, there was doctor and funeral expenses to be considered. The result of the negotiations was the payment to Mrs Griffon (in cash) of fifty pounds, provisionally; at the end of three weeks, should further arrangements be necessary, a small sum would be paid weekly for the child's maintenance. This sum would be so small that it would obviously not be the interest of Mrs Griffon to look forward to it.

Regular reports came to Matthew Bulbous, by request. No parent was ever more anxious. In three days he learned that, after all, the baby's vitality did not seem so tenacious since its mother's death. Mothers, as Mrs Griffon ex-

plained, contrived to keep such things alive when all the attention and science of an experienced nurse failed to do so, which was one of those strange facts no one was capable of explaining. Consequently, though far from desiring to alarm Mr Bulbous, Mrs Griffon felt it her duty to prepare him for what might happen in the course of nature.

Joseph Bulbous came to the office one morning at the end of a week. 'The doctor,' he stated gravely, 'says it is impossible to keep the child alive—he has tried all his skill.'

'Oh, he has, has he?' Matthew observed.

'Yes. Radical disease from birth—called it some hard name which I forget.—Mrs Griffon,' he added, 'wanted to leave town in a couple of days, to pay a visit to a dear friend who is ill; but she can't leave the baby in that critical condition.'

'Hasn't she some one to take her place?' demanded Matthew.

'Yes, of course there is the—the staff,' replied Joseph, wiping some moisture from the corner of one of his eyes. 'But, professionally, she feels bound to be in at the—I mean, to be on the spot on such important occasions. However, the doctor says it is very likely she will be able to go.'

Matthew Bulbous drew a deep breath. He would give a thousand pounds for the whole thing to be over. He could not command an easy moment until it was past and safely buried in oblivion.

'Joe,' he said, 'telegraph to me immediately—your understand? And I would like to know the nature of the disease. Ask the doctor to send me a report, and I will pay him for it.'

Within two hours the report arrived by a messenger who was instructed to 'wait answer.' The report was scientific and satisfactory, and Matthew Bulbous wrote out a cheque for five guineas and sent it to the doctor.

Sending a cheque was not a prudent act, as he recollected after it was gone. The doctor, he was aware, or he suspected, was a confederate of Mrs Griffon, and if anything went wrong, the cheque might be awkward evidence of Matthew Bulbous's relations with the parties. He had been careful to pay Mrs Griffon in cash and without a witness. Now that it was too late, he was annoyed on account of the cheque, much more so than another man would have been, for Matthew Bulbous was in the habit of carefully considering minor details in connection with important transactions.

The hour of his deliverance was nearer than he expected, but it came accompanied by a fresh circumstance of great vexation. At nine o'clock that evening he had a telegram—from his brother, of course, though it was not signed—in the following terms: 'Child died at seven o'clock. Will be buried to-morrow.'

Joseph Bulbous had had large experience in framing telegrams in terms intelligible only to the receiver. Was he drunk when sending this, not to remember that it was a case specially calling for careful phraseology? Matthew was excessively vexed, and took some time to cool down sufficiently to realise the full import of the news. He felt puzzled and disappointed. It was curious that the receipt of this momentous

message, so anxiously awaited, failed to produce on his mind the effect for which he had prepared himself. The death of the unhappy infant meant everything to his ambition, removed the one obstacle from his path, making all smooth to him. Yet he was not elated; he hardly felt satisfied; and almost began to get angry against his own unreasonableness; and although he knew it was illogical and absurd, he felt a secret anxiety which he could no more root out of his breast than he could now—if he so wished it—call back the spark of life into the baby's miserable little body.

Nobody, except his wife, knew that Matthew Bulbous did not go to bed that night. He could not rest. Hour after hour he grew still more restless and anxious, till the dawn of a day of wrath fell on his shrinking face through the study window.

A MILITIA 'TRAINING.'

THOUGH the Militia of the United Kingdom has undergone some rather sweeping changes within recent times, it continues to represent the 'constitutional' defensive force which has existed—with a few blanks and many modifications—almost from the Anglo-Saxon period. It was reorganised at the Restoration on a basis which, as to its main features, may perhaps be said still to subsist. A few years ago, however, the authorities decided to style the militia battalions as additional ones to those of the infantry of the line. The method of officering the force, too, has been amended. But probably the most notable change to the eyes of the ordinary observer has been the assimilation of the uniform to that of the 'regulars'; and above all, the substitution of their gold lace and gilt buttons for the time-honoured silver, or white, lace and buttons so long the distinguishing mark of the militia.

The great event of the militia year is the annual 'training.' It lasts a month, and during that not very long period, a surprising amount of military instruction is imparted to the members of a battalion. For two months previous to this general training, the recruits collected since the previous one are called in and drilled; and when the main body is mustered, they are able to take their places in the ranks, if not exactly as 'trained soldiers,' at least with a fair knowledge of such elementary exercises as, for example, the curious one well known as the 'goose step.'

What may be considered as the typical kind of training usually takes place 'under canvas'—that is to say, the men occupy a temporary encampment during its progress. They are apprised of the date of assembly by means of placards posted in public situations, such as the entrances to parish churches; and these notices set forth, among other things, the 'advantages' of service in the militia, one of the principal attractions held out being a 'bounty' payable at the conclusion of the month's drill. The 'muster parade' is advertised to occur at mid-day, and those who fail to appear there forfeit a day's pay; for the military day commences, not after the stroke of midnight, but after that of twelve noon.

Though nominally understood to be held at mid-day, the drums do not commonly beat for muster parade till a little later. During this interval, an observer looking into the precincts of the camp might be surprised at the doings of some hundreds of men, who have gathered in the vicinity of a tent pitched apart from the ordinary 'lines' of canvas dwellings. They are some of them engaged in divesting themselves of part of their clothing; others are drawn up in 'single rank' with their shirt sleeves turned up as far as that operation can well be carried, while boots and stockings have been removed, and nether garments rolled up above the knee. In other words, they stand bare-legged and bare-armed. After a little they are seen to march in this semi-clad condition into the tent above alluded to; then, with hardly any delay, to issue from it and resume possession of the piles of boots and clothing with which the grass in the neighbourhood is sprinkled. The spectator of this peculiar scene, if of an inquiring nature, might perhaps be tempted to approach and peep in at the tent 'door,' were it not for the somewhat austere demeanour of a sentinel standing near by. This man, of course, is one of the recently drilled recruits, and, like the proverbial broom, may be expected to carry out his function with exactness. Even if he should waive interference with an intruder, however, there is nothing so very extraordinary or mysterious in the tent. At a table sits the medical officer, with company rolls before him. As each bare-legged man comes in he (the man) says 'Fit,' or, in a few instances, 'Unfit'—meaning fit for duty, or not fit from illness, as the case may be. In the former event the surgeon promptly writes 'Fit' opposite the man's name on the list; in the latter, the complainant is detained for subsequent examination.

Before long comes the muster parade, which is but a roll-call, and is quickly over. Soon afterwards the men are seen proceeding by companies to a permanent edifice of wood or stone, the interior of which is fitted up with a vast number of small compartments, something like the berths in a ship. This is the store; and here each man, on giving his 'kit number,' is handed a large canvas bag, that for the past eleven months has found a resting-place, along with a variety of equipments, in one of the above-mentioned compartments. The bag contains a complete outfit of uniform clothing and 'necessaries'—such as, for instance, a knife, fork, and box of shoe-blackening. Having retired to a convenient spot, the recipient of the bag clothes himself in uniform, and then he returns it, filled with his own private garments—which are not invariably of a fashionable character—to its appropriate compartment, there to remain undisturbed till the end of the 'training.'

Henceforth, most of the militiaman's time is occupied with drill, at least during the day. This commences with the rudiments of a soldier's instruction as exemplified in the goose step, and in these curious motions familiarly known as 'fly-catching,' which are said to be viewed with astonishment by continental visitors to our shores. Later on, more ambitious exercises and movements are entered upon in a creditable manner. As already hinted, the officering of

the force has been modified: the adjutant, for instance, is now selected from the officers of the regular regiment to which the militia is attached as a third or fourth battalion. From that regiment, too, come all the principal non-commissioned officers. Thus every company has one or more experienced sergeants from the 'regulars'; and it may be said with perfect truth that these men form the backbone of the whole militia system. Under an officer known as the musketry instructor, assisted by a certificated sergeant instructor, the companies are 'put through'—what is now almost the most important item of a soldier's education—a course of rifle-shooting.

A few days after the camp has been got into working order, at a certain hour on a fine sunny morning, the inhabitants of each tent may be seen drawn up in front in single rank. In a central position stand the adjutant and sergeant-major; and the latter may be heard, in somewhat truculent tones, giving instructions to the groups of men. Suddenly he makes a sign to a bugler, who is standing hard by in the constrained attitude of 'attention.' Forthwith the boy sounds a prolonged 'G' on his instrument; and in a moment the men fly to the ropes of the bell tents, while an important functionary termed the 'front-rank poleman' rushes into each and seizes the central pole. Then the sergeant-major makes another sign, which quickly draws forth a second 'G' from the bugle. Almost before the sound of this has died away, the tents have fallen with a dull thud upon the ground, and the polemen may be seen struggling, in a diverting manner, to extricate themselves from the canvas in which they are for the moment enveloped. An extraordinary scene of activity supervenes. In a shorter time than it takes to state the fact, the tents with their ropes, pegs, and everything have been packed into the bags provided for this purpose; and supposing the men ready accoutred, the battalion could march away with its impedimenta almost immediately.

Two or three hours later, the lines of tents rise again, as if by magic, to the sound of the bugle; the polemen lapsing into comparative obscurity till the camp is once more 'struck.' During the month, some of the tents, particularly in wet or windy weather, show a good deal of eccentricity, and it is by no means an unknown experience for the inmates to be rudely awakened in the night by the overflow of the 'ditch,' or even the total overthrow of the canvas structure by the wind.

At length the end of the 'training' comes round. On the morning of the day of disbandment, rifles and equipments are returned to the store; while the bags are brought out of the berth-like compartments, and the men resume the garb of everyday life. Then the battalion 'falls in' at an appointed hour. At this parade the pay-sergeants—who, of course, belong to the permanent staff—appear wearing haversacks. Having called the roll for the last time, they take from the haversacks a quantity of envelopes, each bearing a man's name, and apparently containing some weighty substance. As the name on the envelope is called out by the sergeant, its owner advances, takes possession, and retires to the ranks, where he may be seen to carefully count the coins which constitute his 'bounty.' (Some-

times, we understand, the men are not paid until they are in the railway carriages on the way from the dépôt.) Very soon the commanding officer dismisses the battalion; and next day the only relics of the 'training' are the circles in the grass that mark the situation of the now filled up tent 'ditches.'

HOME LETTERS.

'THE mail-steamer has passed Cape Borda,' says somebody, looking over the paper at breakfast-time.

'When will she be in?'

Another look at the paper and a little calculation soon satisfies us that 'she' will be off the semaphore by mid-day.

'Suppose we go and see the mails landed,' suggests somebody else.

Carried unanimously.

A line of low sandhills, on which stands the front row of houses at the semaphore, the rest of the little town being out of sight behind them, a long stretch of sandy beach, from which two jetties, about a mile apart, run out into the sea like long black arms, are the chief features of that part of South Australia first seen by a new arrival. But these things are too familiar to us to call for comment, as, at the appointed time, we take our way along the esplanade towards Largs Bay, where the mails are landed. We have soon passed the last of the semaphore houses; and looking to the right over the low rush-grown sandhills, and beyond the clump of masts and chimneys that marks the Port, can see the Mount Lofty range rising soft and blue in the distance. Below us, on the left, lies the sea, with the steamer close in now—a black blot on its brightness, that grows larger every minute. She is nearly at the anchorage, where two fussy little steam launches are bobbing up and down, as if impatient for their load of letter-bags. We must hurry.

Our destination is soon reached; and passing the Pier Hotel with its cool-looking balconies, we make the best of our way along the jetty. Here, near the end, a train is waiting, while a group of men stand ready to land the mails. We find a place which commands a view of the landing-stage, and sit down to await events.

The first boat from the steamer brings passengers and luggage; but the one with the mails follows hard behind. There are meetings and greetings on the landing-stage and on the jetty, a hurried examination of luggage on the part of the Customs officials; and these first arrivals hurry away with their friends. By this time, two or three active men in the second launch are hard at work throwing out the bags, while another gang carries them up to the train. An engine goes off with the first few trucks as soon as they are filled, and another will come soon for the next. Back and forth pant the little launches; up and down the sloping stage go the men, carrying sacks, on which, in staring capitals of brilliant hue, is printed the name of their destination. We try to count them, but soon give it up, for the launches come in two at a time now, and the men work faster. The last sack is tossed into its place; the official in charge climbs into the train; the men straighten their backs, an engine

comes rumbling along the jetty and rumbles off again with its precious charge. The mail is landed, and home letters will soon be spread all over the colonies. Adelaide letters will be delivered this afternoon; those for Melbourne will reach their destination to-morrow if they catch the afternoon express; and Sydney will get hers next day.

Some letters will have to travel for weeks before they arrive at the up-country post-office or far-away run to which they are directed; but the farther they go the warmer their welcome; and the man who goes for them will be well repaid for his long ride, though he may have had to swim his horse across a river, or even to camp out a night on the way, by the joy called up by the mention of English letters in the half-peeled face of some homesick new chum, who is rapidly losing his fresh complexion and romantic notions of bush-life under the influence of sunshine and unpoetic realities; or the well-tanned one of a man who has been long enough out to be used to life and work, and quite at home in the colony, yet has not forgotten the old country—Home, as we always call it here.

Even the knock-about hand who is known to have seen better days—being, in fact, one of those ne'er-dowells so often shipped off to our shores—brightens up at the mention of home letters. Who knows what he is expecting—news that he has come into a fortune, or maybe a title as well? Such things do happen in this topsyturvy land of ours. Or maybe he is just hoping against hope that some friend, some member of the family which has cast him off, perhaps deservedly, has relented enough to send a few kind words. There is nothing for him. He did not really think there would be; but his hard face grows harder and his bitter thoughts more bitter as he turns away. He may be a thorough scamp, beyond any one's power to reclaim; yet who knows? The knowledge that somebody cared whether he lived or died; whether he was struggling to recover lost ground or drifting from bad to worse, would at least have done no harm.

By-and-by, a tired stockman or boundary-rider comes in after his long day's work, jogging slowly homewards, weary in body and mind. But the mention of home letters puts new life into him; he hastily swallows his evening meal, and then—perhaps by the humble illumination of a bush-lamp—a tin of fat with a bit of rag for wick—he reads and rereads his precious missives.

Home letters! What magic there is in those two words; they call up a hundred scenes, of which this is only one. The modern magic of steam and electricity has so annihilated time and space that we sometimes feel as if we were 'within cooe' of the old country; but it is a far cry after all, and though our letters bear a recent date, they speak of a very different world. It is perhaps difficult to write regularly to people at a distance, where difference of surroundings may seem to entail lack of common interest; but the time has gone by when long voyages added to the difficulty, when, as Charles Lamb says, writing to Australia was 'like writing for posterity,' when news became history in the transit. It no longer requires two prophets to carry on a correspondence satisfactorily; and it is surely worth while

to write a few kindly home-breathing words when they will be so precious, so very precious to friends across the sea.

While we have been thinking, other onlookers have drifted away. The Customs officers have shut themselves into an office so like an up-ended packing-case that one fancies they are doing penance therein for the disarrangement they inflict on neatly packed portmanteaus. The old tart-seller who is always on hand on mail-days with his basket, his dog, and his bronzed good-natured face, has departed, seeing no further prospect of trade in confectionery, and the jetty is deserted save by ourselves and a few patient but dejected-looking fishermen; so we turn our steps homewards, and are soon discussing, over a welcome cup of tea, what the mail will bring for us.

SOME CURIOSITIES OF EPITAPH LITERATURE.

In an article on this subject which appeared in these pages a few years ago (No. 54, January 10, 1885), many instances were given of the epitaphs common before clergymen began to exercise supervision over the churchyards of their parishes. Most of the epitaphs quoted set at defiance every canon of orthography, grammar, and metre, not to speak of the decency which one expects to find in such places; and the writer referred with satisfaction to the vast improvement which has taken place since the beginning of the century. This improvement, among other reasons, may explain the fact that, as far as this country is concerned, there is little that is new to be written on the subject; and such of the inscriptions given below as are native productions are merely inserted as a supplement to the previous paper. Those from the other side of the Atlantic, bearing as they do many characteristic marks of their origin, may be read with more interest. But all, British or foreign, are such curiosities of this kind of literature, that no apology is needed for bringing them before the public.

During the whole of last century, epitaph-making seems to have been the special and favourite vocation of doggerel-mongers, and doubtless it was so as far back as people had the small amount of education necessary to compose such lines as the following, which, according to a newspaper of 1838, were then to be seen at Liverpool:

This humble stone is raised to JULIAN TREE,
Who in 1776 died in direst poverty:
Unloved by daughter, wife, or friend,
He went his way unto the end.—R.I.P.

In the same place was another, shorter and more pithy, and expressing a truism which is too well known to be worth commemoration in distich-form, but which, perhaps for that very reason, was in special demand with the epitaph-makers of the last century:

In Memory of JAMES BROWN.
'All men must die,' and so did he
Who lies beneath—in 1703.

The inscription on one Samuel Hearne and his wife is told in smoother verse—if it can be digni-

fied by any such name—but its tone is much the same as the above. It runs :

SAMUEL HEARNE, a man was he,
Who lived through youth and age to be
Full ninety years of age and more,
Before he died in 1804.
His wife survived him many a day,
In '21 being called away;
And now they here together rest
And moulder into silent dust.

In contrast to the long life of Samuel Hearne was that of Mary Thompson, buried in a London churchyard, whose pathetic story is told by her epitaph :

Here buried lies in Mother Earth
The mortal shell of one
Who wished before her life's decay
That it was nearly done,
And so she faded right away
Without Disease's 'Ay' or 'Nay.'

More tragic was the fate of Thomas Ramage of Hull, who died, presumably of hydrophobia, in 1824.

'Let sleeping dogs lie' is a proverb that's true,
As he who lies under has cause to tell you,
For he woke one that slept, who bit him in rage,
And he died of his wound, did THOMAS RAMAGE.

In a graveyard in another part of Yorkshire may be read an inscription of a different kind, but one in which the sentiment, though heard often enough even at the present day, is rather ambiguous and enigmatical :

Under this tablet rests in peace
A man, JOHN JENKINS JONES,
Whose death to him was a release—
Also to Widow Jones,
Who now to him erects this stone,
In mem'ry that she's left alone.

Upon another member of the great Jones family, who may or may not have been a relation of the John Jenkins above mentioned, the following lines are said to stand as an epitaph, but the locality is unknown to us :

Here lies old EBENEZER JONES,
Who all his life collected bones,
Till Death, that grim and bony spectre,
That all-amassing bone-collector,
Boned old Jones, so neat and tidy,
That here he lies, all *bond fide*.

Much of the same character is a glowing eulogium upon a Dublin lawyer of the name of Alexander Gray, who was apparently a *rara avis* of a legal practitioner, if we are to trust the common belief that honest lawyers are as few and far between as the proverbial angels' visits. He died in 1798, and his epitaph said :

Of ALEX. GRAY
Let no man say
That he was either black or gray ;
For though his life
Was spent in strife,
It was as open as the day.
In all his ways
White as the Grays,
He lived an honest lawyer.

Another epitaph of the same kind, punning upon the name of the deceased, is that on the great-grandfather of John Wesley—John White, a celebrated Puritan lawyer, and one of the members of Parliament actively opposed to Charles I. Clarendon says of him : 'He was a

grave lawyer, but notoriously disaffected to the Church.' According to Tyerman, in his *Life of Samuel Wesley*, he died on the 29th of January 1644, and was buried in the Temple Church, where a marble stone was afterwards placed upon his grave, with this inscription :

Here lyeth a John, a burning, shining light,
His name, life, actions, were all WHITE.

Sharing with the above the weighty association of history is the epitaph upon John Hatfield, the Keswick impostor, well known in connection with the Buttermere Mary mentioned by Wordsworth in his *Prelude*. The story of Hatfield's crimes and punishment is too long to be told here, and may not, besides, be unknown to our readers. He was executed at Carlisle and buried in St Mary's Churchyard there, where the following epitaph may still, for all that we know to the contrary, be read on his tombstone :

Our life is but a winter's day :
Some only breakfast and away ;
Others to dinner stay,
And are full fed ;

The oldest man but sups and goes to bed.
Large is his debt who fingers out his day ;
He who goes soonest has the least to pay.

The same epitaph is also to be seen in Stirling Churchyard, but it is impossible to say which of them is the original.

Of inscriptions which have never really served as such we have a good instance in the story of a potter and an itinerant musician, who, meeting at a country inn and discussing epitaphs, proposed that each should furnish one for the other. The musician, after some deliberation, produced the following for the potter :

On earth he oft turned clay to delf,
But now he's turned to clay himself.

The potter followed suit with this for the musician :

In beating time his life was passed,
But time has beaten him at last.

Like these, as far as its purpose is foreign to that for which epitaphs are generally supposed to be written, is the one which, according to a New York paper, is to be seen in an American graveyard :

Here will lie MR JAMES JONES ; at present he lives and carries on his shoe business at 150 Franklin Street.

Somewhat similar, and even more distinctively transatlantic, is our next, for the authenticity of which, however, we do not vouch :

This stone is erected to the memory of THOMAS LAING, who died on July 13, 1880, by his son Ulysses G. Laing, who now carries on his business with the same public-spirited enterprise at the Bonanza Cyclopean Stores, Bond Street ; see advertisements in the daily papers.

This reminds us of a Parisian inscription which, freely translated, runs :

To the everlasting Memory of MARIE FERRY.

The railing around this grave is the handiwork of her bereaved husband, Pierre Ferry, Blacksmith, who will execute all orders of a similar nature with cheapness and despatch.

A slight confusion of meaning is discernible in another inscription, bearing a scriptural text, which may be seen in the cemetery at Peshawur, India. It is only charitable to suppose that it

was drawn up by others than the deceased's professional brethren :

Sacred to the Memory of the Rev. ———, Missionary, murdered by his *chokidar*.—'Well done, thou good and faithful servant.'

Scarcely less malapropos is the oft-quoted epitaph on husband and wife :

Here lies the body of JAMES ROBINSON and RUTH, his wife.—'Their warfare is accomplished.'

And in a sequestered Californian burial-ground, far from the haunts of men, a stone was recently discovered, bearing the simple explanation :

To SAMUEL CONSTABLE.

'After life's scarlet fever, he sleeps well.'

Probably unique in its way is the epitaph of George H. Churchill, in that it is that of a suicide, composed by himself. He ended his life by taking poison at San Francisco a few years ago—his reasons for taking the fatal step being ill-health and inability to work. In a letter to the coroner he said : 'It takes money to live, and it requires work to get money ; and I am unable to work, too proud to beg, and not smart enough to steal. I am absolutely compelled by the unfortunate circumstances in which I am placed to end a life which has become a burden to me.' Appended was the epitaph which he wished placed upon his tombstone :

Here unfortunate CHURCHILL lies ;
Nobody laughs, nobody cries ;
Where he's gone, how he fares,
Nobody knows, nobody cares.

The neighbouring State of Oregon contains an epitaph of a slightly different character from that of Churchill's, to an unnamed person with the sobriquet of 'Whisky Jim,' who had died there in the early days of its settlement. It is such as one would hardly expect to find in the Western society of those days, and is as follows :

In the green shades of which the poets sing,
When this old world has had its earthly fling,
You'll find the spirit, if *you're* there, of him,
To whom this stone is raised—we called him WHISKY JIM.

He died in 1853.

Further east, close to one of the prairie telegraph stations of the Pacific Railway, but apparently placed there years before the making of that road, is a stone bearing an inscription of more pretension than the above. It is evidently the work of a man of some education, and probably, judging from the way in which it is turned, an Englishman. It says :

Stranger ! when passing, pause you here,
The rough and ready grave of FRIER,
The best and bravest, first and last,
Of pioneers of Yankee caste,
Who came, 'tis said, from far-off Maine,
And passed away without pain.
An honest man ; could read and write ;
Knew how to get both sup and bite
By trapping, farming, building, or
Teaching the youths his learned lore ;
Could handle gun like a frontier man,
And hit his mark as only such can ;
And now that you his virtues know,
We only add that he lies below.

The following on Lem. S. Frame commemorates the same qualities :

To LEM. S. FRAME, who during his life shot eighty-nine Indians, whom the Lord delivered into his hands,

and who was looking forward to making up his hundred before the end of the year, when he fell asleep in Jesus at his house at Hook's Ferry, March 27, 1843. He was married thrice, and had fifteen sons and daughters, all of whom are now alive. After the strifes and cares of this world, may he rest in peace !

Even more remarkable are other two epitaphs of the same kind, the first of which is said to be upon a tombstone in the city of Sacramento :

Here is laid DANIEL BORROW, who was born in Sorrow, and Borrowed little from Nature except his name and his love to mankind and hatred to redskins ; who was nevertheless a gentleman and a dead shot ; who, through a long life, never killed his man except in self-defence or by accident ; and who, when he at last went under, beneath the bullets of his cowardly enemies in the saloon of Jeff Morris, did so in the sure and certain hope of a glorious and everlasting Morrow.

The other, which belongs to a Nevada burying-place, is such a noteworthy achievement in this line that it may fitly conclude our compilation of a few of the curiosities of epitaph literature :

Sacred to the Memory of HANK MONK—the Whitest, Biggest-hearted, and Best-known Stage-driver of the West ; who was kind to All and Thought ill of None. He Lived in a Strange Era, and was a Hero ; and the Wheels of his Coach are now Ringing on Golden Streets.

N A M E L E S S.

THERE is no name, no mark, no sign,
To tell who lies below
The tall rank grass, where daisies shine
And pale primroses blow ;
Yet mournfully the lindens wave
And sunbeams gently play,
As if within that nameless grave
An exiled monarch lay.

No monarch sleeps a whit more sound
In dim cathedral aisles
Than this poor heart in earth's green bound
Beneath the sun's glad smiles.
Though it may be that alien earth
Entombs his lifeless clay,
Far from the land that gave him birth,
He rests in peace to-day.

Did friends around his death-bed watch
And wait his latest sigh,
With parted lips, as if to catch
His ling'ring fond good-bye ?
Or did he die an outcast lone,
With none to pray or weep,
With none to hear his dying moan
Or close his eyes in sleep ?

Did death come to him as a friend
That brings repose and peace,
And bliss that ne'er shall know an end,
And joy that will not cease ?
We only know he sleeps below
The daisies and the grass,
Where, ever tenderly and slow,
The lingering sunbeams pass.

'STRANGERS IN A STRANGE LAND.'

THE native of India has become a familiar object in the streets of the metropolis. He is no longer, as formerly, the cynosure of every eye; and indeed—unless, perchance, he be wearing his native dress—is as likely as not to be passed by unnoticed. After all, we may be inclined to ask, what are a few Indians more or less among London's huge population, including as it does representatives of well-nigh every nationality? But the native of India can hardly be considered in the same light as the swarthy Boohoo Islander, or the last importation from Topsy-turvy Land, though both be equally familiar. He differs from these last in being our fellow-subject, and accordingly he is, or should be, more closely connected with us.

'The possession of India,' says a recent writer, 'has added a new and clearly-defined element to English life.' His reference was solely to the Anglo-Indian; but it might well have been extended to include the real as well as the adopted children of the gorgeous East.

Indians in England fall broadly into three divisions. First, those who have come over purely for amusement, much as Englishmen now visit India in the cold season. These are mere birds of passage. Second, business men, chiefly merchants, who import Indian produce for sale in this country, and have establishments here and in India. Third—and this is by far the largest and, to our mind most interesting class—students. That there are a very considerable number of Indians residing here for purposes of education is a fact perhaps not generally known. The majority are engaged in working for the Bar examinations or the Indian Civil Service; but there are others qualifying for their doctor's degree, and indeed for almost every profession. And what a strange life is theirs! a life which to an English lad would be intolerable—a life of all work and no play, such as we have been led to believe makes Jack a dull boy. Doubtless, however, the constitution of the young Indian

is not the same as that of the subject of the old lines. For to the Indian student the English public school is, save in a few exceptional cases, a *terra incognita*. The crammer's establishment does duty for his Eton; his playing-fields are Kensington Gardens and Hyde Park. The best years of his life are passed in some dismal lodging in a Bayswater back street, far from home and relatives, occasionally with others of his countrymen as fellow-lodgers, more frequently in dreary solitude. His pleasures are few. Work from morn to night at his tutor's, preparation for next day's tasks in the evening, leave him but little time he can call his own. A stray visit to a theatre or music hall is his only dissipation; for, though his needs are small, his purse is but slender.

These strangers' powers of application are astonishing. Of original genius they may be devoid; but for work which requires of the mind imitation rather than creation they are pre-eminently adapted. The essential difference between whist and chess, both games of skill, has been held to lie in the fact, that while the latter, to be successful, must proceed strictly in accordance with a definite system, which admits not the smallest deviation, the whist-player's greatest triumphs are won by some bold *coup* which throws all rules to the winds, so that it is hardly a paradox to say that to play whist well is to play in spite of rules. If this be so—and it is not an absolutely untenable theory—then the native of India should be a capital chess-player, but a bad partner for a rubber. Of him, if of any one, it may be said, that he can obey, not command. After all, perhaps, he possesses the more important qualification.

We hear much nowadays of the influx of Germans and other foreigners, whose competition ousts Englishmen from the labour market, inasmuch as the foreigner will not only, owing to his lower standard of living, be satisfied with a smaller wage, but is also a better workman. But it is not unreasonable to suppose that the competition of our Indian fellow-subject will ere long

be a far more serious element in our social system. His standard of living is lower even than that of the foreigners we now complain of; his industrial efficiency will, with the extension of Indian education, be far greater.

Of society, even if he can find time for it, the Indian student has little. Between him and his native fellow-students is a great gulf fixed, that 'most blighting of all human institutions, caste,' whose potent influence even some thousand miles of sea cannot wholly destroy. True, there are exceptions to the rule. Happy the Indian whom a kindly *kismet* permits to reside at either university. There the line of caste distinction is less firmly drawn.

But if he knows but little of those around him of his own race, he knows even less of his English fellow-students. As the Jews had no dealing with the Samaritans, so there is seldom any degree of intimacy between East and West at their common tutor's, though for weeks together they sit side by side on the same form. Your friend Jones's son is at Fillem and Swallow's, the great Indian crammers, imbibing what may be not inaptly termed a *judicious* mixture, which may qualify him to hold the scales between some thousands of denizens of Her Gracious Majesty's Eastern Empire. But ask Jones Junior if he knows So-and-so, and he will elevate his aristocratic eyebrows, much as if you had suggested that he was not unacquainted with the interior of Dartmoor prison. You repeat the question; and you will be told: 'Oh, one of those Indians, you mean. I have seen him about at the "shop"'—the shop being Messrs Fillem and Swallow's establishment—'but we don't have anything to do with *them*.' The amount of contempt thrown into that little word '*them*' is incredible; it chokes you; and yet Jones' Junior's grandfather was once a shopboy, while your Indian friend draws his blood straight from the Moguls.

It is not quite so bad with the fair sex. 'He has such beautiful eyes,' said an English girl the other day, when remonstrated with for flirting with 'that Indian.' So there is some power still in *les beaux yeux*.

But though familiar to the *blasé* Londoner, there is one class to whom the Indian, such as we have described, is a never-failing novelty. The country cousin, up for a week's sight-seeing, seldom omits to turn and gaze at this, to him, strange species of the genus British subject. And can we say that his attention is ill bestowed? Is there not a peculiar signification in this latest object lesson? May not the sight of these Indians in Fleet Street, this mingling of East and West, afford as much room for reflection as a visit to the Tower or a climb to the top of the Monument? Each points a moral. The Monument and the Tower are, so to speak, pictures in the great volume of English history. They remind us inevitably of the past; the sight of them awakes a hundred slumbering reminiscences of time gone by.

But the sight of these Indians is even more suggestive. It suggests the Past, for their mere presence in our midst illustrates the difference

between the nineteenth and all previous centuries; it suggests the Future, for it makes us wonder what will be that social system of which they must one day form an integral part.

THE IVORY GATE.*

BY WALTER BESANT.

CHAPTER XV.—CHECKLEY'S CASE.

THAT evening Mr Checkley was not in his customary place at the *Salutation*, where his presence was greatly desired. He arrived late, when it wanted only a quarter to eleven. The faded barrister was left alone in the room, lingering over the day's paper with his empty glass beside him. Mr Checkley entered with an air of triumph, and something like the elastic spring of a victor in his aged step. He called Robert, and ordered at his own expense, for himself, a costly drink—a compound of Jamaica rum, hot water, sugar and lemon, although it was an evening in July and, for the time of year, almost pleasantly warm. Nor did he stop here, for with the manner of a man who just for once—to mark a joyful occasion—plunges, he rattled his money in his pocket and ordered another for the barrister. 'For,' he said, 'this evening I have done a good work, and I will mark the day.'

When the glasses were brought, he lifted his and cried: 'Come, let us drink to the confusion of all Rogues, great and small. Down with 'em!'

'Your toast, Mr Checkley,' replied the barrister, 'would make my profession useless: if there were no rogues, there would be no Law. That, however, would injure me less than many of my brethren. I drink, therefore, confusion to Rogues, great and small. Down with 'em.—This is excellent grog.—Down with 'em!'

So saying, he finished his glass and departed to his garret, where, thanks to the grog, he slept nobly, and dreamed that he was a Master in Chancery.

The reason of this unaccustomed mirth was as follows: Checkley by this time had fully established in his own mind the conclusion that the prime mover in the deed—the act—the Thing—was none other than the new partner, the young upstart, whom he hated with a hatred unextinguishable. He was as certain about him as he had been certain about Athelstan Arundel, and for much the same reasons. Very well. As yet he had not dared to speak: King Pharaoh's chief scribe would have had the same hesitation at proffering any theory concerning Joseph. To-night, however—But you shall hear.

Everybody was out of the office at half-past seven, when he left it. He walked round the empty rooms, looking into unlocked drawers—one knows not what he expected to find. He looked into Mr Austin's room and shook his fist and grinned at the empty chair.

'I'll have you yet,' he said. 'Oh, fox! fox! I'll have you, if I wait for thirty years!'

It adds an additional pang to old age when one feels that if the end comes prematurely, when one is only ninety or so, there may be a revenge unfinished. I have always envied the dying

hero who had no enemies to forgive because he had killed them all.

When Checkley left the place he walked across the Inn and so into Chancery Lane, where he crossed over and entered Gray's Inn by the Holborn archway. He lingered in South Square: he walked all round it twice: he read the names on the door-posts, keeping all the time an eye on No. 22. Presently, he was rewarded. A figure which he knew, tall and well proportioned, head flung back, walked into the Inn and made straight for No. 22. It was none other than Athelstan Arundel. The old man crept into the entrance, where he was partly hidden; he could see across the Square, himself unseen. Athelstan walked into the house and up the stairs: the place was quiet: Checkley could hear his steps on the wooden stairs: he heard him knock at a door—he heard the door open and the voices of men talking.

'Ah!' said Checkley, 'now we've got 'em!'

Well—but this was not all. For presently there came into the Inn young Austin himself.

'Oh!' said Checkley, finishing his sentence—'on toast. Here's the other; here they are—both.'

In fact, George, too, entered the house known as No. 22 and walked up the stairs.

Checkley waited for no more. He ran out of the Inn and he called a cab.

If he had waited a little longer, he would have seen the new partner come out of the house and walk away: if he had followed him up the stairs, he would have seen him knocking at the closed outer door of Mr Edmund Gray. If he had knocked at the door opposite, he would have found Mr Athelstan Arundel in the room with his own acquaintance, Mr Freddy Carstone, the Cambridge scholar and the ornament of their circle at the *Salutation*. But being in a hurry, he jumped to a conclusion and called a cab.

He drove to Palace Gardens, where Sir Samuel had his town-house. Sir Samuel was still at dinner. He sat down in the hall, meekly waiting. After a while the Service condescended to ask if he wished a message to be taken in to Sir Samuel.

'From his brother's—from Mr Dering's office, please tell him. From his brother's office—on most important business—most important—say.'

Sir Samuel received him kindly, made him sit down, and gave him a glass of wine. 'Now,' he said, 'tell me what it all means. My brother has had a robbery—papers and certificates and things—of course they are stopped. He won't lose anything. But it is a great nuisance, this kind of thing.'

'He has already lost four months' dividends—four months, sir, on thirty-eight thousand pounds. And do you really think that he will get back his papers?'

'Certainly—or others. They are, after all, only vouchers.—How is my brother?'

'Well, Sir Samuel, better than you'd think likely. This morning, to be sure'—He stopped, being loth to tell how his master had lost consciousness. 'Well, sir, I've been thinking that the property was gone, and from what I know of them as had to do with the job, I thought there was mighty little chance of

getting it back. It kept me awake. Oh! it's an awful sum. Close upon forty thousand pounds. He can stand that and double that'—

'And double that again,' said Sir Samuel. 'I should hope so.'

'Certainly, sir. But it's a blow—I can feel for him. I'm only a clerk; but I've saved a bit and put out a bit, Sir Samuel. Cheese-parings, you'd say; but I've enjoyed saving it up—oh! I've enjoyed it. I don't think there is any pleasure in life like saving up—watching it grow—and grow and grow—it grows like a pretty flower, doesn't it?—and adding to it. Ah!' he sighed, and drank his glass of wine. 'Sir Samuel, if I was to lose my little savings, it would break my heart. I'm an old man, and so is he—it would break me up, it would indeed. Ever since yesterday morning, I've been thinking whether anything could happen to make me lose my money. There's Death in the thought. Sir Samuel—for an old man—and a small man—like me—there's Death in the thought.'

'Don't tell anybody where your investments are, and lock up the papers, Checkley.—Now, what do you want me to do for you?'

'I want you to listen to me for half an hour, Sir Samuel, and to give me your advice, for the business is too much for me.'

'Go on, then. I am listening.'

'Very well. Now, sir, I don't know if I shall be able to make my case clear—but I will try. I haven't been about Mr Dering for fifty years for nothing, I hope. The case is this. Nine years ago, a man calling himself Edmund Gray took Chambers in South Square, Gray's Inn—forty pounds a year. He is represented as being an elderly man. He has paid his rent regularly, but he visits his Chambers at irregular intervals. Eight years ago there was a forgery at your brother's. The cheque was payable to the order of Edmund Gray; mark that. The money was paid'—

'I remember. Athelstan Arundel was accused, or suspected of the thing.'

'He was. And he ran away to avoid being arrested. Remember that. And he's never been heard of since. Well, the series of forgeries by which the shares and stocks belonging to Mr Dering have been stolen are all written in the same handwriting as the first, and are all carried on in the name and for the order of Edmund Gray. That you would acknowledge in a moment if you saw the papers: there are the same lines and curves of the letters'—

'Which proves, I should say, that Athelstan never did it.'

'Wait a minute. Don't let's be in a hurry. The forgers by themselves could do nothing. They wanted some one in the office, some one always about the place: some one who could get at the safe: some one who could get from the office what the man outside wanted, some one to intercept the letters'—

'Well?'

'That person, Sir Samuel, I have found.'

Sir Samuel sat up. 'You have found him?'

'I have. And here's my difficulty. Because, Sir Samuel, he is your brother's new partner; and unless we lodge him in the Jug before many days, he will be your own brother-in-law.'

Sir Samuel changed colour, and got up to see

that the door behind the screen was shut. 'This is a very serious thing to say, Checkley—a very serious thing.'

'Oh! I will make it quite plain. First, as to opportunities; next, as to motives; third, as to facts. For opportunities, then. Latterly, for the last six months, he's been working in the Chief's office nearly all day long. There he sat, at the little table between the windows, just half turned round to catch the light, with the open safe within easy reach of his hand when the Chief wasn't looking; or when—because he doesn't always touch the bell—Mr Dering would bring papers into my office and leave him alone—ah! alone—with the safe. That's for opportunities. Now for motives. He's been engaged for two years, I understand, to a young lady'—

'To Lady Dering's sister.'

'Just so, sir. And I believe, until the unexpected luck of his partnership against the wish of Lady Dering's family.'

'That is true.'

'He had two hundred a year. And he had nothing else—no prospects and no chances. So I think you will acknowledge that there's sufficient motive here for him to try anything.'

'Well, if poverty is a motive—no doubt he had one.'

'Poverty was the motive. You couldn't have a stronger motive. There isn't in the whole world a stronger motive—though, I admit, some young men who are pore may keep honest. I did. Mr Austin, I take it, is one of those that don't keep honest. That's for motive. Now for facts. Mr Austin had nothing to do with the forgery eight years ago; he was only an article clerk beginning. But he knew young Arundel who did the thing, remember. That cheque was written by young Arundel, who ran away. The letters of this year are written by the same hand—by your brother-in-law, Sir Samuel, by Mr Athelstan Arundel.'

'But he is gone; he has disappeared: nobody knows where he is.'

Checkley laughed. This was a moment of triumph. 'He is back again, Sir Samuel. I have seen him.'

'Where? Athelstan back again?'

'I will tell you. All these forgeries use the name of Edmund Gray of 22 South Square, Gray's Inn. I have told you that before. When the thing is discovered, young Austin goes off and makes himself mighty busy tracking and following up, hunting down, doing detective work, and so on. Oh! who so busy as he? Found out that Edmund Gray was an old man, if you please; and this morning again, so cheerful and lively that it does your heart good—going to settle it all in a day or two. Yah! As if I couldn't see through his cunning! Why! I'm seventy-five years old. I'm up to every kind of dodge: what will happen next, unless you cut in? First, we shall hear that Mr Edmund Gray has gone abroad, or has vanished, or something. When he's quite out of the way, we shall find out that he did the whole thing—him and nobody else. And then if there's no more money to be made by keeping the papers, they will all come back—from Edmund Gray, penitent—oh! I know.'

'But about Athelstan Arundel?'

'To be sure. I'm an old man, Sir Samuel, and I talk too much. Well, I go most nights to a parlour in Holborn—the *Salutation* it is—where the company is select and the liquor good. There I saw him a week ago. He was brought in by one of the company. I knew him at once, and he wasn't in hiding. Used his own name. But he didn't see me. No—no, thinks I. We won't give this away. I hid my face behind a newspaper. He's been staying in Camberwell for the last eight years, I believe, all the time.'

'In Camberwell? Why in Camberwell?'

'In bad company—as I was given to understand. In Prodigal Son's company.'

'You don't mean this, Checkley? Is it really true?'

'It is perfectly true, Sir Samuel. I have seen him. He was dressed like a Prince—velvet jacket and crimson tie and white waistcoat. And he walked in with just his old insolence—nose up, head back, looking round as if we were not fit to be in the same room with him—just as he used to do.'

'By Jove!' said Sir Samuel, thrusting his hands into his pockets. 'What will Hilda say—I mean—Lady Dering, say, when she hears it?'

'There is more to hear, Sir Samuel, not much more. But it drives the nail home—a nail in their coffin, I hope and trust.'

'Go on. Let me hear all.'

'You've caught on, have you, to all I said about Edmund Gray of 22 South Square—him as was mentioned eight years ago—and about the handwriting being the same now as then?'

'Yes.'

'So that the same hand which forged the cheque then has forged the letters now?'

'Quite so.'

'I said then—and I say now—that young Arundel forged that cheque. I say now that he is the forger of these letters, and that Austin stood in with him and was his confidant. What do you think of this? To-night, after office, I thought I would go and have a look at 22 South Square. So I walked up and down on the other side: my eyes are pretty good still: I thought I should perhaps see something presently over the way. So I did. Who should come into the Square, marching along as if the old place, Benchers and all, belonged to him, but Mr Athelstan Arundel! He pulled up at No. 22—No. 22, mind—Edmund Gray's number—he walked up-stairs—I heard him—to the second floor—Edmund Gray's floor.'

'Good Lord!' cried Sir Samuel. 'This is suspicious with a vengeance.'

'Oh! but I haven't done. I stayed where I was, wondering if he would come down, and whether I should meet him and ask him what he was doing with Edmund Gray. And then—I was richly rewarded—oh! rich was the reward, for who should come into the Square but young Austin himself! He, too, went up the stairs of No. 22. And there I left them both, and came away—came to put the case into your hands.'

'What do you want me to do?'

'I want you to advise me. What shall I do? There is my case complete—I don't suppose you want a more complete case—for any Court of Justice.'

'Well—as for that—I'm not a lawyer. As a City man, if a clerk of mine was in such a suspicious position as young Austin, I should ask him for full explanations. You've got no actual proof, you see, that he, or Athelstan either, did the thing.'

'I beg your pardon, Sir Samuel. I'm only a clerk, and you're a great City Knight, but I don't know what better proof you want. Don't I see young Austin pretending not to know who Edmund Gray is, and then going up to his Chambers to meet his pal Athelstan Arundel? Ain't that proof? Don't I tell you that the same hand had been at work in both forgeries? Isn't that hand young Arundel's?'

'Checkley, I see that you are greatly interested in this matter'—

'I would give—ah!—twenty pounds—yes, twenty hard-earned pounds to see those two young gentlemen in the Dock—where they shall be—where they shall be,' he repeated. His trembling voice, cracked with old age, seemed unequally wedded to the malignity of his words and his expression.

'One of these young gentlemen,' said Sir Samuel, 'is my brother-in-law. The other, unless this business prevents, will be my brother-in-law before many days. You will therefore understand that my endeavours will be to keep them both out of the Dock.'

'The job will be only half complete without; but still—to see young Austin drove out of the place—with disgrace—same as the other one was—why, that should be something—something to think about afterwards.'

Checkley went away. Sir Samuel sat thinking what was best to be done. Like everybody else, he quite believed in Athelstan's guilt. Granted that fact, he saw clearly that there was another very black-looking case against him and against George Austin. What should be done? He would consult his wife. He did so.

'What will Elsie say?' she asked. 'Yet, sooner or later, she must be told. I suppose that will be my task. But she can wait a little. Do you go to-morrow morning to Mr Dering and tell him. The sooner he knows the better.'

You now understand why Mr Checkley was so joyous when he arrived at the *Salutation* and why he proposed that toast.

In the morning, Sir Samuel saw his brother and whispered in his ear the whole of the case, as prepared and drawn up by Checkley. 'What do you say?' he asked when he had concluded.

'I say nothing.' Mr Dering had heard all the points brought out one after the other without the least emotion. 'There is nothing to be said.'

'But, my dear brother, the evidence!'

'There is no evidence. It is all supposition. If Athelstan committed the first forgery—there is no evidence to show that he did—if he has been living all these years a life of profligacy in England—I have evidence to the contrary in my own possession—if he was tempted by poverty—if young Austin was also tempted by poverty—if the two together—or either separately—could undertake, under temptation, risks so terrible—you see, the whole case is built up on an "if."'

'Yet it holds together at every point. It is a

perfect case. Who else could do it? Checkley certainly could not. That old man—that old servant.'

'I agree with you, Checkley could not do it. Not because he is too old. Age has nothing to do with crime—nor because he is an old servant. He could not do it because he is not clever enough. This kind of thing wants grasp and vision. Checkley hasn't got either. He might be a confederate. He may have stopped the letters. He is miserly—he might be tempted by money. Yet I do not think it possible.'

'No—I cannot believe that,' said Sir Samuel.

'Yet it is quite as difficult to believe such a thing of young Austin. Oh! I know everything is possible. He belongs to a good family: he has his own people to think of: he is engaged—he has always led a blameless life. Yet—yet—everything is possible.'

'I have known cases in the City where the blameless seeming was only a pretence and a cloak—most deplorable cases, I assure you—the cloak to hide a profligate life.'

'I think, if that were so, I should not be deceived. Outward signs in such cases are not wanting. I know the face of the profligate, open or concealed. Young Austin presents no sign of anything but a regular and blameless life. For all these reasons, I say, we ought to believe him incapable of any dishonourable action. But I have been in practice for fifty years—fifty years—during this long period I know not how many cases—what are called family cases—have been in my hands. I have had in this room the trembling old profligate of seventy, ready to pay any price rather than let the thing be known to his old wife, who believes in him, and his daughters, who worship him. I have had the middle-aged man of standing in the City imploring me to buy back the paper—at any price—which would stamp him with infamy. I have had the young man on his knees begging me never to let his father know the forgery, the theft, the villainy, the seduction—what not. And I have had women of every age sitting in that chair confessing their wickedness, which they do for the most part with hard faces and cold eyes, not like the men, with shame and tears. The men fall being tempted by want of money, which means loss of pride and self-respect, and position and comfort. There ought to have been a clause in the Litany, "From want of money at all ages and on all occasions, Good Lord, deliver us."

'True—most true,' said Sir Samuel. "'From want of money"—I shall say this next time I go to church—"from want of money at all ages, and particularly when one is getting on in years, and has a title to keep up—Good Lord, deliver us." Very good indeed, brother. I shall quote this in the City. To-morrow, I have to make a speech at the *Helmet Makers' Company*. I shall quote this very remarkable saying of yours.'

Mr Dering smiled gravely. 'A simple saying, indeed. The greatest temptation of any is the want of money. Why, there is nothing that the average man will not do rather than be without money. He is helpless: he is a slave: he is in contempt: without money.—Austin, you tell me, was tempted by want of money. I think

not. He was poor: he had enough to keep him: he was frugal: he had simple wants: he had never felt the want of money. No—I do not think that he was tempted by poverty. Everything is possible—this is possible.—But, brother, silence. If you speak about this, you may injure the young man, supposing him to be innocent. If he is guilty, you will put him on his guard. And, mind, I shall show no foolish mercy—none—when we find the guilty parties. All the more reason, therefore, for silence.

Sir Samuel promised. But he had parted with the secret—he had given it into the keeping of a woman.

TRANSATLANTIC STEAMSHIP ROUTES.

SAFETY of ships at sea is a matter of the first importance to passengers, and more especially to the many who travel in those marvellous specimens of man's handiwork that cross the North Atlantic Ocean between the Old World and the New with the precision of express trains. Ancient navigators were necessarily required not only to be sterling seamen, but also to pilot their own vessels in narrow waters, and to rely solely upon that knowledge of the proposed path across the waste of waters only attainable by actual personal experience or from oral tradition. Modern mariners are well furnished with sailing directions and charts embodying the recorded observations of their predecessors; and more accurate instruments have been gradually introduced for determining a ship's geographical position on the trackless deep by means of celestial or terrestrial measurements. Nevertheless, the successful application of steam-power to the propulsion of ships at sea probably demands a more intuitive perception of possibilities than when the unbought air in sensible motion was the prime mover. Rapid progress in marine engineering has somewhat decreased the undisputed supremacy of seamanship, and navigation becomes less difficult every day, so that its rudiments are rendered available to men of most meagre education with but slight mental exertion. Hence both causes conspire to lower the shipmaster's status; but many officers are beginning to come out of their sleepy hollow of indifferentism and strive for better things.

It is conceded on all hands that the measures in force for preventing collision at sea are insufficient for practical purposes, and many and various plans have been devised for lessening this too prevalent cause of death and disaster. Four years ago, the question of distinct tracks for ships making passages in opposite directions was brought prominently under the notice of our Board of Trade; but the futility of this scheme, which looks so well on paper, was clearly pointed out by ship-owners and the London Shipmasters' Society. The great and ever-increasing number of tracks that converge in certain parts of the world of waters make fixed routes impracticable and undesirable for those crowded crossings. Swift steamships bound round the Cape of Good Hope, or running between Europe and North America, or between California and China, might find it advantageous to follow separate tracks for outward and homeward bound passages, so as to

avoid crashing into each other when proceeding in diametrically opposite directions.

Sailing-ships and slow steamers, however, have to be provided for; and it must not be forgotten that some of the most terrible collisions on record have taken place between sailing-ships and steamers. An American sailing-ship, the *Charles Bartlett*, collided with the British steamer *Europa*, when one hundred and thirty-five out of one hundred and seventy-seven emigrants were drowned by the sinking of the sailing-vessel. Another American sailer, the *Governor Fenner*, was sent to the bottom near Holyhead by the British steamship *Nottingham*. The *Governor Fenner* disappeared beneath the whirling waters within one minute, taking with her one hundred and twenty-two of her passengers and crew. Not a soul was saved except her master and mate, who contrived to clamber over the advancing front of the *Nottingham*. The French steamship *Ville du Havre* sank shortly after collision with a British sailing-ship, the *Loch Earn*, in 1873. No fewer than two hundred and twenty-six lives were lost; and had not the water-tight bulkhead of the sailing-vessel withstood the pressure of the sea-water pouring in cascades through her stricken side, every person on board both vessels would have been engulfed with them. Eventually, the *Loch Earn* also sank; but happily succour was nigh at that time. That pioneer Atlantic greyhound, the British steamer *Oregon*, ran right into an American schooner which was sailing without lights. Both ships sank within a short interval; but the loss of life was comparatively insignificant, although all on board the schooner perished with her. It is to be feared that occasionally an officer in charge of a steamship's deck defers altering his course till the very last moment. In the meanwhile, the sailing-ship officer begins to fear that the lookout on the steamer has not perceived his lights, performs some hurried manœuvre, and actually precipitates the collision which he sought to avoid.

Winds and currents differentiate the tracks of outward and homeward bound ships to some extent. Take, for example, the track followed by an antiquated timber-carrier making her way from Europe to New Brunswick under sail. From a glance at an atlas it would appear that this passage can best be made by steering in the direction of the setting sun; but taking into account the fact that westerly winds prevail along this route, it is not difficult to discern that the longest way round may be the shortest way to her appointed destination. Such a ship steers to the southward, after clearing the English Channel, as though bound across the equator, till the twentieth parallel of north latitude is reached; then steers to the westward before favourable breezes from the eastward; and when well over on the western side of the North Atlantic, curves to the northward to make her port. She thus escapes a pitched battle with adverse gales, is assisted by the Gulf-stream, and reaches her destination sooner, despite the longer distance sailed over by following the southern passage. When steam was in its infancy, the small-powered vessels were unable to make headway against the south-west monsoon when bound from Bombay to Aden, and were compelled to follow a more southerly track than the shortest

possible. Similar instances of separate routes marked out by meteorological conditions for outward and homeward bound ships are not far to seek.

The blue ribbon of the Atlantic passenger service is a much-coveted distinction, and the fleet steamships of to-day are timed to the nearest second, while strenuous efforts are made to break a record. The shortest course that can possibly be drawn between two points on the earth's surface is that of a great circle. Hence the most direct track between New York and Queenstown is indicated on a globe by a thread tightly drawn between the ports. This shortest distance measures only 2670 miles; but its western end passes over the land, so that a deviation has to be made. Moreover, numerous icebergs drift down from the Arctic regions directly across part of this track during the greater part of each year; many fishing-vessels lie at anchor on the Grand Banks of Newfoundland with their hardy crews, pursuing a most dangerous calling, and not infrequently concealed from view by dense fog peculiar to that region, where mingle the waters of the cold ice-bearing Labrador current and the warmer life-giving Gulf-stream; and the outlying Virgin Rocks must be allotted a wide berth. Hence the desirability and absolute necessity of keeping to a route which shall approximate nearly to the great circle track, while at the same time combining directness with safety. The nearest available points of Europe and America may some day in the near future become important factors in affording a minimum of time and danger on the transatlantic passage. Public opinion tends towards the adoption as terminal ports of Whitehaven, Nova Scotia, on the American coast, and Milford Haven on this side of that ocean which but joins the two kindred nations it divides. The oversea distance is thus decreased by one-third, and could be accomplished in four days by fast steamships specially built for carrying mails and passengers only. A thirty hours' journey by rail covers the distance between New York and Whitehaven, so that, by following this route, it would be possible for a person setting out from London to arrive at New York within five and a half days.

It has long been felt that danger from collision might be considerably reduced if passenger steamships crossing the North Atlantic were compelled, under heavy penalties, to follow totally distinct routes on the outward and homeward passages. One of America's most renowned sons, the passage-shortener Maury, drew up a serious scheme for this very purpose as far back as 1856. It was based upon a critical examination of many logbooks kept on board passenger steamships belonging to the well-known Cunard Line, whose proud privilege it is never to have lost the life of a passenger out of the many thousands they have carried; and the now defunct Collins Line. Maury found that the zone traversed by these splendid steamers was about three hundred miles wide when going westward, but only about half that width on the homeward track. Having this zone clearly defined on a chart, he took a band of about twenty miles to the northward for his proposed outward track, and another band of twenty miles to the southward for his homeward route. These routes were fifty miles apart near

Cape Clear, and two hundred miles in about fifty degrees west longitude. He took no account of seasonal requirements, and therefore crossed the Banks of Newfoundland at all times, notwithstanding the icebergs, fogs, and helpless fishing-vessels, likely to endanger the safety of swiftly-moving steamers.

In 1878, Messrs Ismay, Imrie, & Co. requested the Board of Trade to consider the advisability of compulsory outward and homeward tracks, which they had previously brought under the notice of the North Atlantic Steam Transport Conference, held at Liverpool in 1876. They proposed to follow Maury's plan with slight modifications, but failed to obtain that unanimity among shipowners which is essential to success. The United States Hydrographic Office has consistently and energetically advocated the adoption of distinct routes, and on each month's issue of that Department's invaluable North Atlantic Pilot Chart have been clearly laid down those outward and homeward tracks between New York and Queenstown which are deemed the shortest possible, having regard to safety. The transatlantic route was a plank in the platform of the International Maritime Conference held at Washington in 1888-89, and a resolution was carried to the effect that fast passenger steamers during spring and summer months should follow a route leading clear of the Grand Banks of Newfoundland, in order to avoid the fog and ice of that dangerous locality. They, however, found that the enforcement of an international compulsory use of such a route was hedged round with difficulties, and could not be recommended.

There is at present an almost insuperable difficulty in enforcing the rule requiring vessels to proceed at a moderate speed in thick weather or snow. Sailing-ships cannot always regulate their speed, even if they would, for once having kept before a freshening gale, it is sometimes simply impossible to bring them to the wind without endangering the masts and the safety of all on board. Then, again, shipmasters fairly urge that steamers answer the helm more readily when moving swiftly through the water; and, moreover, the chance of collision is lessened by shortening the period spent in the fog. Postal contract time must be kept despite atmospherical conditions. As a general rule the swifter ship stands the best chance in the event of a collision, and being thickly peopled, it is more important that she should survive. Finally, no definition of what is meant by moderate speed has yet been given, and that speed which is merely the result of turning over an ocean greyhound's engines would be a fair speed for a bluff-bowed collier-craft under canvas.

Compulsory routes seem an impossibility, yet it is undesirable to lay down international rules unless enforced by heavy penalties. Icebergs, sailing-ships, fog, and steamers cutting across the tracks on northerly or southerly courses will harass the best-laid routes; but nevertheless greater immunity from disaster is secured by their general adoption. The Conference at Washington strongly recommended that the large lines of passenger steamships might well come to some decision on this point among themselves, so as to establish and adhere to particular routes. From March to November no fewer than six hundred

vessels belonging to the United States, British North American provinces, France, and Portugal, are fishing on the Grand Banks. In fact, some United States schooners fish for halibut there even in the depth of winter. Fishermen's safety is best promoted by their own unceasing vigilance, and a careful compliance with the present rules, especially those referring to light and sound signals. It is said that if fast steamers were kept off the Banks, the fishermen might become careless, and thus lay themselves open to danger from other vessels when least expected. It cannot be denied that the travelling public clamour for quick passages, and that record-breaking is of paramount importance; so that, if the rule with respect to proceeding at a moderate speed in fog or snow could be rigidly applied, then it would be the interest of swift ships to keep clear of the fishermen's anchorage on the Grand Banks.

We are glad to see that the persistent leverage of the United States Pilot Chart and the recommendation of the Conference have raised the question of outward and homeward routes into a more possible plane. The Cunard, Guion, Inman, National, and White Star transatlantic steamship lines have formally agreed upon distinct routes to be followed by all the vessels of their world-renowned fleets. Since this agreement came into force on the 16th of last November some continental companies, the North German Lloyd, the Hamburg-American, Compagnie-Générale Transatlantique, and the Red Star of Antwerp, have come in with some slight modifications. Let us sincerely hope, for the sake of all concerned, that the chosen tracks will be strictly followed, and that other companies may adopt them without delay. In proportion as the number of vessels using these tracks is increased, the risk from collision is lessened; and a broken-down steamship, or a crew compelled to take to their frail boats, will know within moderate limits of error whither to steer in order to be rescued from their perilous position as soon as possible.

The American Hydrographic Office advised that steamships sailing to or proceeding from the English Channel should follow the same tracks as those setting out from Queenstown going or coming on at the twentieth meridian of west longitude; but the actual courses chosen by the continental lines do not coincide with the Queenstown route until near the Grand Banks, thus enlarging the area within which vessels bound east and west are liable to meet each other. The distance saved is only six miles for the northern route and nine miles for the southern. We are not surprised to read that the American authorities are gratified by this new departure, which in its most essential features is almost identical with that so ably advocated on the Pilot Chart ever since 1887. Western-bound steamships get the benefit of the Labrador current setting to the southward, and those bound to the eastward go sufficiently far to the southward to be set towards their ports by the Gulf-stream. At the same time, along that belt which lies between the outward and homeward tracks, the danger to fishing fleets and other vessels is reduced to a minimum. To the northward of this unfrequented region, danger may be looked for principally from the eastward; whereas, to the

south of this no-man's land, danger will come from the westward in the shape of steamships bound to Europe. It would be suicidal to keep a careless lookout on the ground that a ship was running along the track, and therefore out of harm's way, for the introduction of specified steamship routes does not get rid of the danger always in evidence at converging points, though it does certainly render the chance of disaster much less.

Two Danish steamers belonging to the same company, the *Geiser* and the *Thingvalla*, proceeding in opposite directions, collided with each other in mid-Atlantic, when loss of life ensued. Such a catastrophe would have been impossible had they kept to distinct outward and homeward routes. On the other hand, a collision like that between the two White Star steamers, *Celtic* and *Britannic*, will occasionally occur despite every precaution, inasmuch as the shipping at the terminals of the routes is very congested. Two leviathans are being built on the Clyde for the Cunard Line, in anticipation of an increased demand for accommodation of passengers attracted to America by the forthcoming Chicago Exhibition. They will each be six hundred feet long, about twelve thousand tons gross, and propelled by twin screws, are expected to make twenty-two knots an hour and break the record by half a day. The enormous momentum of such a heavy ship proceeding at this high rate of speed makes us shudder to think about, and affords an excellent object lesson of the need which existed for separate outward and homeward tracks.

Sophocles sang of the power displayed by the human race in rendering the elements subservient to their will, and his first illustration is inspired by the skill and daring of the navigator. Horace, in that beautiful ode to the barque about to convey Virgil to the Grecian shores, marvels at the courage of him who first put to sea; and Ovid sings in similar strain. To-day, although navigation is more precise, danger is ever present; and whatever tends to greater safety is worthy of praise.

A BOYCOTTED BABY.

CHAPTER IV.—THE DAY OF WRATH.

LORD POLONIUS was, from his own point of view, quite as interested in the marriage of his daughter to James Bulbous as the latter's father. Matthew had shown himself very liberal upon the matter of settlements; the sale of the family estate would be disguised by the assumption of the family name by his daughter's husband and the descent of the estate to her issue; and the prospect of having two votes in the House of Commons and a wealthy family connection, involved in a manner the rehabilitation of a very dilapidated nobleman.

Matthew Bulbous was aware of all this, but regarded the whole matter as one of business, in which there must be advantages on both sides, and he was satisfied with the bargain. Knowing the views of Lord Polonius, therefore, it was no matter of surprise to him to receive a letter from that nobleman the morning after the occurrences related in the last chapter, hinting that

if Mr James Bulbous returned to England now there would be no insuperable difficulties in the way of the early realisation of their mutual wishes.

The letter came at an opportune moment, when the only obstacle to the marriage had just been removed; and Matthew Bulbous was able to regard the situation now with satisfaction. He shook off the disordered feeling which had kept him from his bed all night, and astonished his wife at breakfast by telling her that her son was coming home, and that his room must be aired and got ready for him.

Her request that he would unlock the door or leave the key, reminded him that the room was still locked up. Taking the key from a drawer in his study he went thoughtfully up the stairs, to see if by chance any memorial of the dead wife should be lying about the room. He found it just as he had left it. The photographs still lay on the table, covered with dust. One by one he picked them up again, and wondered if any of them represented the deceased woman. He concluded it would be best to burn them; and collecting them in his hands, he bore them down to the study and cast them on the fire. There was one which chanced to turn face upwards, and recognising it, he snatched it away before the fire caught it. The expression of astonishment and relief which filled his face as he looked at it again was remarkable. He remembered holding it in his hand the day he locked up the room, and it was marvellous to think that, after seeing it only once, the face should have so fixed itself upon his memory. The dark eyes and pretty face!—here, in truth, was the phantom which had been haunting his disordered brain—the face he had recognised, without seeing it, in his sleeping vision on Christmas eve, and which he had fancied beneath the heavy veil beside his son in the mourning carriage.

'There's no accounting for these tricks!' was his relieved reflection as he tossed the photograph contemptuously into the fire and watched it burn to ashes.

This incident, connected with the effect of Lord Polonius's letter, put Matthew into high spirits as he proceeded to London. He looked upon his worries as practically over; and as soon as his son returned to England, he would see that not a day's unnecessary delay interfered with the completion of the matrimonial project.

'The engagement has lasted long enough,' he said to himself, as he sat down in his office and wrote out the telegram recalling his son. That was how he regarded it. The matter had not been mentioned to James Bulbous yet; but the idea of his will being opposed by any person in his family was foreign to Matthew's thoughts. He did not even think it necessary to mention the matter to his wife again. He was sufficient for himself.

He expected a call from his brother, and decided that Joseph might as well emigrate at once, now his last duty was finished. Probably, however, he would not come over until after the interment of the child; and Matthew reflected with approval on the quiet and unobtrusive manner in which such rites were commonly performed at early hours of the morning. It was now eleven o'clock, and no doubt the child had

been lodged in the cemetery hours ago. That was the usual way.

He was just thinking that he would go round to Lord Polonius and arrange about fixing a date for the marriage, and was feeling altogether in an excellent frame of mind, when a telegram was brought to him. Carelessly tearing it open—for telegrams were coming to the office every hour in the day—the first glance caused him to start, and then he leaped to his feet. The message was from his brother—he knew this well, though there was no name to it—and had been handed in, not at Chelsea, but at Gravesend. This was what it said: '*Look out for yourself. I am off.*'

Matthew Bulbous was a man of very quick apprehension when there was sign of danger. He knew the meaning of this ominous message—he knew, at least, that he was in peril in connection with the death of the child. But what had happened? The child was dead. That was all he knew. Yes—Joseph warned him to 'look out for himself,' and had fled. There was enough in this to warn him what had happened; but his ignorance of the circumstances almost paralysed him. He dared not go to inquire.

One agency of intelligence he fancied, yet feared, might throw some light on his situation. The early editions of the evening papers were out—he could hear the news-boys' voices in the distance—but he dared not send any person from his office to procure one. He seized his hat, and pulling it as low as he could over his ashy face, proceeded to Charing Cross station, and, buying a paper, carried it to the farthest end of the platform, over the embankment, before he opened it.

The flaring headlines made him stagger the moment he opened the sheet. They announced an 'Alleged Child Murder in Chelsea—Arrest of the Baby Farmer—Startling Disclosures expected.' The authorities, it was stated, had had their eye upon the woman Griffon for some time past, their suspicions having been aroused by the frequency of the infant casualties at her establishment; and she would have been in the meshes of the law long ago but for the protection of medical certificates. It was hinted that several 'names, well known in business, political, and social circles,' were likely to be compromised in providing a sensation of no ordinary kind in the course of the inquiry into Mrs Griffon's affairs.

The significance of this ominous warning Matthew Bulbous, now thoroughly terrified, took wholly to himself. His limbs shook with fear. It mattered nothing to him who the others might be; he was himself certainly one, and the one in the worst plight, for it was he who was responsible for the victim whose death caused all the trouble. Others might be exposed and disgraced; but he, Matthew Bulbous, would to a certainty fare worse. There were the consequential penalties, too, often far heavier than the penalties of the law, and always more certain. There was the ruin of all his schemes, of his business, of his position in the world, of his character. His son would despise and repudiate him, his friends would drop him, his clerks would laugh at him, his enemies—he was conscious of having a good many—would exult over him. There was not one who would regret him.

Yes—there were two; he knew it now, with a pang; two despised and neglected women who would cling to him all the more. But of all the world there was no person's attitude which would cut him to the quick like the cool and deadly hauteur with which Lord Polonius would drop him, comforted by the possession of ten thousand pounds of his money. He had already felt the sting of being beaten by the wily old peer, but it was far worse now. Oh, how the misfortunes of Matthew Bulbous would have been lightened had it been possible to associate Lord Polonius with the disgrace! But the Earl had been too many for him.

With an ashy face and a heart that quaked at the sight of every policeman, Matthew walked to the cab-rank and jumped into a hansom, giving the man an address. In the course of his business Matthew Bulbous came in contact with professional men of shady character and sharp wit, useful in certain lines of work, and one of these he now thought of as best qualified to help him. He found the lawyer, and with business-like directness laid the case before him.

'It's ugly, Mr Bulbous,' said the lawyer, whose name was Mr Clove—'it's undeniably ugly. But isn't it just possible you may be exaggerating the danger?'

'I am exaggerating nothing,' replied Bulbous impatiently. 'But we must be prepared to meet the worst. If the worst does not come, so much the better; but we must be ready.'

'Very well. I'll do what I can. First of all, give me your brother's address.'

'He has cleared out.'

Mr Clove's face lengthened. 'That is unfortunate,' he observed. 'It would have been better in every way for you if he had stood his ground. I may spend money, I suppose, in case it should be necessary.'

'As much as you want.—I will only add,' said Matthew Bulbous as he took his hat, 'that if you manage this business successfully, Mr Clove, it will be the best piece of work for yourself that you ever have done.'

Mr Clove looked gratified when his client left him, not on account of the professional emolument which the case promised to yield—though this was no small matter to him—but from the more disinterested satisfaction which one rogue naturally derives from the embarrassments of another and more successful one.

Matthew Bulbous passed a bad afternoon. He was afraid to return to his offices, dreading what might have taken place there during his absence. He spent the time going from place to place on pretence of one business or another. He wanted the office to be closed before he returned, then he would steal in and sleep there; for he was determined not to go home again, and that his arrest should take place in London and not in his own house at Blackheath.

He felt weak and sick when he got back. There were two or three rooms furnished on the first floor, and it was his habit sometimes to stay there for the night when anything kept him late in town. So he went up-stairs, and lay on his back on a sofa, with the light turned down, to try to think.

He found thinking a painful and useless effort under the burden of suspense that oppressed his

mind. He bitterly regretted having despatched that telegram to his son, and forgotten to cancel or recall it. Jen would be home next day, or the day after—and Matthew Bulbous was afraid to meet him. Did they know anything about the baby yet, those two innocent and submissive women at Blackheath, from whose compassion and undeserved affection he shrank most of all? Had the police been there—and if so, what must his wife and daughter be thinking of him?

The housekeeper set forth on the table such dinner as she could manage on so short a notice. He tried to eat, but failed; then he mixed some spirits and water in a tumbler and left it untasted. So he lay down on the sofa again, with his face turned up to the ceiling, until presently a ring at the bell below made him leap to his feet. He listened, with quaking heart. After some delay he heard the housekeeper coming up the stairs, closely followed by a heavier foot-step. Matthew Bulbous went over to the hearth-rug and, resting his elbow on the mantel-piece, waited with rigid face and steady eyes fixed on the door. A desperate calmness came to him now that he felt the dreaded moment had arrived. His heart told him that the heavy step coming up the stairs was that of a police officer. But it proved to be Mr Clove.

'Oh, it's you, Mr Clove?' he observed, with perfect command over his countenance, and pointing to a chair. 'I can't offer you much to eat,' he added, 'or I would ask you'—

'A thousand thanks; Mrs Clove is expecting me to dinner. I was driving past when I noticed the light, and thought you might be here.'

'I sometimes stay here for the night when I am pressed with business,' said Mr Bulbous; and then he sat down and looked at the solicitor.

'I have been to Chelsea. The doctor has been arrested. You had no relations or correspondence with him, I understand?'

'No,' said Matthew, wincing. 'I know nothing about the man.'

'I'm very glad of that. It is one danger the less.'

'Well?' inquired Bulbous, after a pause. His face, stiffening in rigid, desperate lines, was that of a man who felt himself being driven to the wall.

'The inquest will be opened to-morrow'—

'What inquest?'

'The inquest on the child—the body.'

'Oh, of course; I forgot.'

'It will only be opened, and then adjourned for the post-mortem. It seems such a despicable little thing to make so much fuss about; however, there it is.'

'I know it is, Mr Clove,' said Bulbous; 'but will you please come to the point. Is there any possibility—say, that money can command—of my keeping out of the accused case?'

'There is none, Mr Bulbous. We must proceed on that certainty, and meet it as best we can. I want you to have a very clear recollection of your transactions with that woman. There was no witness, and no written agreement—so far so good. You paid her the guarantee of fifty pounds'—Mr Bulbous made a grimace—'in advance. In what form did you give her the money?'

'Cash—gold.'

'Very good. There is, then, no evidence of that transaction. And the assistant kept by Mrs Griffon—good heavens! what a place it is—is an idiot; she can give no evidence. Finally, you had no communication with the doctor.'

'I had!' said Bulbous, with a sudden stop, which the lawyer understood as a silent malediction. 'The fellow sent me a certificate yesterday, and he had a cheque for it.'

Mr Clove started, and after a moment rose and walked twice the length of the room. His looks showed what he thought of this part of the case. 'Then the police have possession of your cheque, as surely as the sun shines at noonday. The doctor had not yet left his bed, after a debauch the night before, when they arrested him. That cheque, I fear, will put them on your track.'

Matthew Bulbous, with silent curses, thought also of the two telegrams from his brother. He told Clove about them, and Clove was ready to curse likewise.

'Do you know,' Matthew asked, with dread, 'whether the police are—are looking for me?'

'Why, no. If they were, of course they would quickly find you. The warrant will not be issued before to-morrow; very likely, when the coroner has received some evidence—that is, in all probability,' said Mr Clove.

'Will they want me at the inquest?'

'I think not. I am afraid your attendance will be required in—ahem; in another place, Mr Bulbous, in a different capacity,' said Mr Clove, with professional delicacy. 'Your best course, meantime, will be to say nothing to anybody. We must simply wait and watch events, and take advantage of every point that presents itself in our favour. Silence at present is our only strength.'

After the lawyer left him, Mr Bulbous lay down again on the sofa, face upwards. The woman came by-and-by and removed the things from the table, leaving the whisky and the water, and placing a box of cigars beside them. Later on she came again with coffee, glancing nervously at the still and silent object on the sofa. The coffee became cold, the clock on the mantel-piece struck hour after hour, and he did not move. At ten she came again, and left his chamber candlestick, asking timidly if he should want anything more. There was no answer; and the woman, half-frightened, quickly retreated to the basement.

About two hours later she heard him descend the stairs and go out. He was too miserable to stay there alone with his thoughts. A greasy mist was falling. With a fur cap, which he found somewhere in the rooms, drawn over his eyes, Matthew Bulbous strode rapidly across the park, and up to the King's Road in Chelsea. The streets were deserted, for the public-houses had been closed some time. He halted at the top of the street in which his brother had lodged and ground his teeth. On the approach of a policeman he went on towards the Embankment. This is as dreary a place as London provides for the homeless and troubled at night. Once or twice he sat on one of the seats for a time, looking at the long lines of lamps, and sometimes he hung over the wall. Then he wandered on aimlessly, keeping by the water. At Westminster Bridge, where he eventually found himself, he halted

undecidedly, with the manner of one who knew not which way to turn for rest. He looked up at the dark sky, and the greasy drizzle poured down on his face. Then he went on the bridge, leaning on the parapet, and gazing down the river towards his home. He had never before thought of his home with such feelings as filled him now. When he thought—as, in his misery, he was forced to think—of the despised and neglected fidelity which existed for him there, the iron of remorse pierced the thick resisting crust that encased his heart. In less than three minutes he turned about quickly and crossed to the other side.

Resting his elbows upon the parapet, and looking down at the dark water, the beaten man was thinking, with a low heart, of the sensation his fall would cause amongst all who knew him. In that remote country parish, where his rise in the world was a perennial wonder; in London, where his character stood so high as a successful man; in Blackheath, where he towered head and shoulders above his neighbours; in his own house, down the river behind him; in his office, among the forty clerks who trembled at his glance. Excepting the wife and daughter, whom he had despised, there was not one of all who would pity him or regret him. Pity!—in that thought lay the bitterest sting; let all the world exult over his ruin, if it would, rather than one living creature pity him.

A homeless woman, shivering and wet, was gliding past like a shadow, when she suddenly halted and glanced at him with a manner of mingled curiosity and compassion. For he looked like a man lately brought down to the level of those who haunt the bridges at midnight. He resented the woman's observation, and as he turned his back to her she passed on.

A battle of all his forces of brain and character against this miserable result of his own folly had been silently raging for hours. At last he gave in—acknowledged himself beaten. But the spirit which had worked his success in the world and built his character revolted against submitting to the impending disgrace. He wished that, like the Hebrew giant, he could pull down all his enemies and rivals amongst the ruins of his own career. At least he could deprive them of the spectacle of his fall.

The tide he stared down at, from the bridge, rushing to its end swift and dark and defiled, was fit emblem of his life, his ruined career. They were so like, the two—the river and the life—why should they not go down together?

There was a sudden sound in the midnight air which gave him a start. 'Big Ben' was chiming the hour from the high tower of Westminster Palace. Matthew Bulbous listened under a hypnotic spell. What was it that he heard? The self-same message that he had listened to with exultation of spirit from the bells on Christmas eve; only it sounded like a knell now, with ominous mockery in its funereal vibrations. 'Jem's—wife—is—dead!' Four times it boomed down from the lofty and invisible tower, as from the depths of the sky. Then there was a long pause of suspense—such as may still the world's trembling heart between the last echo of the crack of doom and the blast of the archangel's trumpet—and then a single mighty stroke boomed

from the tower and rolled in deep reverberations over the silent city.

Matthew Bulbous was roughly roused from a dangerous mood by a passing policeman. 'Move on, my man. This is no place for you—move on.'

Fancy Matthew Bulbous having to slink away, with the constable slowly following, and the constable's eye watching his every movement, until he disappeared up Parliament Street. The mental paroxysm—which had nearly closed on a tragedy—had passed, and the outer forces were at work again as he strode fiercely towards Charing Cross. It was well for Joseph Bulbous that he was out of his brother's way that night.

OXYGEN AS A COMMERCIAL PRODUCT.

So rapidly has the consumption of oxygen increased of late in the many and varied purposes for which it has been found suitable, that the manufacture of oxygen on a commercial scale has not merely taken root, but is developing into a new and important branch of industrial enterprise. In view of the increasing demand for the gas under consideration, we now purpose laying before our readers some succinct account of a process now actively employed in producing oxygen, together with some brief notes of the method of distribution for consumption, concluding our remarks by a short allusion to the many arts, manufactures, and sciences in which this gas is now being extensively utilised.

Some thirty years ago, Boussingault, the eminent French chemist, discovered that at a temperature of about one thousand degrees Fahrenheit the monoxide of the metal barium would readily absorb oxygen from the atmosphere, and that on increasing the temperature to about seventeen hundred degrees Fahrenheit the oxygen thus absorbed would be given off. In view of such facts, Boussingault advocated the use of barium oxide for the economical production of oxygen on a large scale from the atmosphere. It was not, however, till recently that various difficulties which arose were overcome by the brothers Brin, and the process bearing their name became an industrial success.

Barium oxide is a mineral substance closely resembling lime in its properties. It is found combined in nature as 'heavy spar' and 'witherite,' and most frequently in lead districts. One of the most important salts formed from the raw material is nitrate of barium, commercially known as baryta, and used in the Brin process. After careful preparation, the baryta is stored in air-tight drums, ready for use.

Without unnecessarily describing in full detail the various minutæ of the Brin process for producing oxygen, we may briefly state that the discovery already alluded to of Boussingault is followed—namely, air is forced by pumps into retorts containing baryta, which absorb the oxygen of the air, the nitrogen of the atmosphere being allowed to escape. When sufficient air has been pumped in, the process is reversed after a suitable interval, and the oxygen yielded by the baryta is pumped into a holder. The oxygen thus formed is sent out to consumers in cylinders of steel, ranging in size from three and a half to

five and a half inches in diameter, and from one to eight feet in length. By means of special pumping machinery, the oxygen is compressed into these cylinders to a pressure of no less than eighteen hundred pounds per square inch, or, in other words, to a pressure of one hundred and twenty atmospheres.

It will readily be understood that great care is requisite in the manufacture of cylinders to withstand such high pressures; but the rigid system of testing enforced is an effectual safeguard, for every cylinder before being filled with oxygen is tested by water-pressure to about four thousand pounds per square inch. Series of severe tests have demonstrated the enormous strength of the cylinders employed, heavy weights having been dropped on them without producing leakage or damage. At the present time an enormous number of cylinders are daily in use, being delivered up and down the country, and then returned to the oxygen-works by consumers for a further supply of the gas, without accident or mishap of any kind.

The numerous purposes to which oxygen is now applied form a formidable list, and strikingly demonstrate the position this gas has already obtained as an article of commerce. In laboratories, oxygen is extensively used in conjunction with coal-gas for blowpipe purposes, in glass-working, platinum-working, brazing, &c. The medical faculty are now favourably regarding oxygen, and for a variety of complaints are recommending the gas. Oxy-aerated water is coming into favour, as possessing no lowering effects on the system, whilst acting as an agreeable stimulant. In cases of dyspepsia, diabetes, gout, and rheumatism, and kindred diseases, the new oxygen water is being prescribed with every success. For limelight purposes oxygen is being extensively employed, and projectors for ships, yachts, &c., for signals and communications by night are being supplied with the gas compressed in cylinders. The inhaling of oxygen is being prescribed now for patients, and the ready means by which a small cylinder of the gas can be procured and breathed greatly facilitates treatment by such process. Owing to its power of destroying disease germs, oxygen is strongly recommended for diphtheria and throat affections. Every one is familiar with the optical, or more popularly termed 'magic' lantern; and the introduction of oxygen compressed in cylinders has very greatly facilitated and safeguarded the extended use of oxy-hydrogen limelight in this excellent means of amusement and instruction.

A REGIMENTAL MYSTERY.

THE officers' mess bungalow of the Marlshire Regiment gleamed white and solitary in the silver beams of an Indian full moon. The last little knot of diners had left the bungalow at midnight. The only sign of life in the neighbourhood was the sentry, who paced steadily round and round the long low building, wondering when it would be two o'clock and time for him to be relieved. The mess bungalow stood on the edge of the great plain which on three sides surrounds the military cantonments of Meanpore. At the rear of the mess bungalow was a row of smaller houses, each

with its own compound of half an acre. These were the officers' quarters. Behind them stretched the parade ground, two hundred yards broad, backed in turn by the range of barracks—five great stone buildings, of two stories each—and behind the barracks lay, first, the so-called European bazaar, and then the teeming native city, which it was the duty of the British troops, in the Anglo-Indian sense, to 'protect.'

The welcome sound of a gong, struck twice at the distant mainguard, told the sentry that the hour of his release had come; and soon the advancing tramp of the relief caused him to stand to attention with shouldered rifle. The quick challenge and reply broke sharply on the stillness of the night; a young soldier stepped from the ranks of the relief and took the tired sentry's place; the sergeant mumbled the usual formula of instructions, and then marched his three files off to relieve guard at the magazine, half a mile away. The place was silent and deserted again, save for the tramp of the new sentry, who resumed the tour of the bungalow just where his comrade had left it off. But the new man did not seem to be possessed of the peripatetic inclinations of his predecessor. Scarcely had the measured tread of the relief died away in the distance when he came to a halt on that side of the bungalow which faced the open plain, and 'stood at ease.' Thus he remained for fully half an hour, looking straight to his front across the moonlit expanse, with his knee bent and his hands lightly clasped in the regulation attitude. A fine stalwart young fellow, he would have made a good study for a statue of the British soldier on guard in time of peace.

But while the sentry was giving a 'sitting' to some imaginary sculptor, a strange thing happened on the other side of the bungalow—that which faced, and was nearest to the row of officers' quarters. The door of the mess bungalow opened, and a man came quietly out into the veranda. He was clad in a long cloak, which gave the wearer a peculiarly bulky appearance. He looked this way and that; then he shut the door of the messhouse; and finally he flitted stealthily away in the direction of the officers' bungalows, round the corner of one of which he disappeared. From which proceeding a rather wide field of conjecture would have been opened up, had there been any one there to form it, as to the nocturnal wanderer's destination. This might either have been the officers' quarters, the barracks, the European bazaar, or the native city; but there was no living soul there to form any theory on the subject, much less to see where the man with the cloak really went.

A quarter of an hour later the statuesque sentry came smartly to attention, brought his rifle to the slope, and began his march again. Round and round the bungalow he paced till he had made the circuit exactly a dozen times; then, when he came to the side facing the plain—the spot where he had stood at ease so long—he paused once more. Drawing a ball cartridge from his pouch, he leisurely inserted it in the breech of his rifle, took a steady aim at the very centre of the placid moon sailing through the cloudless sky above, and fired. The bullet went soaring skyward to drop harmless in the desert a mile away, and the sentry sup-

plemented the sharp report of his rifle with a vigorous cry of, 'Guard, turn out!'

The mainguard was three hundred yards away on the barrack side of the parade ground, but in a few minutes a detachment of the guard came up at the double.

'Well, Golding, what is it?' said the sergeant as he halted his men in front of the sentry.

'A man came round the corner of the bungalow and ran away across the plain. I challenged twice, and he made no reply, so I fired,' was the sentry's report.

'Did you hit him, do you think?' asked the sergeant.

'No, I don't think so,' said Private Golding; 'he kept on running, at least.'

'What did he look like?'

'He was a native by his dress; he wore a white tunic and a red turban, and I am nearly sure his feet were bare.'

'Any signs of the mess being broken into?' asked the sergeant. 'Was he carrying?—Ah! here comes the officer of the day;' and the non-commissioned officer retailed the occurrence, as reported by Private Golding, to a young lieutenant who joined the group.

'The fellow must have been trying to break into the mess,' said Lieutenant Holbrook.—'Sergeant, you had better go and call the messman and tell him to bring his keys. Leave word at the Colonel's bungalow, too, as you pass; though I expect he'll be here directly; I saw a light in his window as I came along.'

Colonel Norman and the messman—the latter with his bunch of keys—arrived on the scene almost simultaneously. The Colonel, on hearing the sentry's story, at once gave orders to have the messhouse searched, to see if any traces of the mysterious visitor could be found inside the building. The door was unlocked, and Colonel Norman, with Lieutenant Holbrook and the messman, entered the bungalow, leaving the sergeant of the guard and his men outside. Private Golding resumed his walk round the house.

The rays of the moon shone through the windows, and made the interior of the bungalow almost as light as day. The anteroom was in just the same state as when the officers left, nor could any signs of the presence of a stranger be detected in the dining-room. But the search-party instinctively made for the small closet at the extreme end of the building where the regimental plate-chest was kept. Here there was no window and all was darkness.

'Better light a lamp, messman,' said the Colonel; 'this is where the damage will be, if the sentry really saw some one.'

The lamp was brought, and there, sure enough, was the regimental plate-chest with its lid wrenched off, and half the contents strewn on the floor around. Silver goblets and salt-cellar, costly trophies of quaint device, entrée dishes and cruet frames, were heaped up in glittering confusion.

'The gold centre-piece!' exclaimed the Colonel; 'I don't see it here. Whatever you do, don't tell me that *that* is gone.'

The messman knelt down and rummaged the chest. 'Yes, sir,' he said; 'it's gone right enough. It's big enough to be missed at a glance, and I

locked it up in the chest myself barely three hours ago.'

The three men stared at each other with deep concern. The gold centre-piece was the pride of the regiment. It was a large model of the farm of Hougoumont, which the Marlshire Regiment had defended so gallantly at Waterloo. The four corner-pieces represented officers in the different uniforms worn by the regiment since its formation in the beginning of the last century, and the whole of the ornament was wrought in the finest gold. Apart from sentimental considerations, the intrinsic value of the centre-piece could not be less than three or four thousand pounds. It was known throughout the army as the most costly piece of plate in use at a mess-table, and so greatly was it prized, that it was only brought out on guest-nights and other special occasions.

Colonel Norman was a man of prompt action. Leaving the messman to repack the ransacked chest, he strode to the door of the bungalow where the guard was waiting, followed by Lieutenant Holbrook. The sentry, still on his beat, just then approached the party.

'Sergeant,' said the Colonel, 'relieve that man at once, and put him under close arrest. Bring him up to the orderly room in the morning. A daring robbery has been committed, and the matter must be further inquired into before I can acquit the sentry of neglect of duty—or worse.'

Private Golding staggered, and almost dropped his rifle as he handed it to the escort which was told off to make him prisoner. His face was deathly pale in the moonlight, and he trembled so that he could hardly form his words. 'Robbery, sir!' he almost wailed; 'oh, don't say that! It cannot be; surely—surely there is some mistake. The mess robbed. Oh my God! I never thought of this.'

The Colonel looked at Golding curiously. 'Well,' he said, 'you ought to be the last man to be surprised at hearing the mess has been robbed. You say you saw a man come round the bungalow, and fired at him. People don't prowl about at night and risk being shot for nothing. However, I will deal with the matter in the morning.'

Colonel Norman and the lieutenant went back to their quarters. The messman locked up the bungalow, and the sergeant marched his prisoner to the guardroom, leaving another man in his place. Golding seemed dazed at what had happened, and it was not till the sergeant was locking him into the cell he was to occupy that he spoke a word. Just as the iron-barred door was being closed upon him, he said: 'Sergeant, I must see my Captain in the morning before I come before the Colonel; would you kindly let him know?'

'See your Captain!' replied the sergeant; 'of course you'll see your Captain. It's his duty to be present when any one of his men is brought up in the orderly room.'

'Yes, yes,' said the prisoner; 'but I want to see him here, privately, before I go before the Colonel.—Can you manage it for me?'

'Well, that's as your Captain likes,' replied the sergeant. 'I'll let him know, anyway.—What company are you in? Who is your Captain?'

'F company, Captain Strudwick,' said Golding; and then the door was shut with a clang and the ex-sentry was left alone to his meditations.

Captain Leonard Strudwick sat in his quarters on the morning after the occurrence just related. He had breakfasted at the mess, and had joined in the lamentations of his brother-officers over the loss of the gold centre-piece. Now he was smoking a quiet cheroot previous to attending the Colonel at the orderly room, and he was apparently lost in thought. Leonard Strudwick was young for a Captain, having been lucky in his promotions; but the careworn look on his face implied that he had perhaps 'lived' as much as men twice his age. He was the younger son of a not too wealthy baronet, and though he had expectations from a rich uncle, his means for the present were narrow—far too narrow, he thought himself—for a young man with expensive tastes in an expensive regiment.

The colour-sergeant of his company came into the veranda where he was sitting, and saluted. 'Private Golding would like to see you, sir, before he is brought before the Colonel,' said the sergeant.

'Certainly,' said Captain Strudwick. 'I will visit him at once. Let's see; he is the man who was on sentry when the mess was robbed—is he not?'

'Yes, sir,' replied the sergeant; and he went on, with the privileged out-spokenness of a tried and trusted old soldier: 'Rather severe of the Colonel to put him under arrest, sir, I think. He swears he saw no one about till he fired his rifle, and he couldn't be blamed for missing the man in that light. He's the most respectable man in the company.—You knew him at home, sir, I think, you told me?'

'Yes,' said the Captain; 'he comes from my village. I don't believe he is to blame, but you know what the chief is. Bound to go for somebody. However, he will have cooled by now, and I daresay I can make it all right for Golding. I'll come and see him at once.'

The sergeant returned to the barracks; and Captain Strudwick shortly followed him across the parade ground towards the guardroom where Golding was confined. He entered the prisoner's cell, and the moment the sergeant of the guard had retired, the private burst into tears.

'Come, man, don't take it to heart like that,' said the Captain. 'There's nothing for you to fear; the Colonel merely put you under arrest because he was in a rage. There's nothing against you: you're sure to be released.'

'It's not that, sir,' said Golding. 'Believe me, I'd bear anything if it would be of any use. Do you think I have forgotten little Sister Daisy and the burning house? No, sir; it's no fear of anything that is to happen to me. But, sir, robbery! They tell me the Waterloo centre-piece is gone. I never thought it was to be robbery, sir, so help me God, or not even the remembrance of little Daisy's danger would have made me agree to it. Don't say—don't tell me, Mr Leonard, sir, that it is too late. It can be put back; it must be found and put back somehow. Think of my lady, sir, and her so fond of you and praying for you over in England there; it would break her heart.'

'My dear lad, I wish you had mentioned my

mother yesterday,' said Strudwick; 'it might have prevented— But there, you thought, when I told you what to do, the whole thing was to be a joke, didn't you?'

'I did, sir—just a practical joke to pull Lieutenant Holbrook out of his bed. I'd never have done it else. Mr Leonard, you've dragged me into this unawares; but I don't ask anything for my sake—but for your mother's, sir, and your own. On your honour, sir, it shall go back—shan't it?'

'It shall, Golding,' said the Captain. 'I promise you that, whatever may be the consequences to me. It shall go back before twenty-four hours are past; and Sammy, my boy, thank you for saving me from a worse danger than ever little Daisy was in.'

Captain Strudwick wrung the private's hand and left the cell, first calling the sergeant of the guard to lock the door again.

'Your Captain is a good sort, Golding,' said the non-commissioned officer; 'he has cheered you up like one o'clock.'

'He has cheered me, indeed,' said Golding.

'That's right. I knew you were taking on more than the occasion required. You couldn't help the nigger stealing the plate.—Here comes the escort. Fall in the prisoners,' and in five minutes Private Golding was in the orderly room listening to a mild lecture from the Colonel to the effect that if he had kept his eyes about him he would have seen the robber entering the mess bungalow as well as leaving it. However, his Captain gave him a good character, and he would merely sentence him to be confined to barracks for three days.

After the proceedings before the Colonel were over, and Golding had been released from arrest on the understanding that he did not go beyond the confines of the parade ground till his three days were up, Captain Strudwick returned to his quarters. His bungalow was the last but one in the row, but he could see it plainly a long time before he reached his compound. Under the portico which abutted from the veranda stood a *shigram*, as the ramshackle four-wheel Indian cabs are called, and in the act of descending from the sorry conveyance were a couple of portly natives, whose rich turbans proclaimed them to be members of the *Baniah* or money-lending caste.

'Just as I expected,' murmured Strudwick to himself; 'the beggars are up to time; but I'll keep my word to Golding, let them do what they will.'

He mounted the steps to the veranda, and the two Hindus made low obeisance.

'Come in here,' said Strudwick, entering his sitting-room, whither he was followed by his visitors. The Captain threw himself into a low cane-chair and gloomily awaited their pleasure.

The eldest *Baniah* opened the campaign. 'The Sahib has procured "it" for us?' he asked with an oily smile.

'No; I have not,' said Strudwick shortly.

'The Sahib is joking,' replied the Hindu. 'We heard in the bazaar this morning that "it" had been removed from its usual place.'

'I can't help that,' said Strudwick. 'You shouldn't believe every lying bazaar rumour you hear.'

'But this was no rumour,' persisted the money-lender. 'The Sahib, who cannot have forgotten, knows that he arranged for us to have "it" as a set-off to the bill which he cannot meet. We will treat the Sahib honourably, and give him the balance over the amount of his bill.'

'I tell you I don't know what you mean,' said Strudwick. 'I only know this much—that I owe you two rascals twenty thousand rupees—nearly two thousand pounds English money—and that I can't pay you a halfpenny of it. You must do your worst.'

The Hindu's eyes glittered with rage and disappointment. He turned to leave the room, followed by his partner, both of them dispensing with the customary salaam. Strudwick moved wearily in his chair, and his eyes fell upon two letters lying on the table, hitherto unnoticed.

'The English mail, by Jove!' he exclaimed: 'one from the mother, and another from— No; I don't know the writing. I'll open it first, for luck.' He tore open the envelope, and read as follows:

LINCOLN'S INN FIELDS,
June 21, 1890.

DEAR SIR—We beg to inform you that your late uncle, Mr Michael Scarsdale, of whose death you will have been informed by your friends, has made you his residuary legatee. It is impossible at present to say what the various securities will realise, but the sum to come to you will not be less than £500,000. We enclose a draft for £5000 in case you have any matters to arrange, and should advise your speedy return to England to instruct us as to these large interests.—We are, dear Sir, yours faithfully,

TEMPLE, GRIFFIN, & Co., Solicitors.

Strudwick rushed to the door. The *shigram* with the two Hindus was in the act of starting. 'Come back here,' he shouted—'come back, and take your money.'

The *Baniahs* remembered their salaams when they re-entered Strudwick's room, this time. The Captain sat down to his table and wrote a cheque for the amount of the bill. 'If you take that to the branch of the Bank of India in an hour, it will be duly honoured,' he said. 'And now, hand me over the bill.—That is right,' he added, glancing at the dirty bit of stamped parchment which the *Baniah* produced.—'And now, clear out of this double-quick, and never let me see your faces again.'

The Hindus, with wonderment written large on their wily faces, made for the door, whispering to each other congratulations on their good luck, mixed with conjectures as to the whereabouts of the mysterious 'it.' When they were gone, Strudwick opened his mother's letter, which confirmed the lawyers' news about his uncle's death. It ended thus: 'You are a rich man now, Leonard dear, and I cannot be too thankful that it is so, knowing what temptations a poor man in the position you have filled has to face. But I am sure that my boy has faced them bravely, and that he will be able to look back upon his time of trial with pride. You must come home to us now, and when you come, mind you bring young Sam Golding with you. He will make an excellent servant for you, and he has always been

devoted to your interests since you saved his baby sister's life in that dreadful fire.'

Strudwick folded the letter and burst into tears. 'If she only knew—if she only knew!' he sobbed, rent well-nigh asunder with the mingled emotions of joy and repentance.

The next morning a score of the officers of the Marlshire regiment were sitting in the veranda of the mess bungalow, still bewailing the loss of the centre-piece. Suddenly a horseman appeared far out on the plain, galloping at full speed towards them.

'It looks like Strudwick,' said the Colonel. 'He's going uncommon fast, whoever it is.'

In two minutes the horseman reached the mess-house, his horse in a lather of foam. 'The centre-piece—the centre-piece!' he shouted half hysterically; 'I've found it—out on the plain yonder.'

'Where? How?' asked twenty voices.

'I went for a morning ride; and when I had got about a mile away, I saw the glitter of gold behind a sage-bush, and there, sure enough, was the centre-piece. It was too heavy to carry comfortably on horseback. We had better go and fetch it in at once.'

As the procession returned in triumph with the centre-piece proudly borne in their midst, the Colonel turned to his senior Major and remarked: 'The sentry must have hit the thief of a nigger and made him drop it, after all. And yet there are fools who write to the papers to say that our lads can't shoot straight.'

'Yes,' said the Major; 'it ought to be known that a Marlshire man fetched over his game at a distance of three-quarters of a mile.'

Private Samuel Golding promptly had the remainder of his three days' sentence remitted by the Colonel, and shortly afterwards sailed for England with his young master. But whenever he meets an old comrade disposed to talk about his wonderful shooting feat, he avoids the subject; and the true story of how the Waterloo centre-piece came to be found on the plain will always remain a Regimental Mystery.

QUAILS AND LOCUSTS.

THE French journal called the *Éleveur* (that is, Breeder) publishes an article about the 'Traffic in Quails,' which the writer criticises from an entirely new point of view. The correspondent of the *Éleveur* in a great measure attributes the enormous increase of locusts, from which the Algerian colonists have so fearfully suffered last year, to the cupidity and greed of gain of a few dealers in poultry. Since a great part of Northern Africa has fallen into the possession of the French, hunting and shooting have been practised there practically without let or hindrance of any kind. In consequence of this, the Sahara ostrich, the Carthaginian hen, and the smaller bustards, partridges, quails, and others have all become so scarce that, as a hunting-ground, Algeria—of which Generals Daumas and Marguerite, as well as Commander Garnier, have given us such glowing descriptions—has now dwindled down to a mere appendage or supplementary hunting-ground of Provence, in France. And yet people are sur-

prised at the vast and alarming increase of the destructive insect! The writer concludes with the following statistical remarks. 'A quail,' he says, 'consumes daily fifty to sixty grammes of food; and twenty tiny locusts of the size of a hemp-seed go to a gramme.' Hence it follows that, according to his calculations, one quail alone devours daily one thousand locusts, and therefore twenty to twenty-five thousand during the period in which these insects are small enough to be swallowed by a quail.

The Tunisian sportsmen who, on the 8th of May last year, shipped off 50,000 quails to France, are, then, in a great measure to blame for the fact of one hundred and fifty millions of locusts less than usual having been destroyed by these birds within the year.

In the stomach of an ostrich 4228 different substances were found, which consisted of remains of food, sand, small stones, &c. Now, even if we assume that among these there were only two kilogrammes of nutritive matter, yet a single ostrich would consume daily forty thousand locusts. These useful birds, which are often captured merely for the sake of their feathers, are so fond of locusts that they pick them out even from the dung of the camel.

WAITING.

I AM waiting alone while shadows grow,
And the light in the west departeth slow,
Waiting, while breezes come and go,
In the sunset glow.

A rosebud gleams through the failing light,
Just the ghost of a rosebud, pure and white,
In its heart a glistening dewdrop bright—
Will he come to-night?

'I will come to you when the sun gleams red
O'er the golden sea in the west,' he said;
Alas! the sun has already fled,
And the day is dead.

The sea gleams gray 'neath the twilight sky,
The seagulls homeward wheeling fly
To their nests on the cliff-side, bare and high,
And still wait I.

He is tarrying yet upon his way,
Tarrying he, while I wait and pray
At the garden gate, 'neath the rose's spray,
Where the moonbeams play.

Ah! how the perfume of that rose
Amid the silence heavy grows!
The wand'ring night-wind scarcely blows
In the dread repose.

'I will come,' he said. Ah! Love, come now,
For Time flies fast, I know not how.
I wait beneath the rose's bough,
But where art thou?

THE OSTRICHES AT THE ZOO.

By FRANK E. BEDDARD, M.A.

AT the moment of writing, all the different kinds of Struthious or Ostrich-like birds may be seen at the Zoological Gardens. It is not often, if indeed it has ever happened, that *all* these wingless birds are on view at once. Unfortunately, the exigencies of space forbid their being placed close together. If this could be arranged, they would form collectively one of the most striking exhibits in the whole Gardens. These birds live very well in confinement; and if visitors do not supply them with too liberal offerings of copper coins, to satisfy themselves of the truth of certain stories, there is no reason to prevent their living a good many years.

The reputation which, unluckily for the Zoological Society, the ostrich has of leaning towards pennies as an article of diet, has on more than one occasion led to the death of a valuable bird. From the stomach of one ostrich exactly fourpence-halfpenny was extracted. It is not surprising to learn that the creature died with symptoms of copper-poisoning. The real explanation of the alleged omnivorous tastes of these birds is the fact that they are obliged to pick up stones for their gizzard to help them in grinding their food. In civilised countries, other objects are frequently mingled with the pebbles; hence the very varied assortment of articles that are met with in their interior.

The ostrich itself is only represented by a single specimen; this is, however, somewhat of a rarity; it is not the common form, but the Somaliland species. This bird has never before been exhibited alive. Perhaps it is not altogether a misfortune for the ostrich that it has to lead a solitary life. Among ostriches, marriage does not always appear to be a success—at least among ostriches in confinement. When the Zoological Gardens were first opened, more than sixty years ago, there was a fine pair of the common form. The male bird had got a twist in the neck, owing, it was

believed, to a previous attempt at swallowing something too hard or too bulky even for an ostrich. His mate, instead of showing sympathy with him in his misfortune, persecuted and worried him to such an extent, that ultimately a judicial separation was decreed; the husband was literally henpecked. This incident does not seem altogether to fit in with the fact that the ostrich is often, if not as a rule, a polygamist. Perhaps, however, the male bird finds safety in numbers, and has taken to heart the saying, 'Divide et impera.' The traveller Levallant, whose veracity, it must be admitted, was not always on a par with his ability as a naturalist, distinctly allows that the bird may be polygamous. He also said, and this has been often confirmed, that the male takes a fair share of the duty of sitting upon the eggs.

In most birds, this is of course left to the hens. The ostrich is, however, by no means singular in this domestic habit; the Cassowaries and the Emus also relieve the laborious duties of their spouses. The cassowary is represented in the Gardens by several examples; this bird indeed is always well represented at the Zoo. The most curious points that strike the observer about the cassowary are the long spines upon the wings, and the bright colours—red and blue—on the neck. All the Struthious birds, without exception, have lost the art of flying; their wings have dwindled to tiny appendages, which cannot always be seen without a careful search. And yet the bones of the wing are there, and just as complete, except in point of size, as in the Frigate-bird, which represents the 'triumph of the wing.' The feathers of the wings have shrunk also in correspondence with the loss of flying power, but in various ways: in the ostrich, the rhea, the emu, and the apteryx, they have simply got smaller and smaller; in the cassowary they have not got smaller, but the branches of the strong feathers of the wing—the barbs, as they are called—have vanished, leaving behind only the quill. These quills are strong and sharp: useless to perform their original function,

they have become converted into organs of offence and defence; the cassowary makes use of them in fighting. We often find instances of this kind in the animal world; Nature is a great economist; when an organ, which was originally created for one purpose, has lost its usefulness, it is often—so to speak—patched up and altered to do duty in quite a different way.

The brilliant hues about the throat of these birds are very remarkable. The cassowary is so exceedingly sombre in its colouring—black or brown, brown when young—as to suggest that it reaps the reward of its scorn of a more brilliant dress, by remaining invisible to its foes in the darkness of its native forests. The structure of the cassowary—the wings particularly—proves incontestably that it is descended from a flying bird; possibly, therefore, the gaudy tints on the throat are the last reminiscence of former days when it was clad in more glorious apparel, like many tropical birds. On the other hand, the different species of cassowary, of which there are a dozen or so, present certain recognisable variation in the colours and wattles upon the neck; these differences not only enable zoologists to distinguish the kinds from each other; they may also permit the species to recognise each other, and so prevent infertile crossing. This is perhaps an illustration of a principle which, Mr Wallace thinks, is very general in nature: the existence of 'recognition marks,' which prevent an animal from making overtures to an unsuitable mate. The only objection to this is, that it endows the cassowary—a bird decidedly not remarkable for the brightness of its intellect—with powers of observation certainly not possessed by the average visitor to the Zoo, and even enviable by some naturalists.

If the cassowaries were provided with a larger pool of water, we might have a chance of verifying the truth or the reverse of a slightly incredible story which has been told about them. An Australian traveller happened to observe a cassowary from the opposite side of a 'creek,' with a view, no doubt, to ultimately getting a shot at it. The bird presently stepped into the water, and squatted down for a few minutes. This of itself was an unusual proceeding for so purely a land-fowl—*Cursores*, or runners, was the name given to this group by some of the earlier naturalists; but the sequel is stranger still. After quietly staying in the water for some moments, the bird stood up, and walked out on to the bank. Arrived there, it shook its wings, when out dropped a multitude of tiny fishes. These it proceeded to pick up and to eat. The idea is that the fishes mistook the stringy feathers of the bird for weeds; and only discovered their mistake when too late. It is necessary, however, to assume, whether there is evidence or not, that the cassowary can, on an emergency at any rate, take to the water. Cassowaries are found in some of the islands lying to the north of the Australian Continent. Now, these islands are, many of them, divided from the mainland by such deep channels that it is unlikely that they were ever connected. Besides, they are in great part or entirely volcanic in origin; so that there could not have been a bridge to allow the cassowaries to walk at their ease from one to the other. At one time or

another, therefore, these flightless birds must have voluntarily set out for a swim, and left their native shores. We cannot think that the separation took place before they had lost the power of flight, because in that case there would be greater differences between the species than there are. Isolation for such countless generations would have left its mark.

Close to the cassowaries are several examples of the New Zealand Apteryx. These birds, which are the representatives of the great extinct Moas, are next to them the most thoroughly degenerate of all the Struthious birds. Their wings are so tiny as to be quite hidden by the covering of feathers; and they have no counterbalancing advantages, such as size or strength. How they have managed to drag on an existence with such an unpromising equipment for the battle of life, would be a mystery if they inhabited any other country than New Zealand. New Zealand, however, is an excellent place for an unprotected creature of this kind to dwell in. Beyond a harmless bat or two, and perhaps a rat, there are no Mammals of any sort; the apteryx, therefore, has not to maintain an unequal contest with fierce carnivorous beasts, and attempt to dispute with them the right of existence. It has thus been able to lead a comparatively peaceful life, occasionally, perhaps, rendered exciting by a battle with an unusually large owl. The apteryxes at the Zoo are not often visible, by reason of their nocturnal habits. Only when the evening is well advanced do they issue forth, and commence their main business in life, which is to get as many earthworms as possible. Their long, soft, and sensitive bills enable them to probe deep into the soil in quest of their prey. A story was at one time current about the apteryx which fitted in with its antipodean habitat, where everything is supposed to be topsy-turvy. The bird, it was said, constructed a nest with a cavity below, into which it crept, and incubated the eggs from below instead of from above. But some apteryxes which constructed a nest at the Zoological Gardens effectually disproved this extraordinary tale.

The most graceful by far of all the Ostrich tribe is the American Rhea; and it is the least degraded of the lot; not, it should be explained, in manners and customs, but in structure. It is nearer to the flying ancestor than any of the others. The rhea is undoubtedly the most elegant of the Struthious birds in appearance; it is lightly built, of a pleasing gray colour, and graceful in its movements. The rhea is confined to South America, and inhabits the grassy pampas. In spite of its size and the bare character of the country which it prefers, the rhea is not at all a conspicuous bird. Mr Graham Kerr, who accompanied the ill-fated 'Pilcomayo Expedition,' told the Zoological Society a few weeks since of his experiences in hunting the American ostrich. The Indians who were with him without any apparent reason spread themselves out into a circle, intimating that one of these birds was in the midst of them; but it was not until the bird gave unequivocal signs of its presence by a movement that it was detected. Crouching down upon the ground, the grayish-brown feathers suggest a tuft of withered grass. If this is approached, the long neck and hissing head are

protruded, which possibly remind the assailant of a snake, or at least cause an involuntary recoil, during which the ostrich hastily takes its departure.

The last kind of ostrich-like bird is the Emu. This bird is literally a ventriloquist; for its long windpipe has a sac attached to it, which aids in the peculiar drumming sound which it makes. The emu, however, unlike the cicada, cannot be regarded as happy, through having a voiceless wife. The hen-bird no less than the cock makes the drumming sound, which is so difficult to localise. But the note is rather different in the two sexes; it is a sharper, more rattling sound in the male bird.

There are always examples of these birds at the Zoo; for they are particularly hardy. A few years since there was one in the Deer Park of Magdalen College, Oxford. Though a young bird, it could hold its own in the most satisfactory fashion with the largest and fiercest of the stags, who always gave it a wide berth. The emu agrees with the cassowaries in producing a dark-green egg; and it has the same development of bright-coloured patches about the neck. The ostrich, rhea, and apteryx lay a whitish egg.

THE IVORY GATE.*

By WALTER BESANT.

CHAPTER XVI.—WHO IS EDMUND GRAY?

ATHELSTAN laughed on the first hearing of the thing—it was on the Tuesday evening, the day after the discovery, and George was dining with him. He laughed both loud and long and with some of the old bitterness. ‘So the notes were in the safe all along, were they? Who put them there? “I,” says old Checkley, “with my pretty fingers—I put them there.”’

‘As soon as this other business is over, the Chief must tell your mother, Athelstan. It ought to come from her. I shall say nothing to Elsie just yet. She shall learn that you are home again, and that your name is clear again, at the same moment.’

‘I confess that I should be pleased to make them all confess that their suspicions were hasty and unfounded. At the same time, I did wrong to go away; I ought to have stuck to my post. As for this other business, one thinks with something like satisfaction of the wise old lawyer losing forty thousand pounds. It made him sit up, did it? For such a man to sit up indicates the presence of deep emotion. Lost forty thousand pounds! And he who holds so strongly to the sanctity of Property! Forty thousand pounds!’

‘Well; but we shall recover the certificates, or get new ones in their place.’

‘I suppose so. Shares can’t be lost or stolen, really—can they? Meantime, there may be difficulty, and you must try to find the forger. Has it yet occurred to you that Checkley is the only man who has had control of the letters and access at all times to the office?’

‘It has.’

‘Checkley is not exactly a fox: he is a jackal:

therefore he does somebody’s dirty work for him at a wage. That is the way with the jackal, you know. Eight years ago he tried to make a little pile by a little forgery—he did not commit the forgery, I am sure—but he did the jackal; only he forgot that notes are numbered: so when he remembered that, he put them back. Now, his friend the forger, who is no doubt a begging-letter writer, has devised an elaborate scheme for getting hold of shares—ignorant that they are of no value.’

‘Well, he has drawn the dividends for four months.’

‘That is something, you see; but he hoped to get hold of thirty-eight thousand pounds. It is the same hand at work, you infer from the writing. You are quite sure of that?’

‘There can be no doubt of it. How could two different hands present exactly the same curious singularities?’

‘And all the letters, cheques, and transfers for the same person. What is his name?’

‘One Edmund Gray, resident at 22 South Square, Gray’s Inn.’

‘No. 22? Oh! that is where Freddy Carstone lives. Do you know anything about the *nommé* Edmund Gray?’

‘I have been in search of information about him. He is described by the landlord of the rooms and by his laundress as an elderly gentleman.’

‘Elderly. Checkley is elderly.’

‘Yes, I thought of Checkley, of course. But somehow the indications don’t fit. My informants speak of a gentleman. Nobody at his kindest and most benevolent mood could possibly call Checkley a gentleman.’

‘The word gentleman,’ said Athelstan, ‘is elastic. It stretches with the employer or the consumer of it. It is like the word truth to a politician. It varies from man to man. You cannot lay down any definition of the word gentleman.—Do you know nothing more about him?’

‘A little. He has held this set of Chambers for nine years, and he pays his rent regularly before the day it falls due. Also I called upon him the other day when his laundress was at work and wrote a note to him at his table. The room is full of Socialist books and pamphlets. He is therefore, presumably, a Socialist leader.’

‘I know all their leaders,’ said Athelstan the Journalist. ‘I’ve made the acquaintance of most for business purposes. I’ve had to read up the Socialist Literature and to make the acquaintance of their chiefs. There is no Edmund Gray among them.—Stay—there is a Socialist letter in the *Times* of to-day—surely—Waiter—they were dining at the club where Athelstan was a temporary member—‘let me have the *Times* of to-day.—Yes, I thought so. Here is a letter from the Socialist point of view, signed by Edmund Gray—and—and—yes—look here—it is most curious—with the same address—22 South Square—a long letter, in small print, and put in the supplement; but it’s there.—See; signed Edmund Gray.—What do you think of that, for impudence in a forger?’

George read the letter through carefully. It was a whole column long; and it was in advocacy of Socialism pure and simple. One was surprised

* Copyright 1892 in the United States of America by Harper & Brothers.

that the editor had allowed it to appear. Probably he was influenced by the tone of it, which was generous, cheerful, and optimistic. There was not the slightest ring of bitterness about it. 'We who look,' it said, 'for the coming disappearance of Property, not by violence and revolution, but by a rapid process of decay and wasting away, regard the present position of the holders of Property with the greatest satisfaction. Everywhere there are encouraging signs. Money which formerly obtained five per cent. now yields no more than half that rate. Shares which were formerly paying ten, twelve, and twenty per cent. are now falling steadily. Companies started every day in the despairing hope of the old great gains, fail and are wound up. Land, which the old wars forced up to an extraordinary value, has now sunk so enormously that many landlords have lost three-fourths and even more of their income. All those enterprises which require the employment of many hands—as docks, railways, printing-houses, manufactories of all kinds—are rapidly falling into the condition of being able to pay no dividend at all, because the pay of the men and the maintenance of the plant absorb all. When that point is reached, the whole capital—the millions—embarked in these enterprises will be lost for ever. The stock cannot be sold because it produces nothing: it has vanished. In other words, sir, what I desire to point out to your readers is that while they are discussing or denouncing Socialism, the one condition which makes Socialism possible and necessary is actually coming upon the world—namely, the destruction of capital. Why have not men in all ages combined to work for themselves? Because capital has prevented them. When there is no capital left to employ them, to bully them, to make laws against their combinations, or to bribe them, they will then have to work with and for themselves or starve. The thing will be forced upon them. Work will be a necessity for everybody: there will be no more a privileged class: all who work will be paid at equal rates for their work: those who refuse to work will be suffered to starve.'

The letter went on to give illustrations of the enormous losses in capital during the last fifteen years, when the shrinkage began. It concluded: 'For my own part, I confess that the prospect of the future fills me with satisfaction. No more young men idle, middle-aged men pampered, and old men looking back to a wasted life: nobody trying to save, because the future of the old, the widows, the children, the decayed, and the helpless, will be a charge upon the strong and the young—that is, upon the *juvenes*, the workers of the State. No more robbery: no more unproductive classes. Do not think that there will be no more men of science and of learning. These, too, will be considered workers. Or no more poets, dramatists, artists, novelists. These, too, will be considered workers. And do not fear the coming of that time. It is stealing upon us as surely, as certainly, as the decay of the powers in old age. Doubt not that when it comes we shall have become well prepared for it. Those of us who are old may lament that we shall not live to see the day when the last shred of property is cast into the common hoard. Those of us who are young have all the more reason to rejoice in their youth, because they may live to see the

Great Day of Humanity dawn at last.—EDMUND GRAY, 22 South Square, Gray's Inn.'

'You have read this?' asked George.

'Yes; I read it this morning before I knew the significance of the signature. Letter of a dreamer. He sees what might happen, and thinks that it will happen. Capital is too strong yet.'

'Is this the letter of a forger, a conspirator—a thief?'

'It does not strike me in that light. Yet many great thieves are most amiable in their private lives. There is no reason why this dreamer of dreams should not be also a forger and a thief. Still, the case would be remarkable, I admit.'

'Can there be two Edmund Grays—father and son?'

'Can there be a clerk to Edmund Gray, imprudently using his master's name, and ready to open any letter that may come? Consider—Clerk is a friend of old Checkley. Clerk invents the scheme. Checkley does his share. However, we can easily find out something more about the man, because my old friend, Freddy Carstone, has Chambers on the same floor. We will walk over after dinner, and if Freddy happens to be sober—he is about this time pleasantly, not stupidly, drunk, as a rule—he will tell us what he knows about his neighbour.'

'I ought to see Elsie this evening, but this is more important.'

'Much more. Send her a telegram.—Waiter, we will take coffee here. So. You have got the conduct of the case in your own hands. What has Checkley got?'

'Nothing. I believe he is jealous of me. I don't know why. But it does not matter what an old man like that thinks.'

'Even an old man can strike a match and light a fire. Checkley is a malignant old man. He is quite capable of charging you with the job. I wonder he hasn't done it by this time. Remember my case, old man.' Athelstan's face darkened at the recollection. 'Dirt sticks sometimes. Look at me. I am smirched all over.'

'His manner was very odd this morning—insolent and strange. He began to talk mysteriously of the ingratitude of the forger.'

'Why, he's actually going to do it! Don't you see—he means that you are the forger?'

'Oh! does he? Very well, Athelstan'—George finished his coffee and got up—'the sooner we find out this mystery of this Edmund Gray the better. Let us seek your tipsy Scholar.'

They walked from Piccadilly to Holborn, turning the thing over and making a dozen surmises. Edmund Gray, twins: Edmund Gray, father and son—father wanting to destroy property, a Socialist; son wanting to steal property, individualist: Edmund Gray cousins—one the mild philosopher, rejoicing in the decay of wealth; the other a bandit, robber, and conspirator: Edmund Gray, father and daughter—the young lady of the advanced type, who has not only thrown over her religion but her morals also: Edmund Gray, master and clerk: Edmund Gray under domination of a villain: there was in every situation a noble chance for the imagination. George showed a capacity unsuspected: he should have been a novelist. The hypothesis was always beautiful and admirable: but it wanted one thing

—*vraisemblance*: one felt, even while advancing and defending one, that it was impossible.

They turned into the Gateway of the Inn and walked down the passage into the Square. 'Look!' Athelstan caught his companion by the wrist. 'Who is that?'

'Checkley himself. He is coming out of No. 22.'

'Yes, out of 22. What is he doing there? Eh? What has he been doing there?'

It was Checkley. The old man walking feebly, with bent head, came out from the entrance of No. 22 and turned northward into Field Court. They waited, watching him, until he left the Square. 'What is he doing there?' asked George again. 'Come. Edmund Gray must be at home. Let us go up.'

They found the outer door shut. They knocked with their sticks: there was no answer.

'What was he doing here?' asked Athelstan.

The Scholar's door stood open. The Scholar himself was for once perfectly sober, and welcomed them joyously and boisterously.

'We are here on business, Freddy,' said Athelstan.

'You are here to sit and talk and drink whisky-and-soda till midnight, till two o'clock in the morning. It is not until two in the morning that you can get the full flavour of the Inn. It is like a college then, monastic, shut off from the world, peaceful'—

'Business first, then. You know your neighbour, Mr Edmund Gray?'

'Certainly. We exchange the compliments of the season and the news of the weather when we meet on the stairs. He has been in here, but not often. A man who drinks nothing is your true damper. That, believe me, and no other, was the veritable skeleton at the Feast.'

'Our business concerns your neighbour, Mr Edmund Gray. We want you to tell us what you know about him.'

'Go on, then. Question, and I will answer, if I can.'

'Does Mr Edmund Gray live at these Chambers?'

'No. He may sometimes sleep in them, but I should say not often. He calls at irregular intervals. Sometimes in the afternoon, sometimes in the morning, sometimes not for several weeks together. He is most uncertain.'

'Do many people call upon him?'

'No one ever calls upon him.'

'Does he keep clerks? Does he carry on an extensive correspondence?'

'I have never heard the postman knock at his door.'

'Has he a son or a brother or a partner or anything?'

'I don't know. He may have these hindrances, but they are not apparent.'

'What is his occupation or trade?'

'He is a Socialist. He is athirst for the destruction of property. Meantime, I believe, he lives on his own. Perhaps his will be spared to the end. He is an old gentleman of pleasant manners and of benevolent aspect. The old women beg of him: the children ask him the time: the people who have lost their way apply to him. He dreams all the time: he lives in a world impossible. Oh! quite impossible. Why, in a

world all Socialist, I myself should be impossible. They wouldn't have me. My old friend told me the other day that I should not be tolerated. They would kill me. All because I do no work—or next to none.'

George looked at Athelstan. 'We are farther off than ever,' he said.

'Mr Edmund Gray believes that the Kingdom of Heaven is a kind of hive where everybody has got to work with enormous zeal, and where nobody owns anything. Also he thinks that it is close at hand, which makes him a very happy old gentleman.'

'This can't be Checkley,' said George.

'It would seem not,' Athelstan replied. 'Did you ever see another old man up here—we saw him coming out just now—one Checkley, a lawyer's clerk?'

'No; not up here. There is an elderly person—a Party—of the name who uses the parlour of the *Salutation* where I myself sometimes—one must relax—Porson loved a tavern; so did Johnson—I myself, I say, sometimes forget that I used to belong to the Combination room, and sit with Checkley and his companions. But I do not think he is a friend of Mr Gray. As well call the Verger the friend of the Bishop. Mr Gray is a gentleman and a scholar; he is a man of generous instincts and culture. He *could* not be a friend of the man Checkley.'

'Yet we saw Checkley coming out of this very staircase.'

They talked of other things. They talked till midnight; when they came away the Scholar was at his best: one more glass—which he took after they left—would have turned the best into the worst.

'We are as far off as before,' said George.

'No—we are so much the nearer that we know who Edmund Gray is not. He is not Checkley. He has no clerks. He has no visitors. He comes seldom. George, this looks to me suspicious. We met Checkley stealing out of the door. Why does Edmund Gray keep these Chambers? No business done there: no letters brought there: no callers: the man does not live there. The Socialism may be—must be—a blind. Why does the man keep on these Chambers?'

Meantime at the *Salutation* the usual company was assembled. 'I fear,' said the barrister, 'that we shall not have our friend the Scholar here this evening. As I came down the stairs I saw him opening his door to two gentlemen—young gentlemen. He will display his wonted hospitality upon them this evening instead.' He sighed, and called for the glass of old and mild mixed, which was all he could afford. Had the Scholar been with them, certainly there would have been a nobler and a costlier glass. He took up the morning paper and began to read it.

The conversation went on slowly and with jerks. A dull conversation: a conversation of men without ideas: a day before yesterday conversation: the slow exchange of short, solid sentences taken from the paper, or overheard and adopted. We sometimes praise the old tavern life, and we regret the tavern talk. We need not: it was dull, gross, ignorant, and flat: it was commonplace and conventional: because it

was so dull, the men were fain to sing songs and to propose sentiments, and to drink more than was good for them. Why and when do men drink more than is good for them? First, when and because things are desperately dull: there is nothing to interest them: give them animation, thoughts, amusements, and they will not begin to drink. When they have begun, they will go on. When they have arrived at a certain stage, let them drink as fast as they can, and so get out of the way, because they will never mend, and they only cumber the earth. Here is, you see, a complete solution—a short solution—of the whole drink question. It will not be accepted, because people like a long solution—a three-column solution.

The barrister lifted his head. 'There is a letter here,' he said, interrupting the ex-M.P., who was clearing the way for what he called an argument by an introduction in the usual form. 'While on the one hand, gentlemen,' he was saying, 'I am free to confess'—

'There is a letter here,' he repeated in a louder voice. The barrister was now old, but he could still assume at times the masterful manner of counsel before the Court, 'which should be read. It is a letter on Socialism.'

'Ugh!' said the money-lender. 'Socialism! They want to destroy Property. Socialism! Don't tell me, sir.'

'It is a dream of what might be—a noble—a generous letter.' He looked round him. In their dull and fishy eyes there was no gleam or sparkle of response. 'I forgot,' he said; 'you cannot be interested in such a letter.—I beg your pardon, sir.' He bowed with great courtesy to the ex-M.P. 'I interrupted your valuable observations. We shall listen, I am sure, with—the—greatest'—He buried his head in the paper again.

The legislator began again. 'As I was a-saying, gentlemen, when I was interrupted, on the subject of education and the ratepayers, being a ratepayer myself, as we all are, and having our taxes to pay, which is the only advantage we ever get from being a ratepayer, while on the one hand I am free to confess'—

'Why!' the barrister interrupted once again, 'this letter is from a man on our staircase, No. 22'—Checkley started—'an acquaintance of mine, if I can call him so, and of our friend the Scholar. A very able man, now somewhat in years. By name Edmund Gray.'

'What?' said Checkley. 'Edmund Gray? You know Edmund Gray?'

'Certainly. I have known him this nine years. Ever since he has been in the Inn.'

'W-w-what sort of a man is he?' Checkley stammered in his eagerness.

'A very good sort of a man. Why do you ask?'

'I want to know—for his advantage—oh! yes—yes—for his own advantage.'

'Yes.' The barrister retreated to his paper. 'Oh yes,' he added. 'Quite so.'

'For his great personal advantage,' Checkley repeated.—'Robert, I think the gentleman would take a tumbler, if you will bring it—hot, Robert—strong—with lemon and sugar—a large rummer, Robert.'

The ancient barrister's head behind the paper was observed to tremble.

Robert returned with his rummer, the glass spoon tinkling an invitation. Dinner had been but a sorry affair that day—a stop-gap—insufficient in bulk; the tempted man felt a yearning that could not be resisted. He stretched out his hand and took the glass and tasted it. Then turning to Checkley.

'You have purchased my speech, sir. You were asking me about Mr Edmund Gray. What do you wish to know?'

'Everything—his business—his private life—anything.'

'As for his business, he has none: he is a gentleman living on his means—like myself; but his means are larger than my own: he has a residence elsewhere—I don't know where: he uses his Chambers but little: he has a collection of books there, and he keeps them for purposes of study.'

'Does he call there every day?'

'No. Only at irregular times. Sometimes not for many weeks together.'

'Has he got any friends?'

'I should say that he has no friends at all—at least none that come to the Inn. I have never heard or seen any one in his room. A quiet man. No slammer. An excellent man to have on the staircase. No trampler; doesn't tramp up and down like an elephant. Isn't brought home drunk.'

'What does he look like?'

'He is a man advanced in years—perhaps seventy—a good-looking man—very cheerful countenance: tall and well set up still—wears a long frock coat. And that I believe is all I know about him.'

'That's all you've got to tell me, is it?'

'That is all, Mr Checkley. Except that he has written a very remarkable letter to the *Times* of this morning.'

'Well, sir, if that is all, it isn't much for your rum-and-water, let me tell you.'

The barrister rose and poured the half-glass that remained into the ciders. 'Then let me drink no more than my information was worth,' he said; and at the sight of so much magnanimity the broad earth trembled and Mr Checkley sat aghast.

The ex-statesman cleared his throat and began again. 'After the third interruption, gentlemen, I may hope for a hearing. While, therefore, on the one hand'—

(To be continued.)

CAIRNGORM IN WINTER.

THE Caledonian 'Alps' afford ample scope for the exhilarating exercise of mountaineering during the summer months, and are not without charm to some during the winter season. Indeed, mountain excursions in mid-winter have now almost become fashionable, and the interest in Scottish hills is yearly increasing. For our New-Year holidays of 1892 Cairngorm was resolved on, that popular mountain having, according to our programme, to be crossed from Nethy Bridge, in Speyside, to Braemar, in Deeside. The weather was to be ignored, the arrangement being that, should the then prevalent snow-storm leave open

the railway route from Aberdeen to Nethy Bridge, the journey should be attempted.

As the train slowly made its way along the Spey from Craigellachie, the condition of the weather became a matter of no small interest to the little party of mountaineers who had equipped themselves for the occasion. For as darkness set in, fleecy flakes seemed at times to envelop the train, presaging soft snow on the mountains. When Nethy Bridge station was reached at 8.40 on the evening of the last day of 1891, Strathspey looked wintry enough, while the freshness of the weather bespoke a stiff day's work on the morrow. Our arrival seemed not altogether unexpected, a little crowd of villagers having assembled to discuss, among other things, our appearance and the probability of the success of our attempt. It was afterwards satisfactory to us to learn that we passed the scrutiny, the general remark being 'that fouk'll gang.' Our critics were men not given to unnecessary mountain-climbing in summer, and as for such feats in winter, they regarded them as a form of madness.

Dinner over, enjoyed as hillmen can, our plans were finally arranged, the alternative routes to Braemar, which the weather might necessitate, being carefully discussed. Tales of old battles with wind and snow, former ascents of the hills in the vicinity, and mountain-talk generally, drowned the death-moan of 1891, and swelled the birth-cry of 1892.

We had proposed starting at five A.M., but the vagaries of an alarm clock delayed us till seven. We contented ourselves with a biscuit and a tumbler of milk, being due for breakfast at the keeper's at Glenmore Lodge, at the upper end of Loch Morlich—the very base of Cairngorm. The weather was most unmistakably fresh, the snow being quite soft. Crossing the bridge over the Nethy, one could not avoid a look at the dark hurrying stream below, as the thought struck us, 'We have to trace you to your fountains ere our day's work is half done.' The forest of Abernethy entered, the snow became deeper, rendering walking proportionally difficult and slow. Forest Lodge passed, the road and the forest became more and more alike, sometimes indistinguishable. Wreaths were now numerous as Rynettin—not yet awake to the New Year—was neared; and that house behind us, a virgin road lay before. Our upward climb temporarily ended at Rebhoan, snow-wreath rapidly succeeding snow-wreath. Rebhoan, always lonely, seemed then a very centre of desolation, the only living thing visible being a wretched rabbit that made haste to hide itself. Here we left Strath Nethy, entering Glen More by the gorge known as 'the thieves' pass.' The upper part of this glen is much admired for its picturesqueness in summer; in mid-winter we found it magnificent. On our left were the steep slopes and crags of the northern base of Cairngorm; on the right, Meall a' Bhuachaille (the herd's hill), with its precipitous tree-clad side, where we observed a big herd of deer in search of food. It was not till after four hours' stiff steady walking that Glenmore Lodge was reached. A much shorter time under similar circumstances would have been sufficient to give a keen enough relish for breakfast. That meal over, the situation was considered anew. Noon approached; the weather was still

fresh, the almanac promised us no moon, and, judging from our rate of walking, the ascent of Cairngorm would consume the remaining hours of daylight. This would leave the more dangerous part of the journey to be traversed in darkness. The risk was deemed too great, and reluctantly it was decided to remain overnight at Glenmore Lodge. To put ourselves in better condition, we took a walk to Loch an Eilan—noted for the ospreys that nest in its ruined castle—some six miles distant. The route taken was by Auldrue, the Luineag being crossed by the sluice where that stream leaves Loch Morlich.

As we returned from our twelve-mile walk—thus making about twenty-four through soft snow, not bad training for the morrow—we heard the bagpipes playing at Glenmore Lodge. They 'made melodie' for a little band of dancers, who footed it with that fervour which characterises Highlanders when stimulated by the 'skirl' of their favourite musical instrument. We were treated to an excellent Gaelic song; it numbered about forty verses, but fortunately the singer remembered only about three-fourths of them. As we retired to bed, we could hear the snow falling from the roof, but the drone of the pipes soon lulled us to sleep.

We left Glenmore Lodge at 8.45 on the morning of the 2d. The weather was still fresh; about a foot of snow lay in the glen, 'silent as solitude's self.' All was white save dark Loch Morlich and the firs of Rothiemurchus and Glen More. A beautiful sunset the previous afternoon had augured well, and we had little apprehension of anything more severe than a toilsome trudge of some two dozen miles. True, the summit of Cairngorm was not visible—two thousand feet appeared to be the *upward* limit of vision—but that gave us little thought, as it is only during a sharp clear frost that mountain views may be looked for in winter. From Glenmore Lodge—the last 'fire'-house on the Inverness-shire side of Cairngorm—a capital path leads halfway up the mountain, but then it was of doubtful utility, heaped up as it was with snow. The nearest house on the Aberdeenshire side of the range is Derry Lodge, a shooting-box of the Duke of Fife's in Mar Forest. The path keeps for some distance by the Allt Mor—the principal feeder of Loch Morlich—which is crossed twice, the second time by a pony-bridge at a height of about fourteen hundred feet, and there the ascent really begins. On our departure from the Lodge the aneroid marked 28'8, the height being about eleven hundred feet; an hour after it showed 28'275, the altitude being sixteen hundred feet with the thermometer at thirty-eight degrees. At this height the fierceness and persistence of the storm had swept the mountain ridge almost bare; it looked indeed as though some giant sweeper had applied his broom rather carelessly over the hillside. Walking was therefore comparatively easy here. It may be incidentally mentioned that Cairngorm is the easiest of ascent at all times of any of the mountain tops of the range to which it gives name. The view upwards had gradually narrowed to about a hundred yards; but northwards and Speywards the prospect was magnificently Alpine, the range on the left bank of the Spey, known as the Monadh Liath, standing out in bold relief. The group of

mountains in the vicinity of Kingussie attracted attention, their white mantle rendering them particularly noticeable. Their death-like pallor was a strong contrast to the beautiful rose-tints they displayed at the going down of the yesterday's sun.

Attention, however, had now to be concentrated on personal matters, for, ere the two thousand-foot line—temperature thirty-seven degrees—was reached we were knee-deep in snow, and a strong westerly wind had to be reckoned with. Blowing on our right cheek, it necessitated considerable exertion and watchfulness to preserve the proper angle of ascent. When a height of two thousand six hundred feet was attained the thermometer had fallen another degree, and the wind had grown to a hurricane, steadily forcing us to the left. The prospect now was almost blank, for nothing could be seen beyond a few yards' radius. Deep as was the snow generally, the hurricane had cleaned the more exposed portion of the ridge almost bare, the heather peeping through and the larger stones being quite visible. We reached a height of three thousand feet in two hours, the aneroid marking 26·8; but the thermometer was gone. Suspended at a shoulder-strap, it had fallen an unobserved prey to the tempest.

At this stage, less experienced but more prudent mountaineers would probably have considered the advisability of retreat; but we had only one thought—to reach the cairn that marks the summit. We had anticipated striking it directly, but we had not sufficiently allowed for the deflection which the wind had forced us to make to the eastward. The cairn was therefore unconsciously passed on the right, and the descent begun towards Loch Avon before our blunder became apparent. There is no mistaking the summit of Cairngorm; so, after a brief retracing of steps, the cairn loomed out through the mist, and was reached at 11.40, about three hours after leaving Loch Morlich. We had reckoned on requiring four hours or so. The aneroid was back to 25·4, and showed on the mountain scale four thousand four hundred feet, while the height of Cairngorm is only four thousand and eighty-four feet. The barometer, we afterwards calculated, had fallen no less than three-tenths of an inch during the last hour, apart from the natural fall caused by the increasing altitude. This perhaps will give some slight idea of the weather on the summit—the wind blew pitilessly, and the cold was intensely penetrating. It was utterly out of the question to make any stay at the cairn; a halt of ten minutes there would have chilled away the whole natural caloric of our bodies. It need scarcely be said that there was no view; nothing could be seen save the cairn.

The fury of the weather left only one practicable route for the descent, for the blast could not be faced, tearing up as it did the icy crust of the snow and driving it in angular pellets against our faces. Turning our backs, therefore, to the wind, we made for the Garbh Allt, as the upper part of the Nethy is called—a rather ticklish route in winter. The slope of Cairngorm towards the Garbh Allt is steep, and, with hard snow, is impracticable without an ice-axe. With the snow soft, however, the descent was safe enough for experienced hillmen. Yet extreme caution

had to be used for the first seven hundred and fifty feet or so of the descent, as a very slight divergence in the mist might have been attended with serious consequences. By straying too far to the left, the terrible precipice known as the Eagle's Cliff would be encountered; while on the right there are the almost equally dangerous rocks that overlook 'the Saddle.' The descent, in Indian file, was necessarily somewhat tedious, frequently up to the knees in soft snow. 'The Marquis's Well' on the summit was of course not visible, and even that great mass of rock known as 'Margaret's Coffin' was passed unobserved. Ben Bynac is separated from Cairngorm by the Garbh Allt, and the deep gorge between these two mountains was the first natural feature recognisable. Then the sun struggled with the mist, giving us peeps of the summit of Beinn Mheadhoin, a huge mass, three thousand eight hundred and eighty-three feet in height, on the right bank of Loch Avon.

Now that our *mauvais quart d'heure* was over, we could feel grateful and indulge in a little conversation. We then held to the right for 'the Saddle,' where a short halt was made, the better to enjoy one of the grandest views among the Cairngorms—the great hollow that holds Loch Avon. The loch was covered with ice, except opposite the point where a burn, rising on the Loch Etchachan plateau, joins it on the right near the top. Loch Avon lies at a height of about two thousand four hundred feet, and is one of the most secluded sheets of water in Scotland. Far from all human habitation, it is girt about on three sides with giant mountains that, 'dark sentinels of the waste,' rise from its lonely shores. On the left is Cairngorm itself; on the right, Beinn Mheadhoin; and at the upper end is Ben Muich Dhui, the monarch of the range. The mountain-born torrents that feed it were all ice-bound and snow-covered and silent as the very grave. The universal stillness was a marked contrast to the storm raging above, and to the fierce tempests, that often, even in summer, tear through this gigantic gorge. Yet even here life appeared possible, for a mountain hare scudded before us on 'the Saddle,' and not a few ptarmigan winged their flight lazily along.

The heaviest part of the day's work had now to be faced—a toilsome walk round the head of the loch, and the steep ascent, in very soft snow, from the Shelter Stone to the Loch Etchachan plateau. A mile and a half an hour had latterly been counted good progress; now we could not manage more than a mile in the hour. An attempt was made to cross Loch Avon on the ice, and so save a considerable detour; but it was not sufficiently firm. The ice even on the Garbh Uisge (Rough Water, appropriately named), which enters the loch at the upper end, would not bear, so that burn had to be crossed about half a mile up by the aid of a wreath which sufficed as a bridge. This landed us near the Shelter Stone, through a wilderness of boulders and mountain-chips known in Gaelic as 'the Dairymaid's Field.' He must have been a Celt of peculiar humour who first applied the name. As the Shelter Stone was approached, a flock of nine ptarmigan quietly *walked* ahead of us at a distance of about half-a-dozen yards! The interior, if one may use the expression, of the

Stone was mostly filled up with snow. We partook of a little lunch inside, a stay of a quarter of an hour being sufficient in the circumstances. The ascent to Loch Etchachan was commenced at 2.45; and as it is at an altitude of about seven hundred feet higher than Loch Avon, it was found covered with bearing ice. The loch was almost indistinguishable from the plateau, the thick ice being roughly covered with snow. Here we were again in the storm; but fortunately it blew down Corrie Etchachan, which accordingly we took at a run, and so entered the well-known Glen Derry.

Oh weary, weary Glen Derry! How many tired and ready-to-faint young mountaineers have cursed you bitterly in their hearts, and vowed to avoid you in the future! Familiar as was the ground, the falling darkness and the treacherous snow kept every sense on the *qui-vive* for nearly two hours, as we carefully picked our way to Derry Lodge. The Lodge was a welcome sight, and a cup of tea from the 'guidwife' was much appreciated. After a halt of an hour, we resumed our walk to Castletown of Braemar. We had now a carriage road; but the first part of it was a good deal blocked up with snow. Our destination was reached in good form at 9.45 P.M.—thirteen hours after leaving Glen More.

Such winter ascents have a peculiar piquancy, and, perhaps not altogether without some little danger, offer great inducements to trained mountaineers, especially to those with some knowledge of the Swiss Alps. Only those who can thoroughly enjoy a long and severe tussle with the elements need, however, attempt these excursions; in a word, one must be in the best of health, and, moreover, some of the party must have an intimate knowledge of the ground to be traversed. Under any other circumstances, disaster would certainly be the result; but, with sound mind and sound body, a winter ascent of a mountain such as Cairngorm is the very pink of Scottish mountaineering.

A BOYCOTTED BABY.

CHAPTER V.—JEM'S WIFE AGAIN—HER LAST APPEARANCE.

THE agony of this suspense was wearing him out, and Matthew Bulbous felt, next morning, as if another twenty-four hours of it would drive him mad—unless, in self-preservation, he rushed off to the nearest police station and gave himself up in anticipation of the action of the law.

The house was intolerable, and he could not bear the disgrace of being arrested in the presence of all his clerks. So he made away from London by way of Victoria Station, unconsciously leaving the train when it stopped at Penge; and giving up his ticket at the gate, crossed the wooden bridge over the line, which he remembered crossing on the day of the funeral of his son's wife—Christmas Day. It seemed so long ago now.

Matthew Bulbous walked slowly down the street of Penge, heedless of pelting sleet and of the fact that he was without an umbrella. His head was bent in abstraction; but his feet, unconsciously, were bringing him step by step

towards the house in Croydon Road where, with most unchristian feeling, he had seen the hearse waiting for the dead woman. If it had to be done over again, he knew now how he would do it. Condone that marriage he could not, nor forgive his son for the act of defiance. But he recognised the hand of the good-fortune which had always attended his undertakings in the event which had first put an end to the matrimonial scheme between Lord Polonius and himself. Had he only recognised it at the time, he would never have suffered himself to fall into the Earl's hands again. He would have left things as they were. The baby would probably have died in any case, and he should be free of this terrible burden which crushed him now.

Then he went on to speculate as to what was probably at that very moment going on at the inquest. From this he proceeded further to speculate on the sentence he should be likely to receive—the ruin and shame he realised sufficiently well. It would be imprisonment with hard labour; for a year, or two years; or perhaps penal servitude for a longer term. And then? It was the coming to life again, rather than the imprisonment, which he dreaded most; and it is very likely that it would have been a relief to him to be assured, as he walked drenched and insensible to wet and cold down the dull suburban street, that he should be shut away from the world for ten or twenty years. What would not ten or twenty years wipe out? He might reappear in the world, at the end of that period, forgotten, and therefore less ashamed. But to come back soon—while the thing was still fresh in all men's minds—would, he knew, be the worst part of his punishment—a calamity that would be killing to a man of his unresting energy, who could not sit still and corrode in inactive obscurity.

At the bottom of the main street of Penge village there is a police station, at a corner where Croydon Road crosses at right angles. Matthew Bulbous stepped quickly off the pavement in front of the station, stooping his head against the driving and blinding sleet, in order to cross to the other side. He had gone but three paces when a shout from the door of the police station paralysed him, and heavy feet leaped down the stone steps and followed him. As the policeman's grasp was on his shoulder he turned his white face to his captor—was struck in the head and chest with tremendous force, and flung back senseless on the pavement.

For weeks after this occurrence, Matthew Bulbous was knocked out of the world more completely than he had been gloomily anticipating just before it happened, and by a much more summary process. The world he was shot into proved to be a strange and bewildering one, and held masterful grip of his raving fancies. It was a kind of world manifest enough, from his hallucinations, to those about him; but much of it was wholly incomprehensible, and almost all of it very dreadful.

How many times he was pilloried in the dock for that crime of folly, it would be impossible to say. The wretched man was being for ever put on his trial, with not a word of defence to

utter. Mr Clove sat by, silent and powerless; the loathsome Griffon, smelling of gin, with vile moisture glistening on the bristles round her mouth, supported him on one side; the doctor, on the other; and now and again he caught sight of the distressful, pitying faces of his wife and daughter, and tried to avoid them. But when he beheld Lord Polonius on the bench beside the judge, his rage was fearful; they had to hold him down on the bed; until, behind the justice-seat, appeared the face against which he had no power to hold up his head—and then he always collapsed, moaning and burying himself in the pillows. How vividly he remembered her warning on Christmas eve: 'According as you are kind and just to it, I will be merciful to you!' He had murdered it, he and those two vile confederates on each side of him; and seeing the dead mother behind the judge, with her white face and dark eyes fixed upon him, he knew that he had no mercy to hope for.

When the dreadful trial was over, and sentence passed, the worst punishment came, because, instead of the merciful seclusion of the prison, he was condemned to undergo his degradation before all the world. His wife and daughter beheld him, linked to his detested fellow-malefactors the Griffon and the doctor; all the clerks from his office came daily during luncheon hour to stare at him; business friends stood afar off, contemplating his condition with pity; ragged women jeered and hooted him; and Lord Polonius drove round daily in a slashing tandem in order to turn his head away with lofty abhorrence.

Matthew Bulbous possessed an iron constitution or he could not have survived all this—half of it would have killed an ordinary man. It was in the early twilight, one wintry afternoon, that he came back to the world once more. The amazed effort to realise where he was, or what had happened to him, was of course a failure. It was some dim but wondering reassurance to him presently to see his wife by the bedside, signing to him to be still, and gazing in his face with the unselfish devotion of a loving heart. Then a doctor came, examined his pulse and temperature, and silently disappeared again; and as, opening his eyes after a few minutes, he found himself alone and the room was darkening, there was nothing for it but to go to sleep, with some vague hope that when he awoke again he might be able to understand something.

When he opened his eyes next the room was very silent, and a shaded light stood on a table in a distant corner. Not being able to call, he tried to think. The effort proved in vain, for he could get no farther than an overshadowing fear that something very dreadful—the very worst, perhaps—had happened, and that he was only going to realise it now. It was painfully perplexing. Could a room like this belong to a prison hospital? Hardly—and he recollected having seen his wife. Convicts are not usually allowed to be nursed by their wives. Perhaps he had got off, by some trick of Clove his solicitor, and they had taken him away from the scene of his disgrace. Perhaps—worst of all, and the fear of it made him wish he had died rather—his trial had yet to come off.

Presently his wife came in and kissed him.

She had not for many years been wont to venture on that act of affection. Then some one came to the other side of the bed and also kissed him—this was his daughter Agnes. In the sudden fullness of heart brought on by this demonstration of pure and ill-merited affection, tears welled from the broken man's eyes, and he struggled to say: 'Mary—Agnes—I don't care now what I have lost—or what has happened—if you stay with me!'

'Dear, dear, we will always stay with you. You have lost nothing; you have been wandering in your illness.'

'Am I—at home?'

'No, dear; you soon shall be, when you get strong. Now sleep again; we will stay with you.'

'Yes, yes, stay; but I cannot sleep now. Tell me everything.'

'No, Matthew. To-morrow you will be stronger. You must not talk or think to-night.'

'Very well!' he said with a sigh; 'but I can't help trying to think.'

He dreaded to put that question which was uppermost in his anxious thoughts—whether he was still awaiting his trial. Trying to think, however, was of no avail, and at length he slept. Exhausted nature had much lost ground to make up before the balance was even again, and he did not wake until ten next morning.

A bright gleam of sunshine rested on the side of the window, and was the first thing he saw. In a while the doctor came, looking cheerful, and pronounced him to have safely landed on that happy shore where the patient has only to get well as fast as he can. Matthew Bulbous took all the nourishment they gave him, and enjoyed it; and then he learned, to his great wonder, where he was, and the nature of the accident that had befallen him. Simultaneously with the warning shout from the door of the police station—which was the last thing he remembered—a runaway horse and trap dashed round the corner and struck him senseless. Searching his pockets, the police found his card, and recollecting that some person of the same name lived a short way up the Croydon Road, they made inquiries. This was how it came to pass that Matthew Bulbous was nursed through his illness in his son's house; though it puzzled him greatly to imagine why James Bulbous should be keeping the house on, his wife and child being dead, and he himself having gone abroad after the wife's death.

When the doctor went away, Matthew began to question his wife. All about the accident she knew and told him; but when he tried to approach the dread subject of the death of the baby, cautiously feeling his way, as fearing what might have to be told him, Mrs Bulbous grew puzzled and distressed, for she apprehended that he was again relapsing into that delirium which had been so terrible to witness.

'Dear Matthew,' she suddenly said, 'would you like to speak to Jem?'

'Ay,' he answered, drawing a deep breath. 'Is he here? Very well; send him to me.'

The interview would have to come sooner or later, and he might as well get it over. Matthew Bulbous was not now his old self—of rock-like strength and inflexibility of character, but a

broken-down man—broken down first by misfortune and next by sickness. His son might be as stern as he liked with him; he was at his mercy now.

James Bulbous, however, did not look stern when he came to the bedside and took his father's hand. 'I am glad to see you better, father.'

'Well, Jem?'

The son regarded him a moment attentively, still holding the weak hand.

'Jem!' said Matthew Bulbous, gathering all his strength, 'if you will listen to me—patiently and forgivingly—while I confess how I have wronged and injured you'—

'Father, you need not go into all that,' said his son quietly.

'I must, Jem—I must! I have been a fool. I have ruined myself, and disgraced you all by my folly. Oh, Jem, Jem!' he exclaimed with all his soul, 'I wish it were all undone, and that I had the chance again of taking another course. I won't say I could approve your marriage to that—to your wife; but it doesn't become any one to be hard on what he thinks another's folly; and I might, when she was dead, have had more Christian feelings. It was all done for sake of—Jem!' he exclaimed, gaining sudden strength from the thought of Lord Polonius, 'upon my soul! I would rather see you married this day to an even worse case than to that old villain's daughter.'

This burst of feeling did him good. The son waited for him to cool before he spoke again.

'Did you ever see my wife, father?'

'See her? Why, of course—— Well, no; I can't say I did, Jem; but let her be. Joe told me all about her. Never mind, now. Tell me what has happened—about the—the baby,' he said, shutting his eyes. 'You will never forgive me that, Jem. Oh! I have been so unnatural! If I could only get your full forgiveness, Jem—and have satisfaction out of that wily old thief—I think I could die in peace.'

'I have something to tell you about him presently, father. But about my wife and baby'—

'Jem, Jem, Jem—spare me! If you knew how I have suffered—how your wife has haunted me'—

'But you have never seen her, father; how could she haunt you?'

'It wasn't the real one; but all the same, Jem, she has haunted me—about that baby.'

The perspiration was on his face; there was real suffering there.

'Poor father!' said James Bulbous, 'you have been under a terrible delusion. Before I tell you what has happened, will you promise to nurse no ill-feeling against others on account of it?—to let bygones be bygones?'

Matthew reflected. This was a serious proposition. But he was in a weak state of mind and body propitious to virtuous impulses, and after a while he answered: 'Very well, Jem; I promise—always excepting Lord Polonius!'

'We will leave out his lordship, then,' said the young man, smiling. 'And now, father, I will tell you how it was.'

James Bulbous related the story of his wife and child. Matthew was simply stupefied. The whole thing had been a malicious scheme of

Joseph Bulbous, intended to punish his masterful brother, and humble his pride by administering to him the biggest fright it was possible to give him. Joseph knew his man to the bone, as no other living person knew him, and the autocratic and self-sufficing brother had played into his hands with stupendous blindness. It was difficult to realise it.

'Joseph deceived you, father. He deceived me also. Why, father,' said the young man gravely, 'if you had only made inquiry of me even once—if you had only allowed me to speak that day you saw me at my chambers—if you had not implicitly put yourself in Joseph's hands as you did—all this could not have happened.'

'Then, your wife—your child'—Matthew commenced, fearfully.

They were both alive and well. Joseph, after leaving England—provided with the money intended for James Bulbous's continental trip—addressed a letter to his nephew recounting the whole plot. At the same time he despatched the telegram to his brother as a parting shot. The unfortunate child belonged to some one else—for it was a plot between Joseph and the woman Griffon, which paid the latter sufficiently well. The infant would have died in any case, in the course of nature—or business.

'So Joe is gone, then?' said Matthew regretfully. 'I gave him four hundred pounds for you.'

'He is half-way to New Zealand now.—I know, father,' the young man added, penitently, 'I ought not to have been so stiff-necked. I ought to have written to you and explained. But my pride prompted me to work and be independent. I am sorrier now than I can tell you.'

There was no deception here; his son's face was too honest. The Griffon and all the rest of that horror passed away like a nightmare—hideous, and as yet hardly comprehensible—and the relief was indeed deep beyond fathoming. What a terribly realistic actor Joseph had been through all the horrible business! And what a terribly realistic fool Matthew had been himself! But Joseph knew him to the bone, and the conviction of this fact covered Matthew with humiliation, which it is to be hoped did him good.

The fear of ruin and disgrace was gone now; and what remained? The wife and baby! These dread images were still in his mind, and he had been doing his best for the last few minutes to think of them with grateful resignation. But for all he could do, while thanking Heaven with one half of his heart that they were alive, the other half sank with the thought of them living and his wife and daughter in the same house with them. It was more than melancholy. The woman might reform; he was doubtful, very doubtful as to this—but the taint would cling to her for life—and he recoiled from the thought of her coming in contact with his own wife and daughter, whose value to him now was beyond all riches. And then the baby!—such things, as though in mockery of human vanity and pride, were terribly tenacious of life, and, as Mrs Griffon had pointed out, endowed with marvellous powers of endurance and survival.

The son did not understand the grief which he saw deepening in his father's face. Presently

he fancied he discovered its cause, and laughed quietly.

'Don't laugh at me, Jem; I'll bear it as best I can; but for the Lord's sake don't laugh at me!'

There was a soft rustle at the door, and James Bulbous made a sign to some person there.

'Father, my wife and baby,' he said gently.

Matthew shivered, and turned his pale face round to see. 'What is this?' he cried, starting up.

'My wife and child, father. Gertrude has been nursing you, as well as mother and Agnes.'

As he spoke, he quietly slipped from the room and left them together.

That pretty blushing face—how well Matthew Bulbous knew it!—the face that had been with him on Christmas eve, and had been haunting him since! Richly indeed did the pleasant look of Jem's wife this morning—and of her bright-eyed baby—repay him for what he had suffered. He drew them both to his breast and held them there, tenderly, thanking God for a mercy he had done so little to deserve.

That was a profoundly happy hour that followed, with Jem's wife sitting on the bedside and Jem's baby climbing over him. No person interrupted them; they were left quite alone, and it is hardly too much to say that under this new influence Matthew Bulbous unconsciously floated into a life he had never known before.

He was soon back at Blackheath with his family. The last stimulus to his recovery came from the information that Lord Polonius had gone into the City with his money and had there come to ignominious grief, finishing his financial career in the Bankruptcy Court. Matthew Bulbous was profoundly pleased; but still, he could not help a feeling of pity for Lady Jessalinda. Her father had been a blight upon her. Should it ever come in Matthew's way to do the poor lady a friendly turn in the way of business, he will probably be tempted to do it, provided it is absolutely certain that Lord Polonius reaps no benefit thereby.

Matthew read with deep and peculiar interest the report of the trial of Mrs Griffon and her accomplice the doctor, and the painful revelations which were made. It still made him turn cold to imagine what might have been.

He has abandoned the idea of entering Parliament, and is taking steps to sell Kirby St George. To the general world he is still the same man he always has been; but his eyes have been opened to one or two important facts. He knows the value of his domestic ties now, and the pleasure of coming home in the evening. After dinner, instead of shutting himself up in his study, as he used to do, he now sits by the drawing-room fire with pretty Mrs Jem (and the baby) always near to him. Agnes is to be married to the curate very soon. Jem, who has been called to the bar, works as hard as though his living depended on it; and his father has privately assured the young man's mother that one day Jem will be Lord Chancellor of England.

'Gertrude,' said Matthew one night to his pretty daughter-in-law as the fact struck him for the first time, 'for whom are you in mourning?'

She looked up with innocent surprise—not having the least knowledge of the fraud that had

been played on Mr Bulbous—and replied: 'For a little sister of mine, who died at Christmas.'

'Ah—of course, my dear,' he said with a slight start. 'Now I remember. That illness has played the mischief with my memory.'

THE MONTH:

SCIENCE AND ARTS.

IN a very interesting lecture on Art Metal-work, delivered recently at the South Kensington Museum by Professor Roberts-Austen, F.R.S., attention was called to the addition of lead to the other constituents of bronze (copper and tin) for the purpose of conferring upon the metal that beautiful velvety appearance known as 'patina,' which was induced by the after-effect of atmospheric exposure. The lecturer pointed out that it was quite hopeless to look for this effect upon any bronze-work exposed to such an atmosphere as that of London, and as an example referred to the recently-erected bronze equestrian statue of Lord Napier. Here there was no trace of that brown oxide, or rich green and blue carbonate, which was so valued by artists; but instead, there was gathering over the figure a black pall of soot and sulphide of copper, such as already enshrouded most of the London statues. The lecturer stated that modern workers made little use of the fine alloys which the metallurgist had placed at their command; but one British sculptor, Mr Alfred Gilbert, who was doing splendid work, made use of these alloys, and in his direction must we look for advance.

The adhesion of a limpet to its native rock has always been ascribed to atmospheric pressure, and, as every schoolboy knows, the action can be very well imitated with a disc of wet leather and a yard of string. But the limpet has recently been made the subject of certain tests, the results of which would seem to imply that it exerts a power far greater than pressure of the atmosphere would confer upon it. The experiments were made by Mr P. A. Aubin of Jersey, and are detailed in a letter by that gentleman to *Nature*. A delicate spring balance was fastened to the limpet shell, and a pull exerted upon it until the little creature was detached.

Some uneasiness may probably arise from the statement made by Professor Boys with regard to the explosive nature of certain buttons on a lady's dress, which appear to have become rapidly ignited when she stood near the fire. Many buttons and other fancy articles, even billiard balls and piano keys, are now made of celluloid, or artificial ivory, and although this substance is inflammable, it will certainly not ignite unless a flame be actually brought into contact with it. The explosive buttons were evidently composed of some substance of a different composition altogether, and may possibly have been the result of some crude experiment. True celluloid, under various names, has now been manufactured for about forty years, and if it had been dangerous to use or store, the world would have long ago been made acquainted with the fact.

A curious story was related at a recent meeting of the San Francisco Microscopical Society concerning an animal concretion which had been presented to that body. This specimen, which

had been removed from the kidney of a cow, was of the size of a large walnut, and had a peculiar lustrous golden appearance, due, like that of mother-of-pearl, to laminated structure. But the notion had got abroad that this foreign body was largely composed of gold-dust, which the animal had taken in with its food. Interest now therefore centred upon a particular hill, where the animal had been pastured, and which came to be regarded as probably teeming with gold; nor did the excitement subside until an acre of the ground had been sold for about fifty times its original price. These 'biliary calculi,' as they are called, are not unfrequently found in the liver and other organs of animals, and in ancient times were valued as a drug, and were administered powdered in wine, as a sure preventive against 'calculi' in man.

A terrible new form of advertising is foreshadowed in a patent which has recently been applied for. The idea is to throw words and other devices upon the clouds by means of a kind of magic-lantern search-light apparatus. Happily, there are very few occasions when the meteorological conditions would render such an exhibition possible, for clouds must be of a certain density and have a very definite surface in order to make the experiment successful. Rainy nights as well as cloudless nights would give no opportunity of exhibiting, and the enterprise would also be stopped by fogs. We may therefore feel comforted by the assurance that not just yet will any one be able to turn our skies into hoardings for his advertisements.

Chloride of ethyl has lately been well spoken of by certain continental doctors as a good substitute for ether as a local anæsthetic. When ether is used it is sprayed on to the part to be rendered insensitive to pain, and the evaporation induces such a reduction of temperature that the part is actually frozen. With the chloride of ethyl, which is a colourless liquid with a pleasant odour, the same result is brought about without any special apparatus. It is sealed in small glass tubes having at one end a very fine point; and when this point is broken off and the orifice directed to the part to be anæsthetised, a fine stream of liquid is driven out by the heat of the hand which holds the tube. The method is said to be extremely useful in tooth extraction and similar minor operations.

The good people who live in the vicinity of Cape North, the headland which is a noticeable feature of the eastern entry to the Gulf of St Lawrence, have recently met with a windfall in the shape of thousands of seals. These creatures have not been known to visit this locality for the past eighty years, and it is supposed that their coming now is involuntary. It is believed that, owing to the mild weather, huge ice-blocks have broken away on the coasts of Greenland, and that the seals have drifted with them to this place. All other occupations have been given up for the profitable business of seal-hunting, and great catches have been made.

The works and buildings for the forthcoming Exhibition at Kimberley are now in active progress, and it is believed that this will be the most important enterprise of the kind which has ever been projected in Cape Colony. The Government are supporting the scheme, and have arranged with

the railway departments to carry all goods intended for the Exhibition to and from Kimberley free of charge. They have also decided that the Exhibition shall take the position of a bonded warehouse, so that no duty will be payable on unsold goods. Full particulars relating to this enterprise will be found in an interesting paper which was brought before the Society of Arts, London, by Mr Lewis Atkinson, and subsequently published in their *Journal*.

In the paper just referred to, Mr Atkinson, in noting a statement attributed to Lord Randolph Churchill to the effect that he could find no other motive for the diamond industry than woman's vanity and its gratification, affirms that diamonds have been of far wider benefit to the Colony than most persons are aware. This industry, he asserts, has helped civilisation, brought capital to the country, developed the railway system, and, better than all, has attracted new blood and fresh life from every part of the world. There are four principal diamond mines; and since the year 1883 accurate official returns of the exact weight and value of the diamonds produced in the several mines have been compiled. It is known that, notwithstanding the severe punishment inflicted in case of detection, many diamonds are hidden by the workers, and never reach their lawful owners. The total value of the diamonds produced in the Griqualand West Mines since their discovery to the present time reaches the enormous sum of fifty-seven million sterling! The value of the diamonds exported last year was considerably more than four million sterling.

The New York legislature, following the laudable example of certain European States, have under consideration an Act to prohibit public exhibition of hypnotic experiments, and to prohibit hypnotic treatment by any one except duly licensed physicians.

In view of the more general adoption of the one-pound note in this country, Sir Henry Bessemer has made a suggestion. He proposes that instead of a note engraved on paper of the usual kind, which has several disadvantages in that it is readily destroyed, can be easily counterfeited, is a medium for the transmission of dirt—possibly disease, think some—&c., the new note should be made of aluminium. This metal is not much heavier bulk for bulk than paper, will not tarnish, and by suitable alloys can be made hard enough to resist ordinary wear and tear. The proposed note would indeed take the form of a coin or token, of little intrinsic worth, but fully answering the required purpose. We fancy that the chief difficulty in adopting the suggestion will lie in providing safeguards against forgery. The exact reproduction of the most elaborately engraved design on metal is a matter about which there is no difficulty whatever, and a process which is carried out daily by electrotypers in every town in the kingdom. Nor can the Government obtain the monopoly of any particular kind of metal, as they can of paper of special make, as in the case of the present bank-notes.

A paper was recently contributed to the Bombay Natural History Society by Mr Inverarity, entitled 'The Mammalia of Somaliland.' The author of this paper, who by profession is a barrister, could speak of personal acquaintance with

his subject, for last year he went on a shooting expedition to the district named. Like every other animal, he tells us, the lion will endeavour to avoid man until wounded. It is only in exceptional cases that they will charge when tracked, and then they come on at great speed close to the ground, and certainly not bounding in the air, as they are commonly represented in pictures. On one occasion Mr Inverarity was seized by a lioness, who luckily expended her fury on his gun instead of on himself. As an instance of her terrible strength, he says that although the jaw of the beast was broken, she scored deep grooves in the barrels of his rifle with her teeth.

A correspondence has lately been published in the *Kew Bulletin* relative to instruction in horticulture. A well-known authority there expresses his opinion that the cultivation of plants is an art that can only be acquired by practice, and that it cannot be taught in the lecture-room. There is no royal road to it: the learner must begin at the bottom and go through every operation from the most elementary to the most difficult and refined. The mere reading of books and attendance at lectures is of little use.

According to a medical authority, the reports concerning ether-drinking in Ireland are much exaggerated, and instead of the whole north of the country being affected, the vice is confined to half-a-dozen small towns. It is said that the practice of ether-drinking originated in the time of cholera, more than forty years ago, when a quack doctor sold drams of ether as a preventive against the disease. Finding the intoxicant a pleasant one, the people continued its use after all need or excuse for it had disappeared. The same degraded habit of ether-drinking has, says a German medical paper, spread to such an extent in Russia, that the Government have forbidden its sale except under the same restrictions which affect the sale of powerful poisons.

An alarming statement was made recently by one of the witnesses called before the Labour Commission with reference to the packing of chlorinated lime, or bleaching powder. The gas given off by this compound when freshly prepared is so deleterious in its action on the face and lungs, that the workmen wear a kind of muzzle, which envelops the mouth and nostrils, but which leaves the eyes just visible. The wearers, as a further precaution against the action of chlorine, soak their nostrils and eyelashes with oil, besides taking other precautions, which indicate that the occupation as at present carried on must be one of the most harmful and disgusting which it is possible to conceive. Employers in such trades should be compelled to furnish their workmen with artificial breathing apparatus, such as has been proved to be efficient in the exploration of mines full of choke-damp, and in other situations where an irrespirable atmosphere is present.

It is reported that an archæological discovery of an extraordinary kind has been made at Helsingfors, in Finland. This consists of a huge chest with iron fastenings, which on being opened was found to contain a roll of parchment, and several pieces of ancient ironwork curiously fashioned. The roll of parchment is said to date from the twelfth century, and to contain a com-

plete and detailed treatise on steam as a means of power, and its applications; while the ironwork is a rudimentary steam-engine with cylinder, piston-rod, &c. The work is presumed to be that of a Gallican monk. This discovery, if true, will set aside the claims of our countrymen Savory, Newcomen, and Watt, to be the originators of the machine which has wrought such changes in the world. On the other hand, it may turn out to be a cleverly-concocted hoax.

Messrs Ransome of Chelsea, the well-known makers of wood-working machines, have just constructed the largest band-saw machine which has ever been made. The saw itself is an endless ribbon fifty-four feet in length, and eight inches wide, which travels at the rate of seven thousand feet per second over wheels or pulleys, which are no less than eight feet in diameter. The entire height of the machine is twenty feet, and it weighs as many tons. The saw has been made for a company in New Zealand, where the timber—mainly blue gum-trees—grows to an enormous size, and can only be dealt with by exceptional appliances.

Many references have recently been made to the statement that sea-water contains a certain proportion of gold, and the assertion has been made that the quantity of the metal present amounts to as much as one grain per ton of water. Now it stands to reason that as sea-water covers about four-fifths of the earth's surface, and can be had in any quantity for nothing, any one who could invent a process for catching up and turning this gold to the metallic state would quickly reap a large fortune. Such machines, for abstracting both silver and gold from sea-water have, we understand, been patented. But the proportion of gold in the liquid is certainly very much less than the amount stated, perhaps too small to be estimated by the means at present available. There is a wide difference between a qualitative and a quantitative analysis.

A writer in the *Times* asserts that after a sharp frost in the middle of March last a dabchick, or little grebe, was found caught by her foot in the ice at St James's Park, London, and that six or seven couples of these birds breed regularly in this Park year after year, coming generally at the end of March, and disappearing in October. He also calls attention to the fact that wood-pigeons, which until recent years were somewhat rare, can now be found in dozens in all the London Parks.

Many of our readers will be interested in hearing that the various curling clubs in New York and its vicinity have for want of sufficient accommodation banded themselves together, and have built a large hall where indoor curling can be carried on all through the winter. The floor of this curling-hall measures one hundred and fifty by one hundred feet, and is made of narrow strips of yellow pine one inch in thickness; the whole being raised four feet from the ground. There are trapdoors below each window round the sides of the hall, through which the outer cold is admitted when it is required to freeze the water which is sprayed over the floor. This spraying is constantly renewed, so that when the end of the winter approaches, the layer of ice is from two to three inches thick. The circles at each end of the rink are painted black on the

bare floor, and can easily be seen through the transparent layer of ice. An illustrated description of this novel curling hall is published in the *Scientific American* for February 27th.

The sunflower in Russia has something more than an æsthetic value; indeed, its cultivation represents a very important industry. According to a Report by the United States Consul-general, its cultivation was begun in the year 1842, for the purpose of obtaining oil from the seed. There are two kinds of sunflowers cultivated—one having small seeds, used for the production of oil; and the other with larger seeds, which are consumed by the people in great quantities as a delicacy. After the oil is extracted, the residue, in the form of cakes, finds a ready sale as food for cattle, not so much in Russia as in Germany and Britain. The refuse of the flowers with their shells is used as fuel, and the seed-cups are used as food for sheep. For the purpose of oil-making, the seeds, after being thoroughly cleansed, are passed beneath mill-stones to free them from their shells. Pressure is next applied, and the resulting compact mass is passed into vessels heated by steam. The paste is next enclosed in bags made of camel-hair, and again pressed to extract the oil, which runs into tanks. This oil, if made with proper care, is said to equal the best olive oil in colour, flavour, and taste.

It is a curious fact, says a writer in the *Mediterranean Naturalist*, that different birds have a preference for certain trees; and still more curious is it that the circumstance seems to have attracted little notice on the part of naturalists. The oak-tree harbours jays and rooks; finches prefer lime-trees; while black-caps are found chiefly among the laurels. The thrush has a preference for the birch and the ash; the beech is the carpenter's shop of the woodpecker; while the sweet nightingale sings in the nut-groves.

OF OLD LICENSES.

IN 1603, King James I. was thus apostrophised in the Poor Man's Petition: 'Good king, cut off their paltry licenses and all monopolies! Fie upon close biting knaveries!' It was a wasted prayer. Oppressive as the grievance had grown to be, the practice of granting royal licenses conferring exclusive manufacturing and trading privileges to individuals, either out of court-favouritism, as a reward for services rendered to the Crown, or in return for a monetary consideration, was too convenient and profitable to the royal grantors to be readily abandoned out of regard for the general good. We do not purpose, however, to dilate upon the mischief caused by the ordinary run of such abuses of the royal prerogative, but simply to note some of the more curious and interesting examples of the licensing system in vogue in old days.

Says Glaphorne in his play *Wit in a Constable*: 'The Dutch younker took her up into a what do you call it—a sedan.' The word, like the thing, was then new to town's-folk, the sedan having just been introduced into London streets by Sir Sanders Duncombe, under a license he obtained in 1634, giving him the sole privilege of using, putting forth, and letting on hire, in

London and Westminster and their suburbs, certain covered carriages, the like whereof being used in foreign countries, prevented the unnecessary use of coaches, with the multitude of which the streets were so pestered and encumbered, that many of His Majesty's subjects were exposed to much peril and danger; and the use of carts and carriages for the provisions of the two cities much hindered. Duncombe provided some fifty specimens of the sedan for the use of the public, who took quickly and kindly to the novel conveyances; although, when the Duke of Buckingham, a few years before, imported one for his own personal convenience, he was subjected to hearty vituperation for making beasts of burden of his fellow-creatures.

In 1671, Prince Rupert obtained the exclusive right of using an invention for converting into steel all sorts of iron wire, and all manner of edged tools, files, and other instruments forged and formed of soft iron; for preparing and softening cast and melted iron so that it might be filed and wrought like wrought iron; and likewise for tincturing copper upon iron in such a manner as seemed meet in his discretion. Supposing the processes Prince Rupert desired to employ were of his own devising, no injustice was entailed in so privileging him for fourteen years.

There was similar justification, too, for Queen Anne securing Robert Pease, of Kingston-on-Hull, against others reaping the fruits of his ingenuity in concocting a soft soap for bleaching linen, which had the additional merit of being eatable; as it may have been good policy to encourage native industry by giving William Corr the sole right of making 'lamb-black, not made before in England, much cheaper and better than any brought from abroad;' and allowing Jane Tasker the monopoly of working her own invention for making flask-cases, and covering flask-glasses with flags, rushes, and straw, in imitation of those brought from Florence.

The pluckiest of modern promoters would flinch at attempting to float a company for whaling on the English coast; but very early in the last century, Arthur Kemp, Robert Corker, and Valentine Ennys, believed they could make a good haul that way. Accordingly, in 1707 they prayed for the royal leave and license to fish and take whales, crampoes, bottle-nosed whales, and other large fish belonging to Her Majesty by virtue of her royal prerogative, on the north and south seas adjoining the counties of Devonshire and Cornwall; Her Majesty to retain the power to cancel the license at the end of two years, if they neglected to carry out their undertaking, or failed to succeed therein. The sanguine three got their license; whether they got their whales and other large fish is not recorded.

In 1706, Robert Aldersey was licensed to construct a floating dam to carry barges, lighters, and other vessels over the greatest flats and shallows of navigable rivers, his dam having received the approbation of several of the most eminent mathematicians. At this period the provision of lighthouses and beacons appears to have been left to private speculators, for in 1711 we find James Everard and his wife Rebecca the recipients of a license which was to endure fifty years—empowering them to newly erect, alter,

maintain, and improve certain lighthouses and beacons upon Hunston Cliff, Norfolk, with lights to be kept continually burning therein in the night season, for the security of seafaring men passing that way. By way of recompense, the Everards were authorised to demand and take eightpence for every twenty chaldrons of coals, and every twenty tons of other goods in and upon all English ships; and one penny per ton of all foreign vessels passing by their lighthouses, and trading to and fro between King's Lynn and Boston.

In 1709 the readers of the *Tatler* were informed that a new sort of light, called a Globe Light, which enlightened the street and all parts near it with a bright steady light, noway offensive to the eyes, was to be seen at St James's Coffee-house, near St James's Palace, where the person who contrived and set it up might be heard of, he having obtained Her Majesty's patent for the same. Probably this was the new kind of light, quite different from any yet used, composed of one entire glass of a globular shape, with a lamp giving a clearer and more certain light, without any dark shadows or anything else confounding to the sight, for which, a year before, Michael Cole of Dublin obtained a license, with the proviso, that the invention must not be used within the city of London until the expiration of the year 1715, to the prejudice of the proprietors of the public lights then in use, called convex lights. Whether this proviso handicapped the Globe Light too heavily, or whether the patentee expired before the proviso, we do not know, but we can find no further trace of it.

Perhaps the most curious license issued in Queen Anne's reign was the following: 'Anne R.—Whereas we are fully sensible of the fidelity of John Ker, of Kersland, by and of the services he hath performed to us and our Government. We therefore grant him our Royal Leave and License to keep company and associate himself with such as are disaffected towards us and our Government, in such way or manner as he shall judge most for our service.—Given under our Royal Hand at our Castle of Windsor, the 7th of April 1707, and of our reign the sixth year.'

Englishmen were not always free to go beyond the seas when inclination suggested a change of scene or climate. It was only by the favour of the Lord Chamberlain that Bulstrode Whitelocke, in 1634, obtained a license from the Privy Council to go to France, and this when the two countries were at peace. Even in time of war it was not, of course, possible to prevent people travelling in friendly lands from finding their way into France; but those who so ventured found coming home not so easy. William Stonor, Esq., having entered the dominions of the French king without leave from his own sovereign, had to sue for a license permitting him to return and abide in his 'ain countrie.' Wishing to reside in France, Lady Elizabeth Hatcher received the necessary permission conditionally that she did not pretend to the liberty of coming into any part of Her Majesty's dominions again without first obtaining license to do so under the Privy Seal—on pain of incurring the several penalties the law could inflict. In 1707, a merchant named Collins contracted to supply eight thousand feet

of black marble 'for the rebuilding of St Paul's Cathedral.' He shipped six thousand feet at Dublin in the *Unity* of London, which ship was captured by a French privateer and taken to Havre. As soon as the untoward news reached Collins, he petitioned for permission to go to Havre and repurchase his property. His petition was referred to the Attorney-general, who returned it with the declaration that the voluntary embarking in any vessel to visit a country at war with England was high-treason, unless the parties obtained a royal license. Collins obtained one, authorising him to go to France and fetch a certain quantity of black Irish marble, to be applied towards the rebuilding of St Paul's Cathedral, he giving security that all persons employed by him in the service should return to Great Britain within six months, bringing with them only the marble, and no other goods or merchandise whatsoever.

EVENING.

DIM falls the light o'er all the dreaming woods;
Athwart the distant western sky are gleams
Of gold and amber; pearly rose-edged clouds,
Looking so passing fair, one almost dreams.

The opening gate of Paradise hath lent
Some tinge of glory to the dying day;
And earth-bound souls, with longing, ling'ring gaze,
Would fain rise up and move along that way.

A stillness sweet and solemn all around;
The song of birds is hushed; there falls no quiver
Of rustling leaf, or shaken trembling reed,
Upon the fair faint brightness of the river.

The crescent moon gleams coldly, dimly, forth;
And in the deep'ning blue of heaven, afar,
A tender watcher o'er the troubled world,
Shineth one solitary glitt'ring star.

The shadows deepen on the distant hills;
The highest peaks but touched with ling'ring light;
And down their purpling sides, soft misty clouds
Wrap all the valleys in a dusky night.

And far away the murmur of the sea,
And moonlit waves breaking in foamy line.
So Night—God's Angel, Night—with silvery wings,
Fills all the earth with loveliness divine.

GRAHAM.

** TO CONTRIBUTORS.

- 1st. All communications should be addressed to the 'Editor, 339 High Street, Edinburgh.'
 - 2d. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
 - 3d. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them in FULL.
 - 4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.
- If the above rules are complied with, the Editor will do his best to ensure the safe return of ineligible papers.

CHAMPAGNE GOSSIP.

It has been said that if it were not for the wines, the country of Champagne would be the poorest province in France. There is doubtless some exaggeration here; for even the chalk hills of the Marne Valley are not so intractable as the basaltic and scoriaceous mountains of Auvergne and the wildernesses of the Lozère. But for the sake of emphasis, the utterance may be received. It is to the inimitable wines that the gay-looking little towns of Epernay, Ay, and Château-Thierry owe their prosperity. True, there is plenty of fruit in the valley through which the lazy Marne wends its way with broad barges as comfortable as yachts on its spacious bosom. But man does not live by fruit alone, or mainly. The grain is not good in this part of the world. The light chalky soil does not agree with it.

Nor at a casual glance does this soil seem to suit the grapes themselves in an uncommon degree. The vines are of no particular height or density; and the bunches of fruit are not very large. But the crushing tells another tale. They are very prolific of juice, and even a third or fourth pressure will give a wine called Champagne, which a stranger with an uneducated palate and a patient stomach may pronounce sufficiently toothsome. This is the Champagne so boldly shown in the inferior shops of Rheims, and offered to the eager tourist at a shilling and fivepence the full-sized bottle. The ladies do not find much fault with it, because of its sweetness. But to a man of mature age and judgment it is nothing less than horrible. It is as apt to torture the stomach as to please the tongue—'for though good Champagne is one of the wholesomest of wines, the bad is more than commonly pernicious.'

The visitor to Champagne must not expect to buy good Pommery or Mumm much cheaper than he could buy it in England. Somehow, notwithstanding import duties, there is no difference between the wine lists of a good London hotel and the best hotels in Rheims. Nor is the *vin*

ordinaire of the country the familiar sparkling beverage which exhilarates by its mere appearance. It is an indifferent still red wine, not to be named with the *vin ordinaire* of the Burgundian towns. I felt the disappointment keenly when I sat to my first meal in the centre of the Champagne country. This was at Epernay, where the hostess of the hotel herself played the part of waitress. For fellow-guests at table I had divers comfortable-looking merchants, one of whom, in contrasting the wages of the labourer in different parts of France, told of a lace factory in the neighbourhood where the girls earn five halfpence a day and no more. A franc and a half a week does not seem much even in France, where the necessities of life cost considerably less than they cost with us.

Work in the Champagne vaults of Rheims and Epernay is much better remunerated than are these poor factory girls. It is not altogether the most pleasant occupation in the world. The smell of Champagne is very strong. I have heard of men who, after simple inhalation of it, for a time showed signs of slight intoxication. But such an experience is of course quite innocuous. We have it on good authority that no one ever suffers in the after-results caused by Champagne: conditionally, however, upon the Champagne being of undoubted quality. You may, in fact, drink a quantity of Pommery's 1884, and you will the next day feel better than if you had taken but a few spoonfuls of the highly effervescent stuff in the shop-windows at one franc seventy-five centimes the bottle, or threepence the long glassful. Even the idea that gout could be caused by Champagne has been seriously dissipated by medical men in conclave. Among the hundreds of men and women who find employment in the cellars of Moët and Chandon, Geisler, Mumm, Heidsieck, Pommery, Goulet, and the other famous firms of Rheims and Epernay, you will not see any signs of gout. To be sure the workpeople are not allowed to drink Champagne *ad libitum*. But they are human beings with ordinary liability to

yield to temptation; and with thousands of bottles bursting in the cellars month after month, it were manifestly as easy to pour a little of the wine down their throats as to turn it into the gutter which traverses the miles of galleries in which the bottles are racked.

These people have to work in a temperature uniformly wintry. In the dog-days it must be trying to some constitutions to descend after the dinner interval from an air hot enough to melt butter into an atmosphere only about fifteen degrees above the freezing-point. It is so damp too. The walls of the chalk are green and trickling; and in an hour or two the coat you are wearing will feel as if you had been in a shower. Remember, too, that it is exceedingly gloomy in these caverns, so damp and cold, and that you are about a hundred and forty feet below the street pavements. Then you will probably not think good pay at all too generous a concession to the men who spend nine or ten hours daily thus interred out of sight. It is not a healthy existence. Even with the added privilege of drinking as much red wine as inclination desires, the temptation to enter the service of Messrs Heidsieck of Rheims need not be irresistible. There is also a certain peril from the bursting bottles which ought not to be forgotten.

Upon the whole, it is better to be a vine-grower than a wine-maker, at least in the subordinate branches of the two industries. 'The culture of the vine,' we are told by French authorities, 'is not only the richest of industries; it is also the most salubrious. The people who devote themselves to it are the healthiest and most prolific. Among fifteen conscripts in a vine-growing district ten will be found fit for service: elsewhere, the proportion is ten in twenty-five.' An old proverb is still current in Languedoc which says, 'The vine begets many leaves and more pence, but more children than leaves and pence put together.' It is, in fact, enough merely to look at the blue-smocked workers among the dry soil of the vineyards on the slopes of the mountain of Rheims, to realise that they are fine fellows. They carry themselves admirably: and the same may be said of the women and girls who help them in their labours.

One half expects, upon arrival in Rheims, to see Champagne bottles littering the streets, and to hear the popping of corks every minute in the day. But this is, of course, a very fanciful estimate of the effect of the industry. Rheims is really a tranquil old place, with nothing in it so exciting as its fame. The cathedral is not at all suggestive of Champagne. It is a wonder of Gothic art, and transports one far, far away from thoughts about 'Dry Monopole' and the wine-lists in general. The jackdaws continue to wheel about the chipped and scarred statues which bedeck its noble façade; and the sober music of its bells sounds at dawn over the old

red roofs and the new red roofs of the city, much to the discomfort of those who have been bold enough to engage rooms in the hotels within but a stone's-throw of its portals. Rheims is the seat of the first ecclesiastic in France. The archiepiscopal palace adjoins the cathedral upon the south side, and an imposing porter guards the entrance to it. The contrast between a Christian dignitary and Champagne is extreme; and yet it is not so very unfit that the first churchman and the noblest wine of France should be found in the same town, when one remembers that it is just to the patience and cultivated palate of the old monks that we owe not only the beginning of Champagne but the origin of most other of the choice wines of the land. These old recluses devoted themselves to their wines as other men devoted themselves to their leather-selling and bread-baking. They learned the capabilities of their soil, and improved their grapes by careful grafting and the most zealous of tending. And afterwards experience and the leisure to continue to experiment taught them how the wine might best be made and stored so as to mellow it to perfection.

It must not be supposed, however, that the sparkle of Champagne is due to external aid. It is not an affair of drugs. This, and this more than aught else, is the specialty of the Champagne grapes. And the treatment of the grapes at the picking fosters the quality. The fruit is picked with the utmost care—bruised or over-ripe grapes being rejected, and they are pressed immediately while still cool. There are no secrets in the cellars of Rheims, like those of the Benedictines at the Chartreuse. You or I might set up a Champagne factory to-morrow with fair hope of being able to do well—the only requisite being capital of about a quarter of a million sterling and a vast deal of patience. But it would be hard now to find cellars unclaimed like those which Messrs Pommery, Goulet, and others have inherited from the Romans, and which are the very thing for so capricious a wine as Champagne. This should be kept 'where no motion can affect it, and as far as possible from the vibration or rather trembling of the earth from the traffic over granite pavements.' At a depth of more than a hundred feet such security from disturbance may well be thought complete. Manifestly, however, miles of excavations of this kind are not to be made without much expense. Besides, it is necessary to have staying-power at one's bankers, in other words a good balance to withstand the adverse strain of adverse years. The following is as applicable to merchants as to private consumers: 'Good wine is most frequently to be found among capitalists who can afford to buy up large quantities in favourable years, the cheapest mode of purchase, who can bottle as it may be deemed most fitting for the contents of their cellars, and who have a reputation to lose.' The last condition is as potent as

any. Of itself alone it is enough to terrify the aspirant towards the establishment of a new brand out of a city in which the existing merchants' grandsires or predecessors of the third and fourth generation began to build the fame they enjoy to-day. Much courage is required to enable a man and his heirs to hold on in confidence through ill report as well as good report for nine or ten decades. That is why, it seems, the old houses of Champagne are in no fear of the effects of competition.

Of the various show-cellars in Rheims, perhaps those of Messrs Pommery will most excite the admiration of the visitor. The establishment occupies a large enclosed area on the skirts of the city, and its bright red buildings have a suggestion of the opulence that has come from Champagne-making. The carts with their burdens of cases bearing directions to all parts of the civilised world meet you in the courtyard to hint at the immense growth of the appreciation of Champagne during this century.

About five hundred and fifty persons find employment on these premises. It is employment of a very varied kind. The courteous old cellarer-in-chief who receives the visitor in the great hall is to the young hands of the factory a personage of immense regard, and as much above them as the President of the Republic himself. Yet to the eye he is just such a one as the man who takes you in hand as a guide and gives you a candle to illumine the way as if you were descending into a coal-pit. He wears the traditional blue smock. But very little conversation with him enables you to judge that he is a man of culture. Indeed, the surroundings of his office are of themselves a mild education. On the walls are two or three notable pictures which have won esteem in the *salons* of Paris. Besides, is he not called upon day after day to entertain people of some distinction? His visitors' book proves this to you. Capitalists from America, statesmen from England, princes from Russia, and smart journalists from Paris, are among his weekly guests. And he is equal to the task of amusing them for half an hour at least; though, to be sure, he is likely to be much aided by the bottles of Pommery which are opened as a matter of course to add to the visitor's pleasure.

The bloused Englishman who offers himself as cicerone in the great hall may whisper to you as you leave the worthy cellarer that this gentleman's income is about two thousand pounds a year. It seems astonishing; but you have no time to wonder over so small an affair. You are at the head of a long flight of steps which lead you from the ground-level into the bowels of the earth, where there are miles of bottles of Champagne. The great model of a Chinese pagoda in the hall, which you pass on your way, has no occult connection with wine-making or even wine-drinking. It is merely a decoration of the establishment, like the *salon* pictures and—if the old gentleman will pardon the words—the excellent cellarer-in-chief himself.

Of the like nature are the surprising tableaux

in stone which meet the eye in three or four of the galleries. These are the work of a Rheims artist named Narlet, and all done within the last decade. They have a very realistic effect, indeed, in the half-darkness. You might fancy that the Bacchus upon the wall would, at a summons, descend and share a bottle of the clear primrose-hued liquor at his feet. The banquet scene, too, in which ladies and gentlemen of the last century are toasting each other in a condition of extreme animation, and of course drinking Champagne, is admirably designed and well executed. It is nothing in detraction of the artist to be told that he was paid by the hour for his work like a mere stamper of corks.

From one gallery we pass to another with bottles ever alongside. Here and there we come upon a broad beam of light which streams down a spacious vertical shaft in the rock. These shafts are not to be found in all the cellars of Rheims. They are a strong spectacular feature. Also they may be said to have a sanitary value for the workers themselves. Messrs Heidsieck's underground premises seem more insalubrious for the lack of such inrush of drier air. It is possible enough that the wine does not require them, since coolness and damp suit the maturing Champagne; but even in this nursery of great brands, one cannot altogether forget the welfare of the men who spend the best part of their lives among the bottles.

The operatives themselves are seen faintly in the corridors, some at work turning the bottles to tilt the sediment towards the cork; others carrying baskets of the matured wine to the packing-house up-stairs; and yet others engaged in the *dégagement* of the sediment, which may be said to have all come to the surface in the second year of the wine. This last is a nice performance. Not every man is a born 'disgorger,' as the operator is termed; some men are so clumsy, that in freeing the cork and the sediment they spill a measurable quantity of the transparent wine also. With one bottle in fifty that would not matter. But there are about fifteen million bottles in this great series of cellars, and each bottle has to undergo this process. The skilful disgorger is therefore a valuable servant. He cuts the string, expels the accumulation, and passes the bottle to the next man, to refill with sweet Champagne liqueur, all in a moment or two. Then the bottle is corked by machinery—for the last time—transferred to the wirers, who also have a machine which cuts wires of uniform length; and from them it is duly conveyed up-stairs to be beautified with gay tinfoil, labelled, and sent to its destination. It is fitting that the fair sex should have charge of the æsthetic stage in the life of a bottle of Champagne. The corks, the tinfoiling, and the labelling are their province.

A conscientious study of vaults as spacious as Messrs Pommery's exacts several hours; that is, if you are a wine-merchant and anxious to thoroughly understand the genesis of Champagne. But the ordinary visitor will obtain a sufficiently broad idea of the industry and its methods in an hour or two. That also will be time enough to make him long for the upper air. But before he leaves the establishment, the hospitable chief-cellarer will account him absurdly ascetic if he

will not consent to drink a glass or two of the wine with the bottles of which he has become so familiar. There need be no difficulty about obliging him in this particular.

THE IVORY GATE.*

By WALTER BESANT.

CHAPTER XVII.—THE VOICE OF DUTY.

ELSIE in her studio was at work. She was painting a fancy portrait. You have seen how, before her interview with Mr Dering, she transformed him from a hard and matter-of-fact lawyer into a genial, benevolent old gentleman. She was now elaborating this transformation. It is a delightful process, known to every portrait-painter, whereby a face faithfully represented becomes the face of another person, or the face as it might be, so that a hard and keen face, such as Mr Dering's, may become a face ennobled with spiritual elevation, benevolence, charity, and kindness of heart. Or, on the other hand, without the least change of feature, this hard keen face may become, by the curve of a line or the addition of a shadow, the face of a cruel and pitiless Inquisitor. Or, again, any face, however blurred and marred by the life of its owner, may by the cunning portrait-painter be restored to the face intended by its Maker, that is to say, a sweet and serious face. Great indeed is the power, marvellous is the mystery, of the limner's art.

'Now,' Elsie murmured, 'you look like some great philanthropist—a thoughtful philanthropist, not a foolish person: your high forehead and your sharp nostril proclaim that you are no impulsive gusher: your kindly eyes beam with goodness of heart: your lips are firm because you hate injustice. Oh my dear guardian, how much I have improved you! Something like this you looked when you told me of my fortune—and like this when you spoke of your dream, and your illusions—something like this—you looked.'

She went on working at her fantasy, crooning a simple ditty, composed of many melodies running into one, as girls use when they are quite happy. The afternoon was hot. Outside, Elsie's windows looked upon a nest of little London gardens, where nasturtiums twisted round strings upon the walls; hollyhocks and sunflowers, which love the London smoke, lifted their heads; and Virginia creepers climbed to the house-tops. The little London gardens do sometimes look gay and bright in the yellow glow of a July afternoon. The window was open, and the room was almost as hot as the street outside; we get so few hot days that one here and there cannot be too hot. On the table lay a photograph of her lover; over the mantel hung her own drawing in Pastel of that swain: on her finger was his ring: round her neck lay his chain: all day long she was reminded of him, if she should cease for a moment to think of him. But there was no need of such reminder. It was Friday afternoon, four days after the great Discovery. Elsie had been informed of the event, the news of which she received after the feminine manner, with an

ejaculation of surprise and an interjection of sympathy. But one cannot expect a girl on the eve of her marriage to be greatly distressed because her guardian, a rich man, is annoyed by the temporary loss of certain shares. And as to finding the criminal and getting back those shares—it was man's work. All the troublesome and disagreeable part of the world's work belongs to man.

It was nearly five o'clock. Elsie was beginning to think that she had done enough, and that, after tea, a walk in the Gardens might be pleasant. Suddenly, without any noise or warning of steps outside, her door was opened and her sister Hilda appeared. Now, so swift is the feminine perception, that Elsie instantly understood that something bad had happened—something bad—something bad to herself. For first, the door was opened gently, as in a house of mourning; and next, Hilda had on a dress—lavender with heliotrope, costly, becoming, sympathetic, and sorrowful—a half-mourning dress—and she stood for a moment at the door with folded hands, her classical head inclined a little downward to the left, and her eyes drooping—an artistic attitude of sadness. Hilda not only said the right thing and held the proper sentiments, but she liked to assume the right attitude and to personate the right emotion. Now, it is given to woman, and only to her when she is young, tall, and beautiful, to express by attitude all or any of the emotions which transport or torture her fellow-creatures. Hilda, you see, was an artist.

'Come in, dear,' said Elsie. 'I am sure that you have got something disagreeable to tell me.'

Hilda kissed her forehead. 'My poor child,' she murmured. 'If it could have been told you by anybody else!'

'Well—let us hear it. Is it anything very disagreeable?'

'It is terrible. I tremble—I dare not tell you. Yet I must. You ought to know.'

'If you would go on. It is much more terrible to be kept in suspense.'

'It is about George.'

'Oh?' said Elsie, flaming. 'I have had so much trouble about George already, that I did think—'

'My dear, all opposition of the former kind is removed, as you know. This is something very different. Worse,' she added in a hollow voice—'far worse.'

'For Heaven's sake, get along.'

'He has told you about the dreadful robbery. Of course you have talked about nothing else since it happened. I found my mother full of it.'

'Yes—George is in charge of the case. He says that everything must be recovered, and that Mr Dering will in the end suffer no more injury than the trouble of it.'

'That may be so. Elsie—I hardly dare to tell you—there is a clue. Checkley has got that clue, and has told Sir Samuel everything. He is following up the clue. I shudder to think of it. The man is as relentless as a bloodhound.'

'Does that clue concern me?' Her cheek became pale because she guessed—she knew not what.

'Sir Samuel, against his will, is convinced that

* Copyright 1892 in the United States of America by Harper & Brothers.

Checkley has found the clue. He has told me the whole. He has consented to my telling the dreadful story to my mother and to you—and now I am afraid. Yet I must.’

Elsie made a gesture of impatience.

‘Go back, Elsie, eight years, if you can. Remember the wretched business of our unworthy brother.’

‘I remember it. Not unworthy, Hilda. Our most unfortunate brother. Why, they have found the very notes he was charged with stealing. They were found in the safe on the very day when they made the other discovery. Have they not told you?’

‘Checkley told Sir Samuel. He also remembers seeing Athelstan place the packet in the safe.’

‘Oh! Does he dare to say that? Why, Hilda, the robbery was proved to lie between himself and Athelstan. If he saw that, why did he not say so? He keeps silence for eight long years, and then he speaks.’

Hilda shook her head sadly. ‘I fear,’ she said, ‘that we cannot accept the innocence of our unfortunate brother. However, Athelstan was accused of forging Mr Dering’s handwriting and signature. In this new forgery, the same handwriting is found again—exactly the same. The forger is the same.’

‘Clearly, therefore, it cannot be Athelstan. That settles it.’

‘Yes—unfortunately—it does settle it. Because, you see, Athelstan is in London. He is said to have been living in London all the time—in some wretched place called Camberwell, inhabited, I suppose, by runaways and low company of every kind. He has lately been seen in the neighbourhood of Gray’s Inn, apparently passing under his own name. Checkley has seen him. Another person has seen him.’

‘Have you come to tell me that Athelstan is charged with this new wickedness?’

‘The forger must have had an accomplice in the office; a man able to get at the safe: able to intercept the post: acquainted with Mr Dering’s ways: such a man as—say—Checkley—or—the only other possible—George.’ Hilda paused.

‘Oh! This is too absurd. You are now hinting that George—my George,’ she said proudly, ‘was the confederate of Athelstan—no—of a forger.’

‘They have been seen together. They have been seen together at the house from which the forger addresses his letters. Has George told you that he has known all along—for eight years—of Athelstan’s residence in London?’

Observe how that simple remark made in the *Salutation Parlour*, that Athelstan must have been living in Camberwell, had by this time grown into a complete record of eight years’ hiding, eight years’ disgraceful company, on the part of one; and eight years’ complicity and guilty knowledge on the part of the other. Hilda had not the least doubt. It was quite enough for her that Checkley said so. Half the contents of our newspapers are conducted on the same confiding principle.

‘If George has not told me,’ Elsie replied, ‘it must be for some good reason. Perhaps he was pledged to secrecy.’

‘My dear’—Hilda rose impressively with fateful face—‘the hand that forged the letters is the hand that forged the cheque—your brother’s hand. The hand that took the certificates from the safe’—she laid her own upon Elsie’s hand—‘the hand of the confederate, my poor sister is—your lover’s hand.’

‘I knew,’ said the girl, ‘that you were coming to this. I have felt it from the beginning.’

‘Remember, the thing was done in the months of February, March, and April. First of all, Athelstan was then, as now, desperately poor: the life that he has led for the last eight years—the life of a—a—Camberwell profligate’—she spoke as if that respectable suburb was the modern Alsatia—‘has certainly destroyed whatever was left of honour and of principle. There comes a time, I have read, in the career of every wicked man when he hesitates no longer whatever means are offered him of making money. Athelstan it was—so they believe—who devised this scheme, which has been as successful as it is disgraceful. My dear Elsie, this is the most terrible disgrace that has ever befallen my family: the most dreadful and the most unexpected calamity for you.’

Elsie caught her sister by the wrist. ‘In the name of God, Hilda, are you telling me what is proved and true, or what is only suspected?’

‘I am telling you what is as good as proved. More than suspected.’

‘As good as proved. Oh!’ Elsie drew a long breath. ‘As good as proved. That is enough. Like Athelstan’s guilt eight years ago,’ she flared out suddenly, springing up again and walking about the room. ‘Oh! it is wonderful!’ she cried—‘wonderful! What a family we are! We had a brother, and we believed that he was an honourable gentleman, as the son of his father must be. Then there was a charge, a foolish charge, based upon nothing but may—have—been and must—have—been— We believed the charge’—

‘Because we had no choice but to believe, Elsie,’ her sister interrupted. ‘Do you think we wanted to believe the charge?’

‘We should have believed him innocent until the thing was proved. We did not. We cast him out from among us; and now, after eight years—he has come back poor, you say, and sunk so low that he is ashamed to see his people, and we are going to believe another charge based on may have been and must have been. No, Hilda. I will not believe it—I will not.—And then there is George. If I cease to believe in his honour and his truth, I cease to believe in everything. I cannot believe in Heaven itself unless I believe in my lover. Why, his heart is light about this business: he is not concerned: he laughs at that old man’s ravings. Ravings? If Athelstan is right, then his is the hand that has done it all—his—Hilda—Checkley is the man concerned with both crimes.’

Hilda shook her head. ‘No, Elsie, no. The old man is above suspicion.’

‘Why should he be above suspicion more than George? And you ask me on the first breath of accusation to treat George as you treated Athelstan. Well—Hilda, I will not.’

‘I make every allowance for you, Elsie. It is a most dreadful business—a heart-breaking

business. You may misrepresent me as much as you please—I will continue to make allowances for you. Meantime, what will you do?

‘Do? What should I do? Nothing, nothing, nothing. I shall go on as if this thing had never happened.’

‘Sir Samuel ordered me to warn you most seriously. If you consent to see him again’—

‘Consent? Consent? Why should I refuse? In a fortnight he will be my husband and my master, whom I must obey. He calls me his mistress now, but I am his servant. Consent to see him?’ She sat down and burst into tears.

‘If you see him again,’ her sister continued, ‘warn him to leave the country. The thing is so certain that in a day or two the proofs will be complete, and it will then be too late. Make him leave the country. Be firm, Elsie. Better still refuse to see him at all and leave him to his fate. What a fate! What madness!’

‘We allowed Athelstan to leave the country. He ought to have stayed. If I advise George at all I shall advise him to stick to his post and see the business through. If he were to leave the country, I would go with him.’

‘You are infatuated, Elsie. I can only hope that he may fly the country of his own accord. Meantime, there is one other point’—

‘What is it? Pray, don’t spare me, Hilda. After what has gone before, it must be a very little point.’

‘You are bitter, Elsie, and I don’t deserve your bitterness. But that is nothing. At such a moment everything must be pardoned and permitted. The point is about your wedding. It is fixed for the 12th of next month, less than three weeks from to-day. You must be prepared to put it off.’

‘Indeed? Because you say that a thing impossible is as good as proved! Certainly not, Hilda.’

‘I have come here to-day, Elsie, by Sir Samuel’s express wish, in order to soften the blow and to warn you. Whether you will tell—that unhappy young man or not, is for you to decide. Perhaps, if you do, he may imitate our unworthy brother and run away. If he does not, the blow will fall to-morrow—to-day—the day after to-morrow—I know not when. He will be arrested: he will be taken before a magistrate: he will be remanded: he will be out on bail. Oh, Elsie, think of marrying a man out on bail! One might as well marry a man in convict dress. Oh! Horrible!’

‘I would rather marry George in convict dress than any other man in fine raiment. Because, once more, the thing is impossible.’

‘You carry your faith in your lover beyond bounds, Elsie. Of course a girl is right to believe in a man’s honour. It makes her much more comfortable, and gives her a sense of security. Besides, we always like to believe that we are loved by the best of men. That makes us feel like the best of women.—But in this case, when I tell you that Sir Samuel—a man who has always lived among money—so to speak—and knows how money is constantly assailed—is firmly convinced of George’s complicity, I do think that you might allow something for human frailty. In the case of Athelstan, what did Mr

Dering say? Everything is possible. So I say of George Austin, everything is possible.’

‘Not everything. Not that.’

‘Yes, even that.—What do you know of his private life? Why has he concealed the fact of Athelstan’s residence in London? Why has he never told us of his friendship with that unfortunate outcast?’

‘I don’t know. He has his reasons.’

‘It is a most dreadful thing for you,’ Hilda went on. ‘And after getting to believe in the man and—well—becoming attached to him—though such attachments mean little and are soon forgotten—and after going the length of fixing the day and ordering the dress and the wedding-cake and putting up the banns— Oh! it is a wretched business—a horrible misfortune. The only thing to be said is that in such a case, the fact being known to everybody, no one can blame a girl; and perhaps, in the long run, she will suffer no injury from it. Our circle, for instance, is so different from that of this young man’s friends, that the thing would not even be known among us.’

‘I believe, Hilda, you will drive me mad.’

‘My dear, one must look ahead. And remember that I look ahead for you. As for the young man, I dissociate him henceforth from you. What he does and where he goes I do not inquire, or care about any more than I trouble myself about a disgraceful brother. Some acts cut a man off from his mistress—from his sisters—from the world.’

‘Do not talk any more,’ said Elsie. ‘Let the blow, as you call it, fall when it pleases. But as for me, I shall not warn George that he is to be charged with dishonesty, any more than I will believe him capable of dishonesty.’

‘Well, my dear, there is one comfort for us. You may resolve on marrying him. But a man charged with a crime—out on bail—cannot marry any girl. And he will be charged, and the evidence is very strong.’

‘No doubt. As good as proved—as good as proved. Poor George! Who never had ten pounds in the world until he was made a partner’—

‘True. And there we have the real motive. Seek the motive, Sir Samuel says, and we shall find the criminal. Here you have the reason of the secret partnership with Athelstan. Poverty is the tempter—Athelstan is the suggester.’

Elsie shook her head impatiently.

‘Mr Dering was to give you away. Who will now? Athelstan? How can we—Sir Samuel and I—assist at a wedding where the bridegroom lies under such a charge? by one so near to us as Mr Dering? How can your mother be present? Oh, Elsie—think!’

Elsie shook her head again, with greater impatience.

‘Think what a fate you may be dragging upon yourself! Think of possible children with such a brand upon them!’

‘I think only of an honourable and an innocent man.’

‘I have just come from my mother, Elsie. She says positively that if the charge is brought, the wedding must be put off until the man is cleared. And for the moment she does not feel strong enough to meet him. You can receive

him here, if you please. And she desires that there may be no disputes or arguments about it.

'It is truly wonderful!' Elsie walked to the open window and gasped as if choking. 'Wonderful!' she repeated. 'The same fate—in the same manner—threatens George that fell upon Athelstan. And it finds us as ready to believe in the charge and to cast him out.—Now, Hilda, go to my mother and tell her that though the whole world should call George—my George—a villain, I will marry him. Tell her that though I should have to take him from the prison door, I will marry him. Because, you see, all things are not possible. This thing is impossible.'

'We shall have trouble with Elsie,' Lady Dering told her mother. 'Call her soft and yielding? My dear, no mule was ever more stubborn. She will marry her convict, she says, even at the prison door.'

THE EVERLASTING HILLS.

It is not surprising that the Hebrews and others of old time should have looked upon the hills as 'everlasting'—at least in the sense of lasting as long as the world itself. But to the present age they have at last told something of their story, and have declared themselves to be but temporary phases in a landscape which has been and ever will be undergoing slow but continual change. The beautiful hills of our own native land have the same doom of decay and death written upon them. They have not ever been where we now see them—in Scotland, Wales, or Cumberland. Nor will they ever remain. Like other things, they 'come and go,' and cannot be said to be 'everlasting.' It will be our endeavour in the present paper to expound this important truth, and to show in simple language how mountains are made, how they get their varied outlines, and how they finally suffer destruction—in fact, to trace the cycle of changes through which they pass, and to point out that, like living things, they have a life-history of their own.

Mountains play a very important part in the economy of the world, purifying the air, supplying soils for the plains, and creating streams and rivers, which bring life and fertility with them. But on this aspect of the hills we cannot dwell now. Enough if we can briefly trace their birth, growth, and death or destruction. Our Poet-laureate has aptly expressed the truth we wish to expound, in the words:

The hills are shadows, and they flow
From form to form, and nothing stands;
They melt like mists, the solid lands,
Like clouds they shape themselves to go.

In dealing with the geological aspects of the subject—that is, with the origin and mode of formation of mountains—we find that the subject naturally falls into three divisions: (1) We must consider how the stony rocks of which mountains are composed are brought together and compacted. (2) How mountains reach their present elevated positions; and (3) How they assumed their present outlines, and were carved out into all those wonderful details which afford us so much joy in beholding, of valley and peak, of crag and pinnacle and precipice. A simple illustration will

make this quite clear. Suppose we were standing in front of a great and beautiful cathedral, such as Amiens, and trying to picture to ourselves how it was created. We should have to consider how the separate stones of which it is composed were brought together; how they were elevated to their present positions; and lastly, how their graceful outlines were given to them. Thus the work divides itself into three divisions—transportation, elevation, and ornamentation. A little reflection would convince us that the transportation was effected by a system of carts and horses hauling stone from quarries far and near; that the elevation was effected by men working with ropes and pulleys to get the stones into position; and that the ornamentation was accomplished by masons armed with hammer and chisel, who day by day carved the rough blocks into tracery, finials, figures, &c. To make the comparison complete, we should suppose that *all* the carving was done after the stones had been put in their places; but this, probably, was not the case. Let us take each of these operations in turn, and endeavour to trace their workings, in order to gain a clear idea of the history of Nature's cathedrals, not made with hands, and far more wonderful and beautiful than those earthly temples to which we have compared the mountain masses of the world.

First comes the work of transportation, or bringing together of the vast amount of rocky material contained in a mountain chain. It is evident that they have been brought together; for one of the first facts to be learned by examining almost any groups of mountains would be that their rocks are composed of layers, called 'strata' by geologists, and that the layers themselves, when closely looked into, prove to be made up of particles or grains of various sizes. We are not speaking now of volcanoes, which have quite a different origin; or of volcanic rocks, such as granite and basalt, which are frequently to be found in mountainous districts; but of mountains generally it may be said that they are built of stratified materials, such as clays, sandstones, and limestones, in some form or other. These materials may have been altered by heat and pressure—when deeply buried below the earth—into their respective metamorphic forms—namely, slates and schists, quartzites and marbles; but that does not affect the general statement just made. Now it is proved beyond doubt that all such rocks, with very few exceptions, have been formed or put together under water. Some were deposited in ancient seas, others in lakes and estuaries, mostly by a simple process of settling down or a deposition. This, however, does not apply to the limestones, which are chiefly built up of the remains of marine calcareous organisms; it is hardly necessary to add that the layers or strata thus formed are horizontal. This constitutes an important axiom in geology, and whenever we find strata in inclined or elevated positions, it may be safely concluded that some subsequent influences have been at work to raise them from their native horizontal. Hence it is clear that all mountains, except volcanoes, have been raised up. The rocks of our continents must also have been lifted up out of the seas wherein they were formed. But in their case the disturbance

has been comparatively slight compared with the violent flexures and foldings to which the highly bent and contorted strata of mountains testify.

Let us now inquire into the source of the great supplies of material necessary to keep up the work of rock-building which is still going on, as it went on throughout geological time. Of the limestones we have already spoken; to explain their origin would require a separate paper; but we may briefly consider the case of the clays and sandstones. They are derived from the wear and tear of continents and islands. All lands are more or less exposed to atmospheric influences, and the destructive effects of rain and rivers. Any old weather-beaten building will serve to show that even hard stone can be corroded and worn down by rain and wind, &c. This illustrates on a small scale what Nature does on a large one. 'Nothing stands.' All, even the most stubborn rocks, must in time suffer decay at the hands of the elements. It would take too long to describe how this is accomplished; but to put it briefly, the atmosphere, by means of the oxygen and carbonic acid it contains, exerts a decaying influence on all rocks, and so facilitates their further destruction. Changes from heat to cold will often cause rocks to split. When water gets into the joints and freezes, it acts like a powerful wedge—on account of expansion—and so breaks off portions of rock, mountain tops, and peaks; the sides of the cliffs must be greatly broken by this means, and the sides of mountains frequently show masses of loose angular débris which has fallen from above. Then come the mountain streams running down their valleys, and carrying with them the débris of rocks higher up, rubbing off their corners and wearing them away, till finally nothing but tiny grains of mud and sand are left, like the sandy mud formed on a grindstone after using it. As fast as the mountain sides and crags split up, their débris is thus ground up and carried away. Streams, rivers, and glaciers are all great transporting agents, bringing down these materials—as well as the soils which represent decayed and broken rocks—from higher to lower levels, from the mountains down to lakes and seas. Again, the streams, rivers, and glaciers are all powerful agents of erosion as well as of transportation. Even a small stream can, if its fall is rapid, cut a deep ravine out of solid rock. With a sufficient velocity, it may in time accomplish a vast amount of rock-cutting. The grandest examples of this kind of action are the cañons of Colorado, from three to six thousand feet deep!

Thus we see that the débris of the land is finally swept into the sea: these are the agents that 'draw down Æonian hills, and sow the dust of continents to be.' Thus the sea is the great workshop where all these land-derived materials are brought together, and slowly settle down in horizontal layers, thus forming new strata out of old ones. They will in turn suffer elevation, be converted into dry land, and some day be again brought under the destructive influences of denudation. There is thus a never-ending cycle of operations taking place; and just as Cairo has been built of stone derived from the Pyramids, and the lost city of Memphis,

which the Arabs used as quarries, so the lands of one age are used by Nature to build up the continents of the future. If some of her actions are destructive, others, again, are constructive; and thus one set of operations is balanced by another, and harmony is the result.

We have now to consider the second stage in the life-history of a mountain chain or mass—namely, elevation; in other words, how did the strata get raised up, in some cases to heights over twenty thousand feet?

That they have been raised up follows as a consequence from the proposition that they were deposited in seas, lakes, &c.; and if further evidence were needed, in the numerous contortions, crumplings, and foldings—the last often on a prodigious scale—exhibited in the strata themselves; and it is probable that at times they have been convulsed in their upward struggle. For we often find that they have been fractured by the crushing and upheaving forces to which they have been subjected. In fact, fractures are numerous in all disturbed regions, and perhaps each fracture gave rise to an earthquake! But still Lyell's theory of Uniformity in all geological operations has so greatly advanced the science of geology, that some have carried it too far, and we must admit that occasionally even quiet processes may become violent. Thus, we may imagine the gentle upheaval of a mountain range to continue quietly for a long period, until at last the tension of the rocks becomes more than can be borne, and they snap violently; and then a considerable disturbance would result.

There is abundant evidence to show that slow movements both of elevation and subsidence are now taking place, and have been going on in every geological age, as well as within the human period; but to account for such movements is another matter. At first, the attempt seems rather hopeless. Where are we to look for a force sufficient to raise continents, throw up and crumple the rocks into mountain chains? But I think we shall be able to offer a reasonable explanation, and to find a force sufficient even for this task. Until recent years, it was usual to ascribe this work to the energy which displays itself in volcanic phenomena, or in other words to heat. But this was a false theory. Heat has much to do with both volcanic action and the upheaving of rocks; but the energy of volcanic eruptions must be attributed to highly-heated and compressed steam—supplied by the water contained in deeply-buried rocks—whereas the earth-movements we are now considering cannot be shown to be due to the same cause, but rather to one of an opposite kind—namely, loss of heat.

Let us bear in mind that the earth is a cooling globe. Modern science teaches that it was once red-hot, and has been slowly cooling through subsequent ages. Few will dispute this theory when they look into the evidence. Taking this supposition for granted, let us inquire into the consequences following from it. We know that nearly all solid bodies contract on cooling. So does the earth; and the hotter portions below the surface—although solid—contract faster than the cooler and more rigid external crust. The consequence is that the outer shell of the earth

is in some places left unsupported. Its weight, which must be prodigious, soon begins to tell, and it gradually sinks, in order to adapt itself to the smaller surface below. Now it cannot do this without becoming wrinkled and thrown into numerous folds. We see this well illustrated in the case of a dried apple, the skin of which, owing to shrinkage below, has become creased. An old person's hand or face shows the same thing. And so we must regard mountain chains as wrinkles on the face of Mother Earth, telling us that she is no longer in the freshness of youth. We have in this process a very powerful force let loose, as it were—namely, gravitation acting upon great masses of strata. This is great enough to account for all the phenomena. Even in coal-mines the unsupported strata of the roof will 'creep' or slowly settle down. Now the result of the subsidence on a large scale will be lateral pressure at right angles to the chief folds, drawing the strata up in ever-increasing folds towards the main chain, so as to get them into a smaller horizontal space. The elevation will of course be greatest where the folds are greatest; and the folds on either side of the mountain range will get less and less as we pass from the range, until we come to a kind of arch, or a slight upheaval constituting a continent. Mountain ranges, then, are the backbones of continents.

This very acceptable theory, thus briefly explained, seems to account for all the facts, and shows that the same agency—namely, secular cooling of the earth—crumples strata into mountain chains and heaves up continents. The big downward folds beyond the continents will be the troughs of oceans, for there must be downward as well as upward folds. This theory will also account for volcanic and earthquake action. It seems to harmonise and bring into definite relations a mass of facts otherwise unintelligible. In most mountain chains the strata show that they have undergone considerable changes in their mineral composition and general state. Clay-slates, quartzites, mica, schists, and gneisses are but altered forms of ordinary clays and sandstones. And perhaps even granite is but a highly altered form of clay-slate which has been melted and slowly cooled under pressure. These and other facts connect volcanic action with the upheaval of mountain chains, and so with metamorphism. But whether the heat necessary to accomplish all this was supplied by the crushing force thus brought into operation—according to Mr Mallet's view—or is part of the earth's internal heat, it is hard to say. But all those who are familiar with mountains will have noticed the crystalline character of the rocks of the elevated axes, and will admit a close connection between rock-crumpling and metamorphic action. The most beautiful gems and most valued mineral ores are generally found in mountainous countries. We do not look for silver and gold in the chalk downs of Surrey, or for tin and lead in the London Tertiaries; but we may find them in crumpled rocks of Cornwall, Wales, or Scotland.

It now only remains to consider the third question of ornamentation, and to explain briefly how mountains get their rugged and varied outlines. And first, it is necessary to remark that

in no cases are the outlines of mountains due directly to the folds and crumpings of which we have spoken. Of some minor folds, such as the Jura mountains, that is true; but these are exceptions. We must look not to internal structure but to external influences to account for the forms of mountains. Their sloping or rounded sides, towering crags and pinnacles, their precipices and deep valleys, are all due mainly to those atmospheric and denuding influences to which we have already alluded. Atmospheric decay, frost, heat, and cold, all play an important part in carving away at the more exposed parts of mountains, and help to carve them out into their wonderful shapes, which will be partly determined by the directions of their natural divisions, and partly by the nature of the rocks themselves; the positions of the strata also have an influence in determining shapes. An arch or 'anticline' will be worn away, being somewhat broken open and loosened; while a trough or 'syncline,' being more compact, and held together by lateral pressure, will more readily withstand denudation. Hence, single mountains are often synclines, while valleys are often broken and denuded 'anticlines.' Sometimes the highest peaks consist of strata standing right up on end, so that their destruction is less easily accomplished, and they last while other parts go. The joints and planes of stratification, &c., are the lines along which denuding agents work, just as quarymen do.

But rain and rivers, snow and ice, are the chief agents at work carving out mountains and making the larger features. They are the masons continually at work on rocks; and their tools are streams, rivers, and glaciers. Streams and rivers carve out glens and valleys, thus making important features among the hills. Moreover, they bring down the rocky fragments which roll down mountain sides, rubbing off their corners, rounding them, and grinding them down to pebbles, and finally even into sand and mud. Thus the mountains are once more reduced to dust, from which they came. In mountains like the Alps, glaciers exert a considerable influence in deepening their valleys and transporting débris from higher to lower levels. They have formerly scratched and rounded the mountains of Wales, Cumberland, and Scotland, and their moraines are in many cases still left.

But water is the great denuding agent. We little think as we see the clouds hanging over the hills, that, soft and innocent and beautiful as they look, they yet are the instruments of destruction; for they contain the water, in the form of tiny suspended globules, which will in time work such wonders when they go together to form raindrops, and these are impelled by the winds or driven by gravitation down a rocky glen! The words of the Ettrick Shepherd express a scientific truth:

Who was it scooped those stony waves?
Who scalped the brows of old Cairngorm?
And dug these ever-yawning caves?
'Twas I, the Spirit of the storm.

It is almost incredible to what an extent some mountains have suffered at the hands of the various agents of denudation. In many cases thousands of feet of solid rock have been removed

from off the tops of mountain ranges, so that they are often mere stumps as to what they once were. Now, as before pointed out, all the *débris* goes into the seas, or lakes and estuaries, there to be reconstructed into rock. Thus we see that there is a continual cycle of change taking place, destruction being balanced by construction, and the two going on side by side. Thus we have shown that mountains go through a cycle of changes, and that the title at the head of this article is but a poetic fancy, and that the hills must as inevitably pass away as a flower must fade and die. But in their death and destruction we see that Nature is but laying the foundations of future hills, islands, &c., that even for them there is a kind of resurrection. In the words of Mr Ruskin, who has taught many true lessons from Nature to this generation: 'Death must be upon the hills, and the cruelty of the tempest must smite them, and the thorn and the briar spring up upon them; but the tempests so smite as to bring their rocks into the fairest forms, and the flowers so spring up as to make the very desert blossom as the rose.' As of the hills, so of ourselves we may say: 'Dust thou art, and unto dust shalt thou return.' So it is with the whole earth and with the heavens: 'They all shall wax old as doth a garment, and as a vesture shalt thou change them, and they shall be changed.'

MAJOR RANDALL'S WARNING.

BY JESSIE MACLEOD.

IN THREE PARTS.—PART I.

ONE wintry evening, Major Mark Randall, of the 14th Regiment of Hussars, home on leave from Madras, descended from the train bound to York at a small station on the line to Boston, Lincolnshire. Although a tolerably fine day when he left London, it soon after began to rain, and increased to a steady downpour. In that retired country district it was dark as if late at night. The Major, carrying a small portmanteau in one hand, a stout stick in the other, was well protected by a thick ulster; and lighting a cigar, he set off on a cross-country walk he had known well enough in bygone years. He was bound to an old mansion at about four miles' distance, on a few days' visit to his maiden aunts, whom he had begged not to send a carriage to meet him at the station, as, having business matters to transact in London, the hour of his arrival would be very uncertain. Probably he now repented of this decision, for, after proceeding some yards, he turned back towards the station.

'I suppose it would be impossible to procure a conveyance over to Cressing Hall?' he called out to the porter, who was watching him from the door.

'Yes, sir. Unless bespoke, you'll not get nothing on wheels to-night. If you're bound to the Miss Ingestres', you'd better not go by the footpath. We've had so much rain of late, the drains is overflowed, and the waters is out.'

'But the road takes such a turn; it is nigh three miles longer,' said the Major.

'Better go a long tramp than take a short-cut to get drowned,' returned the porter.

Major Randall laughed; but having lived too long in the world to despise local advice, he took the road. Even that was by no means safe; the drains, as they are called in that county, are in reality very deep canals, skirting the roads, with unprotected sides, and very easily walked into by a person ignorant of the locality.

The officer started at first briskly; but the rain fell so fast that the atmosphere was blinding as a curtain, and he deemed it most prudent to proceed at a footpace. Even on a black night, there is a faint earth light on country roads; it was just sufficient for him to see the stones in their centres. He often lighted a fusee, but, unfortunately, they were soon exhausted. Occasionally, he saw the glimmer of a distant light, probably from a cottage window; but knowing that he was in the Fen county, he did not venture to seek it. The roads were perfectly open and unsheltered; if trees bounded them, they were tall poplars, affording no screen. And now the rain descended like a waterspout.

'A pleasant night this to be out in,' exclaimed a voice at his elbow, and he heard feet splashing through the slush beside him.

'Perhaps we may reach a road-side cottage,' said the Major.

'There are none. But I'll tell you what there is a little farther on—Bertoft old church; it has a porch.'

'That will do,' said the officer; and the two quickened their pace.

'Here it is,' cried the newcomer, presently darting to a lichgate, that, being painted white, stood out ghostly through the gloom. A short gravel path led across the ancient churchyard, bordered with tombstones, to the ample porch, with oaken seats on either side, and well protected from the rain.

'This is a famous shelter,' said the Major. 'If you have a fusee, I will offer you a cigar.'

'Thank you,' replied his companion; 'I never smoke.—Listen! There is the cry of a bittern; this must be the clearing-up shower; they do not cry unless the rain's going off. I shall not be sorry to get home, for I missed my train, and have a long walk to reach Boston.'

'I hope you know the roads well?'

'By heart,' answered the other. 'It's a pity that we have so much water in these parts; it gives Lincolnshire a bad name; and there's not a nicer county in England in summer-time; it smells of nothing but hay and clover; and the variety of grasses is wonderful to them as understands them.'

At this instant the church clock in the old tower above deliberately struck the quarters and then the hour of seven.

'It's getting late,' continued the stranger, whose voice was cheery and pleasant. 'I suppose I must be going on, bad as it is. I've had nothing but ill-luck to-day. It did not rain when I started to call on a person at Roby I particularly wished to see; but he was out. Then I missed the train; and am almost drenched to the skin; though that can't hurt me: we Lincolnshire folk are said to be half-frogs, you know;' and he laughed merrily.

'If I remember rightly,' said the Major, 'this road divides at Bertoft.'

'Yes. One goes to Boston, the other to Spald-

ing. We are about a mile from the village. Bless you ! watery as it is hereabouts, it's nothing to what it was once. In this churchyard they only dug the graves just in time for the funerals, for they filled with water directly ; and as for Bertoff, I've heard my grandfather say he and another rowed through the village to the general shop to buy their stores ; and shot wild-ducks in the fields close by ; so that their boat was laden with provisions on the road home. My grandfather was a good shot ; he'd been a soldier, and went through the Crimean War. These parts must have been bad in his day ; them drains has done a sight of good.—And now, I'll wish you good-night, sir.'

'Good-evening,' said the Major ; 'and I hope, for both our sakes, it will soon cease raining.'

He heard his companion, whose voice and words seemed those of a young man, walk quickly to the gate and his splashing footsteps die away in the distance. The darkness was such that he never saw him, therefore, had no idea of his appearance. The conversation they held together was short and trifling, yet destined to be words of intense importance to one of them.

After waiting some little time, the rain abated, and the Major resumed his journey, reaching his destination at half-past eight o'clock, tired with his long tramp, and very wet. His arrival caused quite an excitement, for the Miss Ingestres had given him up.

How familiar yet how different did these ladies appear to him—welcoming the bronzed, bearded soldier with the same voices, in their former affectionate manner, standing in the identical places in the entrance hall as in bygone years, when he visited them regularly at the vacations. Nothing had changed save themselves ; the fine middle-aged women he had left were now two thin, wrinkled, old ladies—kind as ever, but more fussily so. As for himself, the gay heedless youth was now the tall experienced soldier of many battles, who had more than once been wounded.

After the first surprise at his changed appearance was over, they soon forgot it, and he was the 'dear boy' of former years. Seated at the hospitable table, where an admirable impromptu dinner was got up for him, adorned with its silver and crystal, also flowers brought in from the conservatories, surrounded by luxury, a splendid fire on the hearth, the red velvet curtains closely drawn, the carved oak furniture as he remembered it, and old family portraits on the walls—it was difficult to realise that he had been absent seventeen years, living what seemed a lifetime of change and peril. Here was unaltered peace. All he missed were the silver-haired butler, who had served his maternal grandfather, and the old hound Toby, who had been his companion in many a ramble.

'And have you been going on the same life here all these years?' he asked.

'Yes, dear boy—as you left us, so you find us. We have been several times to London just to get food for the mind, as I may say—new books, new music, to hear famous preachers, and to attend a few lectures at the Royal Institution, and a concert or two. But there is no place like home. When we are away, things go wrong, and the poor people miss us. We lead quiet lives.

Your letters were a great delight to us, and sometimes caused us much anxiety. We have followed you all through your career, dear Mark.'

'I feel as if I had never been away ; and awakened from a long sleep full of dreams,' said the Major.

'You will not know Caroline when you see her,' said Aunt Lydia. 'She was a bride when you left ; now, her eldest boy is at Eton ; and as for her husband, who was such a waltzer, he cannot get a hunter strong enough to carry him.'

'Time brings its changes,' said the Major. 'I have a few visits to pay when I leave you ; then I shall run down to Worcestershire and have a look at them.'

This referred to Major Randall's only sister, after whose wedding he had left for India.

There was no rain the following morning ; and the Miss Ingestres, well wrapped up, insisted upon marshalling their long-absent nephew about the grounds to see the improvements. On returning through the gardens, they were met by the head-gardener, who stopped touching his hat.

'Beg your pardons, ladies, but there's such shocking news.'

'Indeed !' cried Miss Ingestre, looking startled.

'Yes, mum. Mr Twyford, the miller at Roby, was shot dead as he was riding home from Merstoke last night.'

'Shot ! Old Mr Twyford shot !'

'What a dreadful thing !' cried Miss Lydia.

'He was coming home along the high-road, it seems, on Gray Dobbin, an old hoss as could find the way blindfold. It was a bad night, we know ; but through the noise of falling rain, a woman in a cottage heard two shots fired. She ran to the door just in time to see the hoss galloping away skaired ; so she fetched a lantern, and found Mr Twyford lying in the road. She got help ; but the pore old gentleman was dead—shot through the heart.'

'Was he robbed?'

'No, mum. That's the strange part of it ; his puss and pocketbook was untouched. There's a regular hue and cry through the county to find the murderer, folks is so sorry. Old Mr Twyford was as well known as Boston Stump.'

'You remember him, dear Mark, do you not?'

'I had forgotten his name ; but I recollect going several times with the Vicarage boys to be weighed at the mill. He was a tall man, I think. His wife used to bring us out cowslip wine. There was a daughter too—a young, timid, slip of a girl,' said the Major, turning his thoughts backward.

'Ah ! she grew up the beauty of the county. People would ride past the mill to try and get a peep at her. I have seen many beautiful girls, but never one so perfectly lovely as poor Elizabeth.'

'Why do you say poor ? Is she dead?'

'She may be ; there has been no news of her for some years. Mrs Twyford died, though ; and perhaps Elizabeth had too much her own way. She went on a visit, and became acquainted with a showy man who called himself a gentleman. No doubt he was an adventurer, for it was well known the miller's daughter would have a good fortune. He paid his addresses to her ;

but Mr Twyford forbade him the house. Sad to say, Elizabeth eloped with him.'

'No doubt the unprincipled man counted on the father's forgiveness, for he doted on his daughter. She might have married well, for all the young men in these parts were in love with her, she was so amiable. Anyhow, the miller defeated him, for he disinherited Elizabeth. It nearly broke his heart, though, for he seemed to become an old man all at once,' said Miss Lydia, taking up the thread of the narrative. 'It was very undutiful of her; but I suppose she was led away by the man's good looks.'

'The old, old story,' remarked Major Randall. 'I wonder how often it has happened, and will happen again.'

'It will be the same as long as there are serpent tongues,' said Miss Ingestre with asperity.

THE LATE EXPEDITION TO LABRADOR.

EARLY in the spring of last year a party of scientists, under the direction of Professor Lee, of Bowdoin College, left the United States for the purpose of exploring the interior of Labrador, and to study the geology of that interesting region, after the example of Professor Hind, who geologically 'did' a large part of that peninsula some years ago. Lost to sight for many months, and without even the pen of a newspaper reporter, the scientists seem to have passed through many exciting experiences and some trials. They have just returned to the haunts of civilisation again, bringing with them rich stores of new information pertaining to the geology of sterile Labrador, which is therefore no longer to be considered the *terra incognita* it has hitherto been, and which, strange to say, its neighbour, Newfoundland, is even at the present moment. In addition to other matters of interest, Professor Lee's party claim to have made two discoveries, which are not discoveries at all in the commonly accepted sense of that term. There is first the waterfall which the travellers found somewhere not far removed from Ungava, and which they represent to be a far bigger thing in all respects, as we have no doubt it is, than Niagara. It is unquestionably a matter for gratulation to have looked on this magnificent cataract, and to be the first to give to the world some idea of its vast proportions; but its existence has been known of for years past, though not perhaps by many outside of Labrador itself. Falling in with a party of Indians some eight years ago, while cruising on the coast of Labrador, we heard about it from them, though they could give us no idea of its size save that which 'big' would convey to our minds. Later, it formed the subject of a very interesting conversation between ourselves and an agent of the Hudson's Bay Company who had been living on the coast for more than seventeen years. He had not seen the cataract, but had frequently heard of it from the Indian trappers in the company's service.

Again: a correspondent of the *Graphic*, of October 3d, credits the members of the Lee expedition with the noteworthy achievement of

discovering, amid the wilds and solitudes of Labrador, a tribe of Indians of whose existence even ethnologists have hitherto possessed no knowledge. If this be so, the fact is of great interest, though we are convinced that these supposed unidentified red men can be no other than a remnant of the once powerful and numerous Beothic tribe, the aborigines of Newfoundland, who were driven from their own country by the malevolence and wanton cruelty of the early settlers from Britain, and the jealous Mic-Macs from Prince Edward Island and Nova Scotia. The following facts give considerable colour to our conjecture. A tradition still lingers among the settlers of Northern Newfoundland, with whom we lived for some years, that the last of the Beothics, a mere handful, passed across the Strait of Belle Isle in two canoes early in the present century, and having landed somewhere on the south coast of Labrador, had disappeared. This tradition is materially strengthened by the testimony of the late Dr Mulock, Roman Catholic Bishop of St John's, Newfoundland. He says: 'I have slight reason to think that a remnant of these people [the Beothics] survive in the interior of Labrador. A person told me there some time ago that a party of Montagnais Indians saw at some distance—about fifty miles from the sea-coast—a party of strange Indians, clothed in long robes, or cassocks of skins, who fled from them. They lost sight of them in a little time; but on coming up to their tracks, they were surprised to see the length of their strides, which proved them to be of a large race, and neither Mic-Mac, Montagnais, nor Eskimos. I believe,' he concludes, 'that these were the remains of the Beothic nation; and as they never saw either a white or red man but as enemies, it is not to be wondered at that they fled. Such is the only trace I can find of the Beothics.'

Early in the present century, but a short time before their supposed extinction, a few individuals of the Beothic tribe were captured by explorers in the Exploits River regions in Newfoundland and taken to the capital. But after spending a few months there, they either returned to their tribe or died of consumption. About that time, too, several proclamations were issued by the British Government to restrain the barbarity of the settlers towards the Beothics. The earliest official notice of the aborigines is in the form of a proclamation by the governor bearing date of 1760. This proclamation seems to have been repeated on the accession of each new governor. The document sets forth that His Majesty had been informed that his subjects in 'Newfoundland do treat the savages with the greatest inhumanity, and frequently destroy them without the least provocation or remorse. In order, therefore, to put a stop to such inhuman barbarity, and that the perpetrators of such atrocious crimes might be brought to due punishment, His Majesty enjoined and required all his subjects to live in unity and brotherly kindness with the native savages; and further enjoined all magistrates to 'apprehend persons guilty of murdering the native Indians and send them to England for trial.' Owing to the scattered nature of the settlements and the lawless habits of the early trappers and fishermen, these proclamations were systematically disregarded. But

a short time after, the only traces that were visible in their native country of the unfortunate Beothics were a few grassy mounds, decaying deer-fences, and ruined wigwams.

A MESSAGE FROM THE FLOOD.

It was a curious sight to Portside eyes, such a sight as the younger generation had never seen before. Three miles below lay Portside itself, the cathedral tower looming misty through the hazy January afternoon, while black cold night crept up from the stern frosty east. For five weeks the earth had lain under a canopy of snow; for five weeks work had been at a standstill; and now the river Swirle had frozen over, and for three miles a solid sheet of ice stretched away, and the ring of steel blades echoed in the bare woods. For thirty-seven years the Swirle had defied the grip of King Frost, and even in the terrible winter of 1854 there had only been some few hundred yards of firm ice; whilst now the river seemed to be frozen solid. Where the current ran a little more freely, the ice had been tested at fourteen inches, so that the thousands of skaters passed over the swift flood in perfect safety. The darkness commenced to fall, and the moon grew brighter in the clear sky, while on either bank, lights began to flash in the windows of the cloth-mills along the valley; there was some little work in progress, though even the vale folks were feeling the terrible weather. For ten miles the Swirle Valley was a curious mixture of town and country, rural enough but for the clusters of workmen's cottages, and the smoke from tall chimneys drifting over the cornfields.

Watching the skaters, now fast disappearing in the misty gloom, like jovial demons skimming noiselessly along the frozen stretch, were two countrymen, Swirle Valley-men, as their slow speech and broad keen faces denoted. They were both comfortably clad, and each after the manner of his kind smoked his pipe with the solid grave silence often observed between old friends, when lack of speech does not necessarily mean embarrassment from lack of ideas.

'I mind no such sight as this, and, man and boy, I've worked in Swirle Valley for nigh on fifty year,' remarked the elder at length. 'Fifty-four was pretty hard, but then the ice only bore from Portside Stone Bridge up to the old boat-house. That was half a mile as near as no matter. And when the flood came down, it carried part of the bridge away. A sudden thaw now, with all that snow on the hills, would sweep all the bridges away as if they were made of card-board.'

Jacob Strahan nodded solemnly. All the cottages and the mills whereat Jacob and his companion, Benjamin Attwood, acted as foremen, were situated far above range of any flood, and the notion of disaster for those below was not without a comfortable sense of personal satisfaction.

'I went up last week as far as Maindee,' Strahan replied deliberately; 'and there's ice, ice, nothing but ice, 'ceptin' on the streams, for close on thirty mile. If Portside Stone Bridge should stand the break-up, there'll be a flood along the upper valley such as no man ever see before.'

'Like the one I mind my grandfather speak of in '97,' said Attwood. 'The ice formed a dam at Portside, and the water burst the embankment at Wareham close by Foljambe's mill, and made a new course down the valley. Right behind us it ran in a stream bigger'n the Swirle is now, as you can see by looking behind you at these ruined cottages.'

The speaker indicated the course of the disastrous flood, the memory of which still lives in the Portside district. A few hundred yards above them the Swirle turned suddenly to the right, the bank being strengthened artificially; and below this bank was a broad ravine, running for some miles in the direction of Portside, the roadway from that place to Maindee traversing the gorge half-way up its side. It was a wild and desolate spot, filled with bracken and brambles and large boulder-stones washed up by that terrible flood; while at the head of it stood Foljambe's factory, almost within rifle-shot of the house of the great manufacturer in question. Very few people passed that way at night, since it was a place of evil repute, though Attwood traversed it frequently, as the ravine was a short-cut from the factory to his own house on the other side of the dip.

'We should be safe enough, if anything was to happen,' Strahan remarked with the same comfortable assurance. 'I never liked that valley, Ben, especially this time of year when the snow lies so deep in places. I don't know why I should think so, but I feel main certain that when the frost goes, we shall find your old master somewhere in the ravine.'

'I wish we could find him,' Attwood replied with an impatient sigh. 'He left my house that night just as it was coming on thick, and laughed at me when I warned him against crossing the gorge. When morning came, he was nowhere to be found, and the snow lying twenty feet deep in some places down there. And when he is found, my George's name will be cleared.'

'Let's hope so,' Strahan replied more cheerfully. 'He's a good lad; and though appearances are against him, I firmly believe he'll come out right yet.—And now, unless we're going to stay here all night, it's time to think about a cup of tea. Another hard frost, I see.'

The two old men turned away together, parting finally on the brow of the hill. With the confidence of one who knows his locality, Attwood crossed the ravine, and slowly climbed upwards to the summit, where the cheerful lights shone out from his own comfortable cottage. A weird feeling came upon him as he carefully skirted the great heaps of snow, below one of which, for all he knew, lay the body of his missing employer, Godfrey Foljambe, concerning whose disappearance every Portside individual was still talking, though the mysterious event was five weeks old.

If there was trouble at the great house on the hill, there were equally sore hearts in the foreman's more humble abode. The missing manufacturer was a just and kind employer, with a keen eye for merit; and that keen eye had looked favourably upon young George Attwood, with the result that six years with Foljambe & Co. saw him cashier to the firm. At this time, however, certain strange defalcations had taken

place; there had been a series of investigations, with the result that the younger Attwood had lost his situation. It was a keen blow to employer and employed alike; but the evidence was terribly clear, and the manufacturer had no alternative, though he declined to prosecute.

So things had drifted on till the night before the great snow, when Mr Foljambe had presented himself at Attwood's cottage in a state of great excitement. George was away from home; hearing which, his late employer refused to disclose his business, contenting himself with leaving a message for his quondam cashier to call upon him on urgent business the following morning. It was dark, with a heavy snow falling, as he departed homewards, laughing to scorn the advice tendered by his foreman as to avoiding the treacherous ravine. By morning the snow lay to the depth of three feet; while, in the gorge below, the white wrack had drifted into huge banks and valleys till even the ruined cottages had disappeared. But worst of all, Mr Foljambe was missing. The last person to see him was George Attwood, who, returning home along the road, was cheerfully accosted by his late employer with the information that good news awaited him on the morrow, with which he plunged into the darkness, to be seen no more of men.

'A bitter night,' Attwood cried, as he stamped across the flagged kitchen and warmed his numbed hands at the grateful blaze. 'A night as makes us thankful to know as we've a roof over our heads.—Come, lass, let us have some tea, for I've been standing by the mere till I'm nigh frozen.'

An extremely pretty girl, seated knitting in the ingle nook, rose from her seat and placed a metal teapot on the white tablecloth. Rose Attwood was, after George, the apple of her father's eye—a cottage Venus, clear-eyed and ruddy of complexion, as most of the hands in the valley knew, to the confusion of their peace of mind. But Rose was no coquette; and, moreover, the handsome, taciturn head-clerk at Foljambe's appeared to have monopolised the belle of the district, though, be it said, the course of true love had not hitherto run with the smoothness Rupert Vaughan could have wished.

He rose up from the other side of the fireplace, where he had been contemplating Rose in his usually moody fashion, and joined the party at their evening meal. Latterly, his presence seemed to be an understood thing, though a grim watchful silence, his natural manner, seemed to check all attempts at cheerfulness. Who he was and whence he came were mysteries to the Swirle Valley people, who resented his cool dogged appropriation of the prettiest and most popular of their maidens.

It was a more than usually silent party as George Attwood sat moodily in the most secluded corner, and Vaughan was more watchful and cat-like than usual. Rose, demurely knitting, listened to her father's well-meant attempts at conversation, interpolating a few remarks now and then.

'Heard nothing of Mr Foljambe, I suppose?' He addressed Vaughan. 'I hear that the *Port-side Chronicle* says something about foul-play.'

'Just like those newspaper fellows,' Vaughan

sneered. 'Never mind what lies you invent so long as you sell your papers, is their motto.'

George Attwood looked up with sudden interest, and with far more attention than he had hitherto paid to the desultory conversation. 'I don't know so much about that,' said he. 'The night before Mr Foljambe disappeared, he came here specially to see me. And what did he tell me when I met him afterwards? That he had some good news for me in the morning; and the only good news I could hear was that my name was cleared. Suppose the real culprit had discovered that his crime had come out, and followed my employer across the ravine. He was an old man and feeble. I don't suggest anything, but the task would have been easy.'

'Why not have done it yourself?' Vaughan returned, with a deeper scowl. 'You were the last man, on your own confession, who saw him alive; you met him in a lonely spot; and, for all we know to the contrary, he might have come here that night with fresh proofs against you. Goodness knows, I believe you innocent; but the theory of foul-play is a dangerous one—for you.'

'How rapidly you draw your deductions,' George replied, striving in vain to speak calmly. 'It would be equally sensible to point to you as the murderer. You have the place I held, the place you coveted. Before Smithson went to America, you and he laid your heads together to convict me. By some means or other, Mr Foljambe discovers the truth, and, by some means also, you know that he has done so. Then you follow him, and— Well, the rest is easy. Circumstances soon multiply themselves, suspicion once aroused. Here is one ready made: Why did you miss coming here for the first time in three months on the very night that my late employer had disappeared?'

'This is a poor jest,' Vaughan said hoarsely. 'I did come.'

'Yes, close on eleven o'clock. Still, I do but jest, though you take it so seriously. Still, you insulted me first, and'—

With an authoritative wave of his pipe-stem, Benjamin Attwood put an end to the argument. 'It is a sore subject, and gains nothing by discussion,' he observed sententiously. 'You are both talking nonsense, and dangerous nonsense, too. Change the subject.'

But with this expiring effort, the flickering conversation went out altogether. Vaughan rose, and taking up his hat, wished his friends an early good-night as he passed out, Rose rising to open the door for his departure. In his own masterly way he took her by the shoulder and led her out into the moonlight. 'You will forget all that,' he said fiercely. 'This pain I get at my heart makes me almost mad at times. —Rose, how much longer are you going to keep me waiting?' He bent down as if to kiss her; but the girl drew hastily away. A thin haze crossed the moon, and a puff of wind from the west brushed her cheek. It was as well that she did not see the lurid light in her companion's eyes.

'Very well,' he said. 'Good-night; and remember that the time will come when I shall make you love me.'

Rose felt an almost wild sense of relief as her

impetuous lover disappeared. She did not care for him; her heart told her that, though she shrunk from giving pain by a direct refusal. She lingered a moment in the open, conscious of a milder breath in the air, and listening to the sough of the wind in the woods. Presently, as the clouds seemed to thicken, she felt the rain-spray on her cheeks.

'There is heavy weather on the hills,' Attwood said, as he drew his chair nearer to the wood-fire. 'I thought it seemed warmer.—Bless me, is that rain?' A burst of wind dashed the sheeted water against the casement, and caused the feathery ashes to dance and swirl on the hearthstone. 'A sudden change,' the old man continued. 'There will be no skating on the Swirle to-morrow. A night of rain with all this snow, and before morning we shall see a flood the like of which Portside people have never witnessed before.'

As the cottage lay still and silent, with the heavy downpour roaring on the roof, the groaning and creaking ice on the river rose higher and higher. Morning was still struggling with night as a crash louder than the rest roused Benjamin Attwood, who hastily assumed his clothes, and wrapping himself in a heavy mackintosh, walked towards the river. The vast sheet of ice like a thing of life trembled and vibrated, and then, with a report like the roar of artillery, broke into a million pieces. Suddenly released, the rushing flood-water rose with marvellous speed, creeping up the banks, till within the hour the erstwhile solid plain was a creamy seething mass of green foam and floating ice-floes.

'Eight feet in an hour,' exclaimed Strahan, who had also come out to watch the wonderful sight, 'and thirty miles of ice to come down yet. No chance of that getting through the Portside Stone Bridge. What with the rain in the night and the snow on the Black Mountains, there'll be twenty feet of flood-water, not reckoning the ice at all.'

As the day went on, it seemed probable that Strahan's prophecy would be fulfilled. With alarming rapidity it rose, bearing great fields of ice, until, almost imperceptibly at first, the current began to slacken, while the water itself rose with still more alarming rapidity. The most sinister prophecies had been fulfilled, and the ice had jammed about Portside Bridge.

Along the embankment by Foljambe's factory the immense mass began to collect, pressing in an inclined plane against the bank, over which presently the water commenced to flow into the ravine below. Almost instantly the serried masses moved with irresistible force against the crumbling embankment; and before the astonished eyes of the spectators, it seemed to meet and disappear as, a few moments later, the swollen waters of the Swirle were thundering down the new channel of the ravine.

'Thank Heaven there are no houses there!' Attwood said fervently, his voice utterly drowned in the fearsome din. 'The flood will just waste itself on the broad meadows below Portside without doing much harm. Surely it is a wonderful sight, if a terrible one.'

The sullen waters rolled away, and by the end of three days a few huge boulders and uprooted

trees only remained as evidence of the great flood. The sandy floor of the ravine was firm and hard when Attwood and Strahan, under the direction of Frank Foljambe, commenced to thoroughly search that wave-washed region for the missing manufacturer. The whole face of the gorge was changed; the brambles and bracken had disappeared; while the huge rocky boulders alone remained. The great stones were piled up in fantastic confusion, forming pyramids and caverns into which half-a-dozen men could creep. Vaughan, looking moodily on at the work, seemed uneasy as Strahan turned over the sand under an overhanging rock where some soft substance occupied his attention.

'Why waste your time?' he asked impatiently. 'I tell you there is nothing here.'

Strahan did not reply, as he hurriedly scraped the sand away under the ledge with his spade. There was something yielding there—a scrap of sodden cloth, the toe of a boot, and presently the cold clammy semblance of a human hand came in view. An exclamation of horror and surprise broke from him, hearing which, the rest of the search-party turned to the spot, and carefully assisted the old man in his melancholy task.

The corpse was that of Mr Foljambe, without a doubt. Preserved by the frost and snow, and protected from the violence of the beating waters by the great rock, the body was singularly free from marks of violence, save that there was a livid mark on the neck, and the hands were clenched as if in a convulsion of pain.

'There has been something more than misadventure here,' the dead man's son said with a shuddering respiration. 'And I thought my father was without an enemy in the world.—See, some of you, what is clasped in the right hand, for I dare not look.'

With some difficulty, Attwood opened the stiff fingers, and drew from their clasp a fragment of torn silk. The pattern was dull and faded, but as the searcher laid it on his open palm, he gave a cry of astonishment.

'Great heavens, this is Vaughan's!' he cried. 'He was wearing a scarf of similar pattern when he came to my house on the evening of my poor master's disappearance. It was all pulled-up and disarranged, and Vaughan was always ridiculously neat in his dress. I remember Rose asking him how it happened, and he made some excuse, I forget what.'

All eyes were turned in search of Vaughan, but he had disappeared. There was an ominous silence as the little group bore the body away up to the great house on the hill, where they found the police inspector for the district waiting to hear the result of their search. Another body had been found far down the ravine, and the police had come over for the sake of identification. With a curt gesture of dismissal, the inspector signified that he would be alone with Mr Foljambe, and with a few stern words as to the necessity of perfect silence, the searchers gradually dispersed.

The afternoon wore on slowly, and the factory clock gave out the hour of three before Rupert Vaughan found himself standing in Mr Frank Foljambe's office, confronting that gentleman, who was supported by the police inspector and the two Attwoods. There was, despite the young

employer's marked distress, a stern expression of features, which seemed to paralyse the newcomer's faculties, and to set his heart beating with alarming palpitations.

'I have sent for you,' Foljambe said distinctly, 'on a very painful errand. You are aware perhaps that the body of my unhappy father has been found. That he died by violence there is no possible reason to doubt. We are not without a clue to the murderer, since, in the right hand of the body, we found a fragment of a scarf which has been identified as yours.'

Vaughan suddenly raised his hand to his throat with a choking cry.

'We have discovered in your rooms the missing article to which the torn fragment fits exactly. In my father's pocket-book we have also discovered a letter from America, in the handwriting of your accomplice Smithson, in which he confesses the plot between you, whereby your defalcations and robberies were artfully traced to young Mr Attwood. This information he was probably conveying to the injured young man, who, unfortunately, was not at home, when he met you in the ravine or near it and taxed you with your crime. The letter from America only arrived by the afternoon post, or probably you might have heard of it earlier. We do not ask you to say anything in reply, only I thought it right that you should know of what you are accused.'

'And of what am I accused?' Vaughan asked unsteadily.

'Of the murder of Mr Foljambe on the night of December 28th last,' the inspector put in quietly. 'You will consider yourself my prisoner.'

Vaughan bowed helplessly; he saw no hope in the ring of faces, felt no consciousness save the fluttering pain at his heart. A strange sensation of coming death was strong upon him; he knew too well the terrible consequences to a hopelessly diseased heart likely to arise from the excitement of such a moment. 'I did it,' he said in a faint low voice—'yes, I killed him. I followed him up to Attwood's house, and directly I heard him speak, I knew what he had heard. But I did not care for myself. I might have been beyond arrest before morning, had it not been for my love for that old man's daughter. I am half a Spaniard, and only they know what love means. Blind and mad, I followed my employer. I heard his conversation with George Attwood; and I—I killed him. I strangled him in the ravine, and hid the body under a great flat stone, piling others upon it till the snow drove me away. I dared not keep away from Attwood's, though I had forgotten my torn scarf, which has betrayed me. I did not intend to wrong George here; but we—Smithson and I—had been speculating, and some one had to suffer. —Bah! you are wondering why I am so foolish as to make such a full confession. I know, because'— He paused, as a horrible pain, keen as a knife, shot through his heart. Presently, with white ashy face and pallid lips, he continued painfully: 'I am not afraid. I shall never leave this room alive. I have been solemnly warned against any sudden shock, and this has overpowered me. I killed Foljambe; ay, I would have killed him twenty times, and suffered all the agony I have gone through a

hundred times, rather than lose the love on which I had set my life. And when you think you have me in your grasp I cheat you—thus.' With a gesture of despair and defiance, he threw up his hands, falling prostrate upon the floor with a resounding crash.

Forgetful of his wrongs, Benjamin Attwood raised the motionless form, so still and silent. 'He has fainted,' he said. 'The excitement has been too much.'

'He is dead,' said the inspector solemnly, as he laid his hand upon the pulseless wrist. 'The prisoner has gone before a higher tribunal than ours.'

There is a new partner in the house of Foljambe & Co. now, whose name is Attwood; and a new resident in the great house on the hill, whose name is Rose. Society and her equals were disposed at first to envy the social promotion of the valley beauty; but as she bears her honours so meekly and sweetly, the sore feeling is rapidly subsiding. But however long they remain there, four actors in the drama are never likely to forget the great flood and its dramatic sequel. For had it not been so ordained, the secret of Godfrey Foljambe's disappearance might have remained a mystery to the end of time.

THE MAY QUEEN.

THE boughs were white with the bloom of May,
And the wild bees were astir,
And fitting about the livelong day
In their vests of golden fur,
And the swallows were circling far above
The meadows fresh and green,
When I ventured first to tell my love
To a blushing, fair, young queen.

And never a royal dame, I'd say,
Had a crown one-half so fair
As the flowery wreath that lightly lay
On her wealth of golden hair.
And her cheeks were red as a rose in June,
And her radiant, smiling eyes
Had the hue we see some summer noon
In the far, blue, gleaming skies.

And the linnet's notes with the woodlark's rang,
And the blackbirds answered keen,
And the village lads and lasses sang
As they danced around their queen;
And I joined their sports and shared their fun
The length of that summer day
Round the tall May-pole, and wooed and won
The maid that was queen of May.

I know that her hair is silvered now
By many a winter's snow,
There are lines of care on her once smooth brow,
And her cheeks have lost their glow;
But to me she is still as fair and young
As she was that summer day
When I told my love with faltering tongue
To the maid that was queen of May.

ON WEALTH.

ALL men, it has been said, desire Wealth except those who have possessed it long enough to know that it, too, is vanity and vexation of spirit. In like manner, all men dread poverty except those who have endured it long enough to know that the fear of it is far worse than the reality. One of the negative advantages of wealth is this lifting up of a man above the dread of being in want, or in debt, or being neglected and insignificant, or even of having to work. For to the aged and sickly this last is a terror. To be rid of the fear of these calamities is no small gain. To have no dread of being deserted in old age, when the face is no longer fair to look upon, when the sight is dim, the hearing dull, the breath acrid, the temper, it may be, irritable—to feel secure of honour, love, obedience, or what pass for such, is one of the prerogatives of riches. In sickness, to have all duteous cares and attentions redoubled about them, is another; for the hand, feeble though it be, is yet a hand of power; and the breath, shortened and labouring, still carries authority to control the destinies of those about them. True it is, nevertheless, that whoso hath riches hath fear—fear of the proverbial wings which riches make to themselves and fly away with; fear, too, of leaving them—for he remembers having read at his mother's knee how that 'the rich man shall lie down, but he shall not be gathered: he openeth his eyes, and he is not.' Above all, the rich man nourishes that form of fear which shows itself as distrust and suspicion—distrust of the advances of strangers, suspicion of the motives which dictate those advances.

There is, without doubt, a hollowness in the deference with which the owner of great wealth is often approached on the one hand, and on the other a well-grounded suspicion of that hollowness, which hampers the intercourse between the wealthy and those about them. This applies not so much to the young rich man, who, well satisfied with himself and his surroundings, is seldom prone to suspicion, and is therefore an easy dupe

to flatterers; but to him whose distrust of his fellows is justified, as he considers, by the experience of a lifetime passed amongst toadeaters and sycophants.

The serene pleasure produced by perfect freedom in intercourse is thus inevitably absent, since that freedom is incompatible with a suspicion of insincerity. Inequality of fortune is alone sufficient to put this freedom into bondage. Men like Swift, who have actually felt their inferiority of position coupled with superiority of understanding, are apt to vent the irritation thus engendered in bitter sarcasm—a sarcasm which plainly reveals how their self-respect has been galled by the sight of the deference due to worth, absorbed by wealth.

But if it be painful to an upright mind to see money-grubbers respected, or to be themselves suspected of interested motives when paying due deference to the aged rich, how much more painful is that experience which teaches distrust of the frank advance, the courteous accost? What an inward degradation and stab to self-respect, to be compelled involuntarily to weigh the motives of those who address us, and question if it is to ourselves the courtesy is due, or to the power temporarily vested in our hands! Under this strain, many a naturally sweet and generous mind has turned morbidly sour and suspicious; while more than one great mind has deliberately resigned those adjuncts which it knew to be less than itself, but which it also knew to be the objects of worship and envy to those by whom it was surrounded.

Among the positive advantages of riches may be reckoned their efficacy to introduce their owner not only into society which his attainments alone could not command, but also that they give him the power of becoming acquainted with the grandest scenery of earth, by enabling him to travel; that they leave him leisure to study, should he be so disposed, the latest marvels of science, the most exquisite productions of art; to follow the glorious imaginings of poets, and learn wisdom of the philosophers.

But wealth has greater riches in store even than these, great as they are. It gives a man power to benefit his fellow-men. A rich man can, if he be so minded, be eyes to the blind, feet to the lame, health to the sick, comfort to the care-laden. By a scrape of his pen he can turn the children of the poor man from burdens into blessings, by putting them in a position to earn their own livelihood, and perhaps help their parents. To the ignorant he can give instruction; to the unemployed, work; to the worker, encouragement; to the unsuccessful, consolation; to the despairing, hope.

Who, then, shall say that wealth is not to be desired—that it is wrong to covet riches? No one, except perhaps the man who, secretly coveting, despairs of attaining, and affects to despise wealth. One among the many curious effects of riches on the minds of men, is the growth of the capacity and desire for all that wealth can bestow, which usually accompanies the accumulation of riches. 'If riches increase, how are they increased that eat them,' is as true to-day as it was two thousand years ago. People are said to rise with their circumstances when everything they can now legitimately enjoy is to them as though it had always been theirs; who, driving in a carriage, forget they have ever walked; or, drinking wine, forget their toast-and-water days; or, more rarely, dressing richly, are oblivious of the change in their attire. A bride may forget her ornaments, but can a newly-rich woman be unmindful of her diamond ring? And when, after twenty years of creating, and twenty years of enjoying wealth, when you are getting to feel 'the old man,' and the young folks are beginning, gently and indulgently, but persistently, to come to the front, invite the company, decide the time and place of the annual holiday, when, suddenly, those Silverine bonds fall lower and lower, and the Grand Cerulean shares drop like mercury before a storm—when, in short, riches make themselves wings and fly away—when Bob is taken from college and sent 'abroad;' and Julia's harp is sold, and Julia herself, the pride of your heart, becomes governess to the children of your dearest enemy; and your wife, prematurely aged, sits opposite to you by the fireside, looking at the hands unadorned now by diamonds, and weary with unaccustomed work: when this comes about, why, then, for the first time you realise what is meant by the 'deceitfulness' of riches.

But if riches do not fly away, but steadily increase, some there are in such a case who by-and-by lose the power to make use of their wealth. They may have a fine house; they barely allow themselves the use of the worst room in it; they walk, with the means of riding in their cash-box; they deny themselves all pleasures to indulge in the one pleasure of saving. In their waning age, honour and ease are as nothing beside the accumulation of barren metal, which, like a load, they carry until death relieves them of the burden.

Too often is it true that though 'the rich man answereth roughly,' he is never without friends, especially if he be childless—friends who attend upon his whims and fancies for the sake of that which he will never part with until it is no longer his to give or to withhold; and he earns

the posthumous gratitude of his legatees, a gratitude vastly increased by the fact that there is no need to give it expression. For they say, and not unjustly: 'Poor man! he held tight to it as long as he could. If he could have kept it, it wouldn't be mine now. Small need of thanks.'

The very look of money, coined or in the potential note or draft, is irresistible to some minds. We all remember the story of the young man who, going to repay his uncle the loan of a thousand pounds, was received with assurances of the unimportance of the affair, and the very slight necessity there was for repayment, or even thinking any more about it, until the nephew produced a crisp, new thousand-pound note, which so fascinated the eyes and imagination of the lender, that after fingering, he finally pocketed the note, saying: 'Ah, well; you can come again, you know, if you are hard up at any time;' leaving the disappointed prodigal firmly convinced that had the note been an old and a dirty one, or the sum made up of coinage and paper—in short, had it been anything but what it was, clean, crackling, crisp, *multum in parvo*, his kinsman's generosity would have got the better of his cupidity, and he himself have been the richer by a thousand pounds.

Of all the causes of quarrel public and private since the world began, wealth 'treasure' is surely the most certain and most prolific. The emulation of intellects is keen all the world over, but it is mild compared with the struggle for riches between nations and individuals. And if it be true, as it is, that 'there is that maketh himself rich and yet hath nothing'—who, having all that wealth can bestow, is yet a pauper in heart and brain, living a life of fear and suspicion—fear to lose his treasure, suspicion of the motives of those about him, still, this man is not so sunk as the man who envies him his hoarded wealth. If fear be the curse of the rich, envy, cankering envy, is no less the curse of the poor. Burns says:

It's hardly in a body's power
To keep, at times, frae being sour,
To see how things are shared;

and if he, the large-hearted, strong-brained poor man, felt this, how certainly is it experienced by the narrow soul, who thinks that because money would make *him*, as he fancies, happy, so the rich must be happy also; and he envies them accordingly. Yet, would he consider for a moment, his envy would soon abate: the rich man is but the steward of his wealth; only a certain limited amount can he spend upon himself, and he often toils in his stewardship more strenuously, and with less appreciation, than his salaried dependents. Add to this the fact—of which the wealthy are often painfully conscious—that the very persons whose friendship would be most acceptable to them are those who purposely avoid them, for fear of misconstruction; that the woman they love turns away because she will not submit to be suspected of marrying for money; and so they are left to the society of less sensitive, or more candidly interested companions, who both foster and justify their distrust; and it will be acknowledged that the 'wine of life'—happy, unrestrained intercourse

with their fellows—is to a great extent denied to the lonely rich man.

But this negative disadvantage pales its ineffectual fires before the active persecution which besets the wealthy. Now and then the curtain is lifted, and we see the millionaire a prey to nervous fears, a revolver by his bedside, in dread that some one of the maniacs who daily dog his path, and deluge his letter-box with impossible demands for his cash, may attempt the vengeance they all threaten. If he cannot hope to be loved for himself, is he also to be deprived of all peace of mind and sense of security? Will men never approach him except with hands extended either to beg or to menace?

'Ah, Davy,' said Dr Johnson, after surveying Garrick's grand new house, furnished with all that was pleasant to the eye and good for comfort—'ah, Davy, these are the things that make death terrible!'

Certain it is that if to leave aches and pains, penury and anxiety, distress and want, and neglect and unkindness, to exchange these for what they hope of heaven, makes death a not unwelcome visitor to half the human race; so, to leave ease and plenty, comfort and happiness, warmth and friends, love and life itself—to exchange these for what they fear of the chill, unknown hereafter—makes the importunate Phantom appear to the other half, in Eastern guise, as the Separator of companions, the Divider of friends, the Finisher of delights, and the Replenisher of tombs. So that, as wealth is not without its drawbacks and disadvantages, as it engenders fear, distrust, suspicion, envy, hatred, and disagreements without number, it is well to remember that either riches or poverty is but in opinion, that that man is rich whose wants are few, and that all have riches sufficient who have enough to be charitable.

THE IVORY GATE.*

By WALTER BESANT.

CHAPTER XVIII.—WAS HE IN RAGS?

STUBBORN as a mule. Yes—it is the way with some girls: man is soft as wax compared with woman: man concedes, compromises, gives way, submits: woman has her own way—when that way is the right way she becomes a pearl above price.

Elsie, when the door was shut and her sister gone, stood silent, immovable. A red spot burned in her cheeks: her eyes were unnaturally bright: her lips parted: she was possessed by a mighty wrath and great determination: she was the tigress who fights for her beloved. Meantime, everything was changed: the sunshine had gone out of the day: the warmth out of the air: her work, that had pleased her so much an hour ago, seemed a poor weak thing: not worth thinking about. Everything was a trifle not worth thinking about—the details of her wedding: her presents: her honeymoon: her pretty flat—all became insignificant compared with this threatened charge against her lover. How was it to be

met? If it was only a suspicion put into shape by Sir Samuel and old Checkley, it would be best to say nothing. If it was really going to be brought against him, would it not be best to warn him beforehand? And about her brother?—

She sat down and wrote out the facts. To be doing this cleared her brain, and seemed like working for her lover. In March 1882 a cheque for £720 to the order of one Edmund Gray was cashed in ten-pound notes by a commissionaire sent from an hotel in Arundel Street, Strand. No one ever found out this Edmund Gray. Athelstan was suspected. The notes themselves were never presented, and were found the other day in Mr Dering's safe, covered with dust, at the back of some books.

In February, March, and April, by means of forged letters, a great quantity of shares were transferred from the name of Edward Dering to that of Edmund Gray. The writing of the letters was the same as that of the forged cheque.

These were the only facts. The rest was all inference and presumption. Athelstan had been seen in London: Athelstan had been living all the time in London: Athelstan had been seen going into the house which was given as the residence of Edmund Gray. Well—Athelstan must be seen the very first thing. Further than this point she could not get. She rang the bell, ordered tea to be brought to her own room, and then put on her hat and went out to the Gardens, where she walked about under the trees, disquieted and unhappy. If a charge is going to be brought against you, the most innocent man in the world must be disquieted until he knows the nature of the evidence against him. Once satisfied as to that, he may be happy again. What evidence could they bring against George?

She went home about eight, going without dinner rather than sit down with her mother. It is a miserable thing for a girl to be full of hardness against her mother. Elsie already had had experience, as you have seen. For the present, better not to meet at all. Therefore she did not go home for dinner, but took a bun and a cup of coffee—woman's substitute for dinner—at a confectioner's.

When George called about nine o'clock, he was taken into the studio, where he found Elsie with the traces of tears in her eyes.

'Why, Elsie,' he cried, 'what is the matter? Why are you crying, my dear? and why are you alone in this room?'

'I choke in this house, George. Take me out of it—take me away. Let us walk about the Squares and talk. I have a good deal to say.'

'Now, dear, what is it?'—when they were outside. 'What happened? You are trembling—you have been shaken. Tell me, dear.'

'I don't think I can tell you just at present—not all.'

'Something, then—the rest afterwards. Tell me by instalments.'

'You are quite happy, George? Nobody has said anything to make you angry, at the office, or anywhere else?'

'Nobody. We are going on just the same. Mr Dering thinks and talks about nothing but the

* Copyright 1892 in the United States of America by Harper & Brothers.

robbery. So do I. So does everybody else. I suppose Checkley has told, for every clerk in the place knows about it, and is talking about it.—Why do you ask if anybody has made me angry?

'My dear George, Hilda has been here this afternoon. You know that—sometimes—Hilda does not always say the kindest things about people.'

'Not always. I remember when she wrote me a letter asking whether I thought that a lawyer's clerk was a fit aspirant for the hand of her sister. Not always just the kindest things. But I thought we were all on the most affectionate terms, and that everything had been sponged out. She has been saying more kind things about me. What have I done now? Isn't the money difficulty solved?'

'I will tell you some other time—not now—what she said. At the present moment I want to ask you a question. If you have reasons for not answering, say so, and I shall be quite satisfied; but answer me if you can. This is the question. Hilda says that Athelstan is secretly in London, and that you know it, and that you have been seen with him. Is that true?'

'Well—Elsie—the only reason for not telling you that Athelstan is here is that he himself made me promise not to tell you. Athelstan is in London. I see him often. I shall see him this evening after leaving you. He is in London, walking about openly. Why not? I know no reason for any concealment. But he cannot go to see his mother, or enter his mother's house, until this charge against him has been acknowledged to be baseless. As for you, he will be the first person to visit you—and will be your most frequent visitor—when we are married. He is always talking about you. He is longing for the time when he can see you openly. But nothing will persuade him to come here. He is still bitter against his mother and against Hilda.'

Elsie sighed. 'It is very terrible—and now — But go on.'

'I have answered your question, Elsie.'

'Oh, no. I have only just begun. You say that Athelstan is in London; but you do not tell me what he is doing and how he fares.'

'He fares very well, and he is prosperous.'

'Hilda says that he has been living in some wretched quarter of London all these years; that he has been frequenting low company; and that he has been, until the last few weeks, in rags and penniless.'

George laughed aloud. 'Where on earth did Hilda get this precious information? Athelstan in a low quarter? Athelstan a Prodigal? Athelstan in rags? My dearest Elsie, if Lady Dering were not your sister, I should say that she had gone mad with venomous hatred of the brother whom she made so much haste to believe guilty.'

'Oh! Tell me quick, George. Don't say anything against Hilda, please. I am already— Tell me quick the whole truth.'

'Well, dear, the whole truth is this. Athelstan is doing very well. I suppose you might call him prosperous. When he went away, he had ten pounds to begin with. People kindly credited him with the nice little sum of £720 obtained by

a forgery. We now know that this money has been lying in the safe all the time—how it got there, the Lord knows—perhaps Checkley could tell. He went to America by the cheapest way possible. He had many adventures and many ups and downs, all of which he will tell you before long. Once he had great good fortune on a silver mine or something: he made thousands of pounds over it. Then he lost all his money—dropped it down a sink or into an open drain—you know, in America, these traps are plentiful, and started again on his ten pounds. He was a journalist all the time, and he is a journalist still. He is now over here as the London correspondent of a great paper of San Francisco.—That, my dear Elsie, is, briefly, the record of your brother since he went away.'

'Oh! But are you quite sure, George?—quite—quite sure? Because, if this can be proved'—

'Nothing is more easy to prove. He brought letters to a London Bank introducing him as the correspondent, and empowering him to draw certain moneys.'

'How long has Athelstan been at home?' She remembered the dates of the recent forgeries, and the alleged fact that all were in the same handwriting.

'You are so persistent, Elsie, that I am certain you have got something serious on your mind—won't you tell me?'

'No, George—not to-night. But—how long has Athelstan been in England?'

'I will tell you exactly how and when I met him. Do you remember three weeks ago, that Sunday evening when we were so happy and so miserable—resolved on braving everything—going to live on love and a crust for the rest of our lives?—you poor, dear, brave girl!' He touched her fingers. 'I shall always be thankful for that prospect of poverty, because it revealed my mistress to me in all her loveliness of love and trust and courage.'

'Oh, George—you spoil me. But then I know myself better.'

'Well—on that evening we went to Church together; and after Church, as I was not allowed in the house, we walked round and round the Square until the rain came on, and we had to go home. Well, you did not take any notice; but as you stood on the steps waiting for the door to be opened, a man was standing on the kerb under the lamp close by. When the door was shut behind you, I turned and walked away. This man followed me and clapped me on the shoulder. It was Athelstan.'

'And I saw him and did not know him!'

'He has grown a big beard now, and wore a felt hat. He is a picturesque object to look at. Ought to have been one of Drake's men. I dare say he was in a former existence. He had then been in England exactly a week, and every day he had prowled about the place in the hope of seeing you—not speaking to you—he trusted that you would not know him again.'

'Oh, poor Athelstan! That is nearly three weeks ago. He has been in England four weeks—a month—and three—four—five months ago—where was he?'

'I told you. In California.'

'Oh! Then he could not—possibly—not pos-

sibly—and it can be proved—and oh! George—George—I am so glad—I am so glad.' She showed her joy by a light shower of tears.

'Why, my dear,' he said, soothing her, 'why are you so troubled and yet so glad?'

'You don't quite understand, George. You don't know the things that are said. All these forgeries are in the same handwriting.'

'Certainly.'

'One man has written all these letters and cheques and things—both that of eight years ago and those of last March?'

'That is perfectly certain.'

'Then, don't you see? Athelstan was out of England when these newly-discovered forgeries were done. Therefore, he had no hand in them. Therefore, again, he could have no hand in the earlier one. Why—you establish his innocence perfectly. Now you see one of the reasons why I was so glad.'

The other reason—that this fact destroyed at one blow the whole of the splendid edifice constructed upon the alleged stay of Athelstan in London—Elsie concealed. Her heart, it must be acknowledged, was lightened. You may have the most complete belief in the innocence of a person, but it is well to have the belief strengthened by facts.

'As for me,' said George, 'I have been so long accustomed to regard him as one of the worst used of men, that I never thought of that conclusion. Of course, if the handwriting is the same, and it certainly seems the same—a very good imitation of Mr Dering's hand—there is nothing now to be said. Athelstan was in California in the spring. That settles it. And the notes were in the safe. Two clinchers. But to some minds a suspicion is a charge, and a charge is a fact.'

'George, you must take me to Athelstan. Give me his address.'

'He is in lodgings in Half-moon Street. I will ask him if he will meet you.'

'No—no; let me go to him. It is more fitting. You will see him presently. Will you tell him that I will call upon him to-morrow morning at eleven? And tell him, George, that something has happened—something that makes it impossible for me to remain at home—even for the short time before our wedding.'

'Elsie! this is very serious.'

'Yes, it is very serious. Tell him that I shall ask him to receive me until the wedding, or until certain things have happened.—But in any case—oh! they must happen so—they must—it is too absurd.'

'Elsie, my dear, you grow interjectional.'

'Yes—yes. I mean, George, that if things turn out as I hope they may, I will go home again. If not, we will be married from Athelstan's lodgings.'

'And you will not tell me what this terrible business is?'

'Not to-night, George,' she repeated. 'It is very serious, and it makes me very unhappy that my mother and sister'—

'It was something to do with me, Elsie, clearly. Never mind. Tell me when you please. Whatever you do is sure to be right. I will see him this evening.'

'Thank you, George. I think that what I

propose is the wisest thing to do. Besides, I want to be with you and Athelstan. Tell him that as he left the house eight years ago, I leave it now.'

'You? Why, my dear child, what forgeries have you been committing?'

'None. And yet— Well, George, that is enough about me and my troubles. Tell me now about your search into this business. How have you got on?'

'There is nothing new to report. I told you that I left a note on Edmund Gray's table. No answer has come to that. The Bank has written to tell him that his letter of introduction was a forgery. No answer. The dividends are accumulating: he draws no cheques: he makes no sign. In a word, though this money is lying to his credit, and the shares are transferred to his name, and the letters give his address, there is nothing whatever to convict the man himself. We could not prove his signature, and he has taken none of the money. He might call any day and say that he knew nothing about it. I wonder he hasn't done it. When he does, we shall just have to put everything straight again. As for poor old Checkley, I really believe that he is going mad. If I meet him, he glares: if he is in his master's room, his eyes follow me about under his shaggy eyebrows with a malignity which I have never seen painted. As for being described, words couldn't do it. I suppose he sees that the end is inevitable. Really, Elsie, the man would murder me if he dared.'

'The man is dangerous, George, as well as malignant. But I think he will do you no harm in the long run.—Have you told Athelstan what is going on?'

'Certainly. He follows the business with the greatest interest. He agrees with me that the thing is done out of the office with the help of some one in. Now, the point is, that the man in the office must have the control of the post. All the letters must pass through his hands. Who is that man? No one but Checkley. Everything turns on that. Now, here is a lucky accident. An old friend of Athelstan's, a man who coaches, has chambers on the same stairs and on the same floor. He knows this Mr Edmund Gray. We have been to his rooms to question him.'

'Is it to see this old friend that Athelstan visits No. 22?'

'Yes. His name is Carstone—commonly called Freddy Carstone—a pleasing man, with a little weakness, which seems to endear him to his friends.'

'This is the way in which things get distorted in a malignant mind! Well. What did this gentleman tell you about this mysterious Edmund Gray?'

'Nothing definite. That he is some kind of Socialist we knew before: that he has occupied the chambers for ten years or so we knew before. Also, that he is an elderly gentleman of benevolent aspect. And that he is irregular in his visits to his chambers. We seem to get no further. We see Checkley coming out of the house. That connects him, to be sure. But that is not much. There is no connection established between Edmund Gray and the forgeries in his name. Nor between Checkley and the forgeries.

One feels that if one could lay hold of this mysterious elderly gentleman, a real step in advance would be taken.'

'You talked at first of arresting him on the charge.'

'Well—there is no evidence. His name has been used—that is all. On that evidence, no magistrate would issue a warrant. Sometimes one's head goes round with the bewilderment of it. I've managed to learn something about Checkley in the course of these inquiries. He is quite a great man, Elsie: a tavern oracle in the evening: a landlord and householder and collector of his own rents at odd hours: a capitalist and a miser. But he is not, as thought at first—Edmund Gray.'

They had by this time got round to the house again. 'Go, now, George,' said Elsie. 'See Athelstan this evening. Tell him that I must go to him. I will tell him why to-morrow.'

'If he is not at his club, I will go to his lodgings. If he is not there, I will wait till he comes home. And before I go home, I will drop a note for you.—Good-night, sweetheart—good-night.'

THE NEW CANADIAN CENSUS.

THE recent census of Canada is interesting for many reasons, apart from the rather disappointing increase (504,601) it shows in the population, equal to about 11·66 per cent. in the decade 1881-1891. The figures for the various Provinces, as compared with those of 1881, are as follows: Nova Scotia has a population of 450,523, as against 440,572 in 1881; New Brunswick, 321,294, as against 321,233; Prince Edward Island, 109,088, as against 108,891; Quebec, 1,488,586, as against 1,359,027; Ontario, 2,112,989, as against 1,926,922; Manitoba, 154,442, as against 62,260; British Columbia, 92,767, as against 49,459; and the North-west Provinces and Unorganised Territory, 99,722, as against 56,446. In the Maritime Provinces the gain is 1·17 per cent.; in Quebec, 9·53 per cent.; in Ontario, 9·65; in Manitoba, 148·06; in the North-west, 164·76; in British Columbia, 87·86; and in the Unorganised Territory, 80 per cent.

Among other things the census indicates that in new countries, as in older ones, there is apt to be a falling-off in the rural population and a movement towards the towns. This in the case of the Dominion of course only applies to the older provinces, not to Manitoba, the North-west Territories, and British Columbia; and it is accounted for by reasons somewhat different from those which generally obtain elsewhere. There are naturally some points of similarity, such as the development of the manufacturing industries, which has been specially noticeable in the last ten years; the higher wages in the towns; and the lessened demand for labour caused by the improvements in agricultural machinery. But, on the other hand, there are no heavy rents and taxes or tithes, and there is not so wide a divergence between urban and rural wages as in Great Britain. The slowness of the increase is all the more remarkable in view of the immense areas of unoccupied land still to be found in the

older provinces, except Prince Edward Island. Most of the Crown land in question is, however, covered with bush, scrub, or forest; and no one who has not had a hand in clearing a farm under such conditions, or who has not seen the process in course of development, can form any idea of what the work means. The farmers, although usually comfortably off, and able to make a good living on the old homesteads, are not always able to buy improved farms for their sons as they grow up; and consequently, the latter, instead of taking up claims in the backwoods, as their fathers did, go West to the free-grant lands on the prairies of Manitoba and the North-west Territories, or else make their way into the towns. Then, again, the old folks in such cases often sell the farms they hewed out of the forest in years gone by, and go West with their sons, the proceeds of the sale being sufficient to start the whole family comfortably on a comparatively large tract of land there. This helps to explain the slow progress of the rural districts of the older parts of Canada, and, in conjunction with the immigration that has taken place, the more rapid increase in the prairie country and in British Columbia. The forest lands of Nova Scotia, New Brunswick, Quebec, and Ontario will undoubtedly be attacked in time; but we shall have to wait until land becomes scarcer than it is in the great western plains of the Dominion. The condition of things in those provinces is not singular, for the same causes have been at work in New England, and there has been a falling-off in the population of the rural districts of that part of the United States.

The movement to which reference has been made is merely a transference of population from the east to the west, and is of recent growth. But before the great Canadian plains between Winnipeg and the Rocky Mountains were opened up and made accessible, which only took place in a partial degree about ten years ago—the Canadian Pacific Railway was not completed until November 1885—a goodly proportion of this bone and muscle of Canada went to the prairies of the United States, which have been available for settlement for the last thirty or forty years. The large number of Canadians in the Republic is the result of that emigration, and the lamentable consequence of British apathy in allowing the millions of acres of fertile land within our own boundaries, north of the forty-ninth parallel, to remain a *terra incognita* for so long a period. There is another thing which helps to explain the existence of a strong Canadian element in the States. Before the extension of the limits of the Dominion by the acquisition of the Hudson Bay Territory and British Columbia, Canada consisted of a strip of land along the great lakes, the river St Lawrence, and the coasts and rivers of Nova Scotia, New Brunswick, and Prince Edward Island. It was practically without railway communication to any large extent, and the area under cultivation did not increase with much rapidity from the time the American prairies began to attract attention. All this time, however, the rising generation in many well-to-do middle-class and successful agriculturists' families were being educated for the professional and lighter callings; and as Canada did not then supply so many openings of the kind as she does now, and the

manufacturing industry was in its infancy, these young people were almost obliged to go to the States; and the same thing may be said of the youthful French-Canadians and others, who were attracted by the high wages of the New England factories. There is little or no movement from Canada to the United States at the present time; indeed, so far from its being the case, people are going to Canada from the United States; and over three thousand emigrants from Dakota are reported to have settled in Manitoba and the North-west Territories last summer.

The increase in these last-named provinces and in British Columbia, though more satisfactory than in Eastern Canada, is not what was expected; but it must be remembered that twenty years ago the country was, as Lord Beaconsfield described it, an illimitable wilderness, having no railway communication with Eastern Canada; in fact, there was not a mile of railway in the country. As already mentioned, it is only six years since the Canadian Pacific Railway was completed. The population, chiefly Indians, was in 1878 under forty-four thousand; in 1881 it had increased to about eighty-eight thousand; and in 1891 it was about two hundred and twenty-one thousand, which, in view of all the circumstances, is not a bad showing. Immigration has to be coaxed and attracted; and much as more people are wanted there, they cannot be forced to go, and the movement must develop naturally. Manitoba has had to contend with misrepresentations of all sorts, and other things have tended to prevent a rush of immigrants, not the least being the competition of countries that have been open longer for settlement. A large population always acts as a magnet so far as immigration is concerned. But its day is coming very rapidly, and the recent visit of the British Tenant Farmers, their favourable reports, and the splendid harvest of last year, will do much to draw attention to the great advantages of Manitoba and the North-west.

Much publicity has been given to the statement that the yearly Reports of the Department of Agriculture show that over eight hundred thousand immigrants landed in the Dominion during the last decade; and as the total increase in the population is only a little over five hundred thousand, it is claimed that there is a screw loose somewhere. But there is little doubt that the immigration returns are inaccurate. The British Board of Trade Emigration returns, so far as regards British North America, show an emigration to Canada less than a third of that claimed in the Canadian returns. It is true that they do not include those who go to Canada by way of American ports, a considerable number nowadays, but not sufficient to account for a half of the balance. They include all the steerage passengers as well as actual emigrants, and for that reason are not reliable; the Canadian returns are also of doubtful utility for much the same reason, as there is a large amount of travel on business and pleasure between Canada and the United States. It deserves to be mentioned that there is a widespread feeling in Canada that the census returns are not so accurate as they might be; and it is admitted that the plan of enumeration adopted this year excluded many thousands of persons who would have been included if that in use in 1881 had

been continued. In many places local recounts are threatened, and one or two that have recently taken place seem to indicate that there is some ground for the distrust that exists. The population of Victoria, British Columbia, for instance, according to the official census, was only 16,841, while a later civic recount places the total at 24,972. There is also a divergence between the official and municipal censuses in Toronto and Vancouver. Again, the birth-rate in Canada has diminished in the last twenty years or so; and in Ontario alone it is said that had the size of the average family been maintained at its former percentage, the population this year would have been higher by nearly two hundred thousand!

It is not likely that Canada will get two hundred and fifty thousand people a year in the North-west, as an enthusiastic Governor once prophesied, at anyrate for a long time; but now that the Confederation is practically complete, all the provinces being united by railway, possessing ample means of local communication, and having access to the Atlantic and Pacific Oceans, there is no doubt whatever that Canada generally, and especially the Western country, is upon the threshold of a period of active development. General statistics show that the material progress of Canada and its 4,829,411 inhabitants will compare favourably with any other country in which similar conditions prevail, either inside or outside the British Empire; and it will be strange indeed if the next census does not tell a much more satisfactory story than that of 1891.

MAJOR RANDALL'S WARNING.

PART II.

MR DREW was the manager of Merstoke Bank, residing over its offices in the High Street of that small cathedral town. On the morning of the day on which this story opened, he was hurrying over his breakfast in order to get away from the repinings of a discontented wife, who was upbraiding him for being a man with 'no ambition.'

'We ought to take a higher position,' said Mrs Drew.

'Let us be contented as we are, my dear; I am happy in my own station of life,' answered he.

'You don't push.'

'Certainly not to be thrust back again.'

'But you must confess that we are passed over. Lady Compton did not invite us to her garden fête; yet the Fullers were there, and he's only doctor, and as poor as a church mouse.'

'He cured her bad leg, my dear.'

'If you please, it was the servants he attended. One day, hearing she had rheumatics in her knee, he recommended camphorated oil; that's all he did.'

'At anyrate she walks now quite as well as you do, and declares that he cured her.—You have little to complain of, Martha. I am sure that very nice people invite us. We dined last week at the Sub-dean's in the precincts.'

'Bother the Sub-dean! He was only a tutor at Cambridge, and married a governess—and there was nobody of any consequence asked to meet us—only old lawyer Frampton, his deaf wife,

and the new organist at the cathedral; while a few days afterwards they gave another dinner-party with the Dean and Lady Charlotte, and two K.C.B.s!

'In small parties, my dear, people should only be brought together of nearly the same social position,' replied the bank manager, very sensibly.

'I consider myself as much a lady as the Dean's wife—as good as any in the county, and better than most in this town,' replied Mrs Drew, reddening with anger. 'No; it's as I've always said, you don't make enough of yourself; you've no ambition!'

Mr Drew looked at his watch, bolted his toast, drank his remaining coffee, and hurried away. He stopped at the door, however, to fire a parting shot. 'It is not what we consider ourselves, Martha; it is what we are in other people's opinion.' Then he fled. Mrs Drew shed a few angry tears, and set herself to consider how she could alter the existing state of things.

It is a remarkable circumstance frequently occurring, that when people are happy and prosperous, without a serious care in the world, they invent a grievance; and this silly woman was discontented because she could not enter the society to which neither her birth nor her education entitled her.

'A benevolent purpose would be a good way of getting in with them—a fancy bazaar for a charity, if the Mayor would lend the town hall,' she soliloquised. 'When they know me, and what a superior lady-like person I really am, they would cultivate my acquaintance.' This and similar thoughts occupied Mrs Drew's vacant mind that morning for some time, when there was a ring at the house-bell, and a visitor was announced.

Her face grew black, and the frown on her brow reappeared as she heard the name. It was a visitor who seldom called more than once in six months, and was not ushered into her drawing-room—a choice apartment overcrowded with showy furniture—but into a parlour opening from the hall.

This visitor was an old man, tall, thin, who had been handsome in earlier life, with well-cut features, a fair pale face, and light gray eyes. He was dressed in a drab-coloured suit of homespun, and wore leather leggings, as is the fashion of country people. He was Isaac Twyford, the miller at Roby, a small village at some ten miles' distance. His face brightened into a smile when Mrs Drew sailed into the room; he advanced to meet her, putting out his hand, in which she condescendingly placed the tips of her fingers.

'Well, Martha,' said he, 'as usual you do not seem to be pleased at seeing me. Your worthy husband is always friendly; one would suppose that he was my relation, instead of you.'

'What is it you expect, uncle? People cannot always go on in the same groove. I have been married sixteen years, and quite stepped out of my early sphere. I'm sure I'm always civil to you,' replied Mrs Drew with a sigh.

'You are pretty well so, perhaps; but there seems no real warmth in you, for I am a lone man, and you are a blood-relation—my nearest kin; I have felt a void since—since' (here his voice faltered and grew husky), 'since Elizabeth left her old father.'

'Don't mention her name in my presence!' cried Mrs Drew, holding up her hands in abhorrence. 'She's not fit to be mentioned in a decent lady's house!'

'Stay, Martha; not so fast. Elizabeth was lawfully married to the rascal—please to remember that. She is as honest as yourself'—he said this fiercely—'she made a mistake in her choice—taking lacquer for gold; and in leaving her home.—Never mind; we'll drop the subject. I've not come to talk about the poor girl; my visit is for a different purpose.'

'You have a purpose, then?' said she inquisitively.

The old man drew his chair nearer to her, saying confidentially: 'I've just come from Mr Frampton's; I've been making a new will.'

'A new will!' repeated his niece, opening her eyes. 'What is that for?'

'You shall hear. It is twelve years since my girl left me; she and her husband went to Australia, that is certain. Some time after I heard they had gone to Canada. Now, all traces appear to be lost. If Elizabeth returns in the course of the next ten years, she will inherit my property; if not, as my next of kin—I have no relations, save very distant ones—it will, according to law, revert to you.'

Mrs Drew's face brightened up. 'As your brother's daughter, I suppose so,' said she; 'though ten years seem a long while to wait.'

'I have not felt well lately; and for some days there has been an unaccountable weight on my spirits, as if something were going to happen; so I thought I would make a new will, leaving my forgiveness to my mistaken child, to whom, perhaps, I was too severe when I disinherited her; but I have taken care the rascal shall never claim a penny of it!'

'It's all news. You must have some refreshment—a hot chop, and a glass of good port, to hearten you up,' cried Mrs Drew with sudden cordiality, ringing the bell for luncheon.

The old miller did not refuse her offer: he had felt his loneliness of late; and though his niece was not affectionate, yet he found a species of comfort in being with a relative.

After his luncheon, and talking of bygone days and old friends, which did him as much good, he brightened up; and parted with her on more friendly terms than they had been for some years. He had other business to transact in the town, he said, and must get back home, for it looked as if it were going to be a wet night.

'Did you drive in, uncle?' asked she.

'No,' he answered; 'I rode over on Gray Dobbin. I have put him up at the Crown.'

And so they parted, the old man just touching her brow with his lips.

'Delightful!' cried Mrs Drew to herself, when she was alone, rubbing her hands with satisfaction. 'Everybody says he's rich. Really, he looks as if he were booked—very shaky. Seventy is not such a great age; but fretting for that minx Elizabeth has undermined him. Will she ever return, I wonder? That's the question. I think she must be dead, or she would have bothered him for money before this. That husband of hers reckoned to make money of his father-in-law. Roughing it in the colonies would soon wear her out. Fool that she was, to run

away from a good home with a man who had nothing! Well, perhaps it may make it better for other people.'

It is seen by the tenor of her thoughts that Mrs Drew was an unfeeling, worldly woman.

Mr Twyford had scarcely left the house an hour, when another ring at the door-bell announced a visitor.

'A person wishes to see you for a few minutes, mum,' said the maid-servant.

'A man or woman?' asked her mistress.

'She's a faded-like sort of lady,' answered Sarah.

'With a begging-letter, I'll be bound—or somebody worrying for a subscription,' exclaimed the projector of the bazaar for charitable purposes. 'I'll not see her. Tell her I am engaged.'

Presently Sarah returned. 'She says, mum, as how she'd be very much obliged if you'd see her just for a minute.'

'When I say no, I mean it, replied Mrs Drew shortly; then listening, she heard the visitor depart.

Ten minutes afterwards, her husband's voice sounded from the foot of the stairs in the hall; he had been sought in the bank by the 'faded lady,' and brought her into his house through the private door of communication.

'Martha, Martha, come down!' he called out; when she descended, wondering. 'You little know who is in there,' whispering, and motioning over his shoulder towards the parlour door. 'Be civil to her.'

'Whoever is it?' said Mrs Drew, opening the door and entering the room.

The faded lady rose from the chair on which she had been seated, with an air of fatigue. Faded indeed—but still beautiful; though the face was white and wan, it retained its perfect oval; the classical brow and charm of large lustrous eyes—too bright—for it was the brilliancy of consumption. Her figure was fragile and drooping; her attire all too thin and inappropriate to the season, damp with rain, and in the fashion of bygone years.

'Elizabeth!' she cried, halting, struck with dismay.

'Yes,' replied the poor wreck, in a sighing voice. 'I have come back once more; and have called to ask if you will break the news of my return to my father. I fear going to him suddenly; at his age the surprise might be too much for him. I must beg his forgiveness—before I die.'

'I'll not mix myself up in anything of the kind!' returned Mrs Drew angrily. 'It's all very fine saying you've come back to ask his forgiveness, now you are poor, as I conclude you are—glancing at the worn shabby dress. You should have thought of it when you were prosperous.'

'I have never prospered.'

'Martha!' said the bank manager reproachfully.

'Is my father well?'

'I shall give you no information. I washed my hands of you years ago, when you ran away with an adventurer;' and she turned her back, as if to leave the room; but Mr Drew gave her a warning glance as she passed him, which caused her to remain. The kind-hearted man could assert himself when thoroughly roused, and then his wife got the worst of it.

He now seated himself beside Elizabeth. 'Your father is pretty well for a man of his years. He was with me in the bank an hour ago, and is most likely still in the town. Would you like me to try and find him, my dear?' he asked kindly.

'Oh Mr Drew, thank you, thank you!' she cried, clasping her hands.

'He always puts up at the Crown. I shall ascertain his whereabouts there. You sit still here until I come back;' and the good man departed.

Left alone with her cousin, Mrs Drew did not take a chair, but stood, staring at her with a hard expression. 'Well, you see what flying in your father's face has brought you to,' said she. 'Thank goodness, I was always dutiful to mine.—Have you any children?'

'I have had three,' faltered Elizabeth. 'They died in infancy. One lived until four years old—my darling—she was so sensible. I learned to believe in Heaven through my child; she was an angel sent to me.' The unfortunate Elizabeth covered her face with her thin hands and wept silently.

'Is your husband kind to you?' asked Mrs Drew.

'Constant disappointments have much tried him now. At first he was kind; but he thought my father ought to have forgiven me and him; then he became cross because I refused to write asking for assistance.'

'Where have you been all these years?'

'First we went to Brisbane. He could not obtain employment as a clerk or a teacher, and he was not trained for manual labour; so we went to Canada, afterwards to the States; lastly, to California. Nothing succeeded with him. My health failed from the time I lost my little ones. Then he thought he might do better in England, after all; and I longed to see my father once more before I died—so we have come.'

'Well may you regret your conduct.'

'Yet some excuse might be made for me, a giddy, motherless girl, and my father too old to understand young people. His strict principles I miscalled severity. Well, it is all gone and passed now. I trust to see his dear face once more—to hear him say he forgives me; then I will lay down my head and die.'

'I really believe she is in a deep decline,' thought the pitiless woman to herself; then aloud: 'Where are you staying?'

'We only arrived at Liverpool yesterday, and came on here at once. My husband is waiting for me in the town; I hope he will not meet my father,' said she nervously.

'I'm glad I never was a beauty,' said Mrs Drew piously, 'or perhaps even I might have been led astray by flattery—not but that I was nice-looking, and scrupulous in my conduct. I had many offers, and might have done better than marrying Mr Drew, only'—

'No, no!' cried Elizabeth energetically; 'that would be impossible; he is a good kind man.'

At this moment Mr Drew returned, with a radiant face. 'I soon found your father, my dear,' he said, 'who waits to receive you with open arms at the Crown. He declined coming here. You must be guarded in what you say, remember. Your husband's name had best not be

mentioned. Him, he will never forgive.—Come ; I have a fly waiting ; I will take you to him.’

Elizabeth raised the bank manager's hand to her lips and kissed it.

‘She can't live, with that hollow voice,’ soliloquised Mrs Drew when they left the room. ‘I shall not have long to wait for the property.’

Elizabeth Ashworth, after an affecting and perfect reconciliation with her father, sought her husband at the small railway inn at the outskirts of the town where he awaited her return. He was furious when she related the results of the interview she had unexpectedly obtained, which were, that he would receive her back home and reinstate her as his heiress, on condition that she parted from her husband, whose treachery in beguiling a girl of eighteen from her father's roof he could never forgive.

Ashworth, after upbraiding his wife in not having overcome the old man's prejudice, rushed from the house.

Poor Elizabeth was found lying on the floor in a fainting fit. Overcome by excitement and fatigue, she was carried to a bedroom, a doctor sent for, who pronounced her condition to be precarious through failure of the heart's action. Although receiving every care and attention, she never rallied, and by morning's dawn she had passed away, being mercifully spared the knowledge of her father's tragic end.

AN OCEAN GRAVEYARD.

A low sandy fragment in the Atlantic, right in the track of vessels voyaging between Europe and British North America, is responsible for more maritime disasters than probably any piece of land of equal area in any part of the world. This is Sable Island. It has a curious history, as well as some peculiar physical features. An island, moreover, on which as many as two hundred lives have been lost by shipwreck in one year, must have special interest for a maritime people.

Sable Island, then, belongs to the province of Nova Scotia, is about eighty-five miles east from the northern promontory of the peninsula—Cape Canseau (or Canso)—and is in latitude 43° 60' N., long. 60° W. Its general physical appearance is like that of a collection of hard sandbanks with loose white ends. The surface is not level, but undulating ; and its colour so much resembles that of the surrounding sea on a cloudy day, that it is not difficult to understand why vessels have so often run upon it. Fifty years ago it was noted that the island was diminishing in size, for the spot on which the superintendent's house had been built some years previously, was then covered with two fathoms of water. On the other hand, new shoals and banks are being constantly created by the alternate and combined action of the wind and sea.

There is not a single tree or shrub on the whole island, and its only indigenous vegetation is a strong coarse bent-grass, interspersed with a few whortleberry and cranberry bushes in places where the wind has scooped out hollows. So loose is the soil, or sand, that the surface is

constantly altering, and a conical hill once only a few feet high is now over one hundred feet, and is still growing with the tributes of the storms. And often, after a gale, the skeletons of shipwrecked mariners, and the ribs and timbers of derelict vessels which have been buried for years, are exposed by the pitiless sea-blast.

It has been said that those who have not personally witnessed the effect of a storm on this place can have no conception of its horrors. The thunder of the sea when it strikes this long thin line of sand is something appalling, and the vibration of the whole mass under the mighty impact seems to threaten a collapse that never comes. The south end is completely covered with driftwood and wreckage driven ashore by the waves ; and at each end there is a dangerous sandbar, which in a storm raises continuous lines of breakers—in the one case sixteen, and in the other twenty-eight, miles long—making about fifty miles of broken water. The prevailing wind in the summer months is south-west, and is usually accompanied with fog. In winter, snow seldom lies, and the cold is much abated by the seabreeze.

Dr Dawson of Montreal, in his work on Acadian Geology, published some twenty years ago, mentions that it had been reported to him that within the previous twenty-eight years the western end of the island had decreased in length by about seven miles ; but that it had increased in height, especially at the eastern end. There is evidence, he thought, that the whole island is moving eastward, as the natural effect of the prevailing winds. More recent measurements give the present length of the island as little more than twenty miles, and its breadth about a mile. In 1802, when the Government Station was established, the length was marked at forty miles ; so that there has been a decrease of about fifty per cent. in bulk within about eighty years. There is a tradition that when discovered by Sebastian Cabot in 1447 it was eighty miles long, ten wide, and three hundred feet high ; but we have not been able to find any authority for these measurements.

Dr Dawson's explanation of the geological formation of Sable Island is, that it is the summit of one of those huge banks of sand, pebbles, and fragments of shell and coral, which form a line extending under the waters of the Atlantic, parallel with the American coast, from Newfoundland to Cape Cod. The whole of the sandy surface, he concludes, must have been washed and blown up by the sea and wind, and may in course of time be washed and blown down, as the mass is driven gradually to the edge of the submarine bank, and so into deeper water.

In the centre of the island there is a valley extending almost the whole length, in which is found the principal growth of grass and bushes. Eight miles of this valley are filled by a lake, which is separated from the sea by a narrow ridge of about two hundred yards. At one time the sea made a breach into this lake on the north side, and a commodious inland harbour was formed, in which coasters took refuge. But another storm closed it again after a time, and two American schooners were effectually imprisoned.

At each end of this lake there is a hut, fur-

nished with provisions for shipwrecked mariners, and with written directions how to find the house of the superintendent, which is about the centre of the north side of the lake. There is a large barn with stores here, and efforts are made, not with conspicuous success, to grow vegetables. Oats and rye have also been tried, but did not ripen. Rabbits abound; and at one time there was a herd of wild cattle, but these were killed off by various crews of adventurers before the present settlement was formed. Since then, horses have been introduced, and the island is now famous for a breed of strong, active, sturdy ponies, resembling those of Shetland. They at one time increased beyond the means of subsistence, and numbers had to be killed every year, not only for the good of the rest, but also to provide fresh food for the crews of wrecks, who have often to remain a long time before they can get across to the mainland. The meat is said to be tender and palatable. There was once, also, a herd of wild hogs; but the whole perished in an unusually severe winter some seventy years ago, and it has not been thought advisable to renew the stock, as their feeding among the wrecks was by no means free from horrible possibilities. During the summer, the island is visited by great flocks of sea-birds, as also by shoals of the hair-seal, which resort thither for breeding purposes.

The walrus, or sea-horse, at one time frequented the island, and was a valuable object of pursuit. There are notes in the old colonial annals which show that for a long term this island was a place of annual resort for both English and French fishermen. There is mention of a collection of four hundred pairs of walrus teeth, valued at three hundred pounds, and another of skins, furs, &c., valued at fifteen hundred pounds. The walrus is now extinct on Sable Island; but Dr Dawson ascribes its former presence there to the fact that the sandbanks form a meeting-place of the icy Arctic current and the Gulf-stream. The former brought the walrus and the seal; the latter, the driftwood of southern latitudes; while the mingling streams cause the deflection of the current, which throws navigators out of their reckoning and on to the sandbars.

So much for physical attributes, which it will be agreed are by no means attractive. Yet this uninviting sandbank in the Atlantic was really the situation of the first European settlement in what is now British North America. From that circumstance alone our interest is arrested.

It happened in this way. In 1534, Jacques Cartier, a pilot of St Malo, discovered Acadia, and in the following year the St Lawrence. He took back such glowing accounts to France that the French king determined to found a colony in the new land. In 1541, therefore, Roberval was nominated Lieutenant-general of Canada, and was sent out with a fleet to form a colony. The experiment was a failure—from what causes we need not now inquire—and Roberval returned to France with the remnant of his company.

For several years nothing more was done, until, in 1583, Sir Humphrey Gilbert set out from England with two hundred and sixty men to found a colony in Newfoundland. That also was a failure, and again there was a pause. But in 1598 the French again wakened up, and Henry IV. gave the Marquis de la Roche a commission

as Lieutenant-general and Viceroy of Canada, and sent him out to select regions for colonisation. De la Roche took with him forty-eight convicts from the French prisons, with whom he was to found a penal colony. The first land he sighted was Sable Island; and after a cursory inspection, he concluded that this was the very place for a settlement. So he landed his convicts, and then went on to explore Nova Scotia, intending, let us charitably suppose, to return to his island settlers. But stress of weather compelled him to take to the open sea, and he sailed for France, leaving the convicts to their fate. There they remained for several years, until the king, hearing of the circumstance, sent a vessel to bring them away.

Meanwhile, these pioneer colonists had not been idle. A providential wreck had supplied them with timber and a few sheep. They built huts, and lived on the sheep as long as they lasted. Then they hunted seals, and collected the skins while they fed on the flesh. It is said, also, that they found a few wild cattle, the produce of some animals left there by a previous French navigator in 1518; but as to this authorities differ. At anyrate, when the relief-ship came, there were only twelve of the original company who had survived the hardships, and these twelve were clad in rough seal-skins and were living in a rude hut. They were taken home and presented to the king just as they had been found; and he was so touched at their condition and sufferings, that he gave all of them a free pardon and a grant of money. It is sad to have to state that the unfortunates were robbed of the skins they had collected, which were worth a good deal of money, by the commander of the relief expedition; but they afterwards recovered the amount by process of law, and history says that they became prosperous fur-traders.

Possibly some of them went back to Sable Island, for when a vessel on a voyage from Connecticut to England, was, in 1635, wrecked on Sable Island, the crew found there a number of Frenchmen, who treated them kindly, and assisted them in reaching the mainland. Two years previously, John Rose, a Boston man, was wrecked there; and there were no Frenchmen then. But the account he gave of the place tempted several of the Acadian colonists to embark for the island, to hunt the wild cattle and the seals and walrus.

Some years later, a number of Boston adventurers organised a company to explore Sable Island; but when they arrived they found sixteen Frenchmen who had wintered there and had killed nearly all the cattle. The Bostonians did not do much good with the seals, and returned home; but two years later, twenty men set out from Boston again for Sable Island and remained away over two or three winters. After this, Sable Island expeditions from Boston became a regular thing, until there were no more wild cattle to kill, and hunting the sea-horse ceased to be profitable.

This was as long ago as the later half of the seventeenth century; and since then, Sable Island has ceased to have a commercial value. But it has acquired an importance of another and a dismal sort, so much so that the Government of Nova Scotia had to establish a beacon and

refuge for shipwrecked sailors, under the charge of a resident superintendent, with a small company of eighteen men, who are stationed at different parts of the island, on the constant lookout for distressed vessels. This, however, is a beneficent work which has only been undertaken within the present century—in 1802.

Sable Island was, before the Government took it in hand, a sort of paradise of villainy. It was not only the scene of countless wrecks, but also the chosen resort of heartless wreckers and blood-thirsty pirates. How many crimes have been committed on its sandy desert—how many criminals it has sheltered and enriched—will never be known. But the Nova Scotians regard it as a land of ghosts, and shudder at it as a place of fearful legend and of awful fact. It would be hard to find thirty miles of land anywhere more crowded with weird association and ghastly history. No wonder it is called by the Acadians, 'the Ocean Graveyard.'

The first wreck that occurred here of which there is any authentic record was that of one of the ships belonging to the unfortunate expedition of Sir Humphrey Gilbert above referred to. That was three hundred years ago, and the whole sum of disasters of these three hundred years will never be known. The centre of storm, of fog, of sandbars, of apparently endless breakers, and of swirling currents, Sable Island is feared by mariners of all nations. The catastrophe which led to the establishment of a life-shelter there occurred in 1801. The transport *Princess Amelia*, with upwards of two hundred officers, recruits, and crew, and carrying the household effects of the Duke of Kent, was cast on the sandbanks, and every soul on board perished. A gunboat which was sent to search for survivors was wrecked in the same manner, although not with such loss of life. Then it was decided that it was time for Government to do something.

A party was settled on the island for the express purpose of succouring shipwrecked people and saving property, and to ensure them from the depredations of pirates and free-hunters. A proclamation was issued forbidding any person, under pain of imprisonment for not less than six years, to reside on the island without a Government license. The risks are now too great for wreckers, and there is nothing else to attract adventurers. The principal station, as we have said, is near the centre of the valley, and there are five out-stations at which men reside to keep watch. These out-stations have signal arrangements for communicating with the head-station and also with vessels. Then there are, besides, the two refuge-houses already mentioned, the doors of which are always left open, and in which are wood and matches for fire, a supply of water, a bag of biscuits hung on the wall to be out of the way of the rats, and a board of written instructions for castaways. At different stations there are lifeboats, surfboats, life-buoys, rocket apparatus, &c.; and a supply of horses is always kept in readiness to drag the boats, &c., wherever they may be wanted.

We have mentioned rats, and concerning these an interesting incident occurred. It seems that many years ago the island was absolutely overrun with rabbits, which find very suitable places of residence in the sandy soil. But once

an old Norwegian vessel which was overrun with rats was cast ashore. The rats landed, and increased and multiplied so rapidly that they almost annihilated the rabbits, besides playing havoc with the Government stores. So a cargo of cats was imported, and the cats killed off both the rats and the rabbits. Then the cats so increased and multiplied that they in turn became a nuisance, and dogs were imported to extirpate the cats. What became of the dogs is not related; but a few years ago rabbits were again introduced, and rats also reappeared from some other wreck. The old story has been repeated, and two years ago the town of Halifax was beaten for a supply of cats, which were again shipped off to Sable Island. And there the struggle for survival between the rodents and the felines is now again in active progress.

We have said that no persons but those engaged in the life-saving establishment are allowed to reside on the island without a Government permit. There is one class, however, to whom a permit is never refused, and that is the victims of alcoholic indulgence. No drink is obtainable on Sable Island, and thus it has become an asylum for the confirmed inebriates of Nova Scotia. So that this dismal, death-strewn, ghost-haunted, horrible Atlantic excrescence does some good purpose, after all, in spite of all its evil deeds.

AN ELECTRICAL BURGLAR-TRAP.

As a member of the 'special staff' to whom is entrusted the duty of dealing with telegraph business at race meetings and other events of irregular and itinerant occurrence, I have visited most towns of any importance in England, and have been a spectator of, and in some cases a participator in, some curious incidents, one of which I propose to relate here. Many of the most successful meetings, from a racing-man's point of view, are those held at places otherwise of very little size or importance. As an example, it will be sufficient to mention Epsom. It was to a town in the Midlands ordinarily containing about six thousand inhabitants, that I, with five colleagues, including a supervisor, was ordered in the autumn of 187—. The event was a two-day race meeting. The first day was fine, with occasional showers; the racing was good; and as a large company was present, we had enough to do not only at the Grand Stand, but also later in the evening at the town office, whence we despatched a large quantity of press-work by means of a 'Wheatstone,' which had been sent for the purpose. It was eleven o'clock before we finished, and we then had a good half-hour's walk to our lodgings.

The second day was awful. Rain fell in torrents the whole afternoon. Of course the programme was carried out; but, beyond official results and 'received' messages, we had very little to do. It is the only day I can remember during which our boss did not stir out of the office. He generally contrived to have some business to transact outside about the time fixed for each race. This day, however, the persistent downpour was too much for him. After the third race, he sent me to one of the reporters on

some business. I found my man in the weighing-room, a small temporary wooden shed at the back of Tattersall's ring.

When I entered, the jockeys were being weighed in, and there was apparently some difficulty or dispute, as the process was an unusually protracted one. I waited, leaning against the back wall of the shed, and as I did so, became conscious of voices whispering outside. I caught the words, 'A bloke with a big red nose and one eye;' and my attention was arrested at once, for this was a description of our counter-clerk. I listened attentively and with increasing astonishment. The voices were those of two men; and the gist of their conversation was, that a plot which had been formed to rob our office of the cash-box on the previous day had failed, owing to the fact that Harper, our counter-clerk, had taken the box into town early in the afternoon, instead of, as was the practice, at the conclusion of racing. He had, however, been closely watched, and seen to place the box in the local postmaster's safe at the town office. The safe was in the room in which we worked in the evening, and was an old-fashioned, almost obsolete contrivance. All our movements must have been very diligently followed, as the men knew not only the exact position of the safe with respect to the doors and windows, but also at what hour we closed the office, and the whereabouts of our lodgings. They had also ascertained that no one remained during the night in or near the room where the safe was.

The upshot of the conversation, which occupied less time than it has taken me to relate it, was, that the town office was to be entered that night as soon after we had gone as would be considered safe. Entrance was to be effected from the back-yard, through the window of a small room adjoining the larger one in which we worked. Further details I failed to overhear, as the dispute at the weighing-chair, which had been gradually growing warmer, now waxed loud and furious. Taking advantage of the noise, I slipped out and hurried to the office. Taking the boss on one side, I told him all. He was for informing the police at once, and having the place guarded and the thieves scared off; but after a lot of persuasion, I talked him over, convincing him how much more to his credit it would redound if he himself captured the robbers red-handed and unaided by the police. I expounded to him a plan, the main idea of which had struck me at the first moment, to which he listened attentively, and occasionally smiled approvingly. When I ended, he said: 'It would do very well but for one thing. It involves three of us remaining concealed in the office?'

I assented.

'You say they watched us leave last night,' he went on, 'six of us. What will they think if only three leave to-night?'

I was nonplussed.

'I rather like the idea,' resumed the boss; 'but I think we should have help. Suppose we get a couple of Schinken's men?'

Sergeant Schinken was a kind of semi-public, semi-private police officer with a staff of men, who were largely employed by race committees in the task of preserving order in the enclosures, and excluding bad and doubtful characters.

They travelled about from meeting to meeting like ourselves, and in this way a sort of intimacy sprang up.

'Oh, they'd just be as bad as the locals,' I said. 'They'd want to boss the whole affair, and very likely spoil it. I'll tell you what: I'll ask three young fellows I know to come and have a game at cards at our diggings to-night. I'll tell them to call for us at the office half an hour or so before we close. At closing-time we can make some excuse, and send them off with our own three men, whilst you, Harper, and I remain.'

He still hesitated. I could see he was again more than half inclined to let the police deal with the matter. Of course his responsibility was heavy; and should anything go wrong, he would certainly be severely censured. I had, however, the utmost confidence in my plan, and would or could see no possibility of failure; so that, eventually, I succeeded in gaining his consent. This done, I was only anxious for the racing to conclude, that we might get down to the town and prepare our surprise party. At five o'clock the final race was run; and an hour later we were hard at it in the town, wiring full accounts of the day's doings. Only the three of us already mentioned knew of the projected attempt and our counter-plan; and we, convinced that we would be overlooked, assumed to the bent of our abilities an ordinary manner and bearing. Harper produced as usual his cash-box and sheets, counted and balanced his account, telling the money, which amounted to about eighty pounds, out on the counter before him. Finally, he replaced it in the box, which he handed to the boss, who placed it in the safe, closing, but not locking, the door.

Meanwhile, I had, quietly and unobserved, procured a box very similar to Harper's, and after partly filling it with some odd pieces of metal, I fastened one end of a long wire to its brass handle. I prepared another similar piece of wire. Ostensibly for working purposes, I had gathered all the batteries at our command underneath the counter, and when the work was over, I quietly knelt down and joined them all together in series. At the same time I fastened one end of my spare wire to the negative pole of this monster battery; and then, standing up and leaning over the counter, succeeded, unnoticed, in attaching the other end of the wire to a narrow brass rail which ran along the top edge of the counter. I must explain, that in order to reach the safe from the pantry door, as we called it, it was necessary to pass almost the entire length of this counter, and of course to re-pass it in returning.

The hour for closing arrived. My three friends had been waiting some time. Everything being ready, the boss sent our three colleagues home, saying we would follow shortly. The three guests went with them. It was still raining, and they hurried off. The gas was immediately turned off; and I at once opened the safe and removed the cash-box, which Harper put in a place of safety, and substituted the one I had prepared with the length of wire. There was plenty of slack wire, which we brought round the back of the safe, over the other end of the counter, fastening the free end to the positive pole of the battery.

All was now ready. We hid behind the counter and waited. Harper, who was very bitter against the thieves, on account of their unflattering description of himself, took up his place close to the Wheatstone transmitter, a clock-work machine driven by heavy weights, and capable of attaining a very high speed.

An hour passed. It struck twelve. The rain was still beating against the windows. I was stiff and cold and weary, and was beginning to wish we had called in the police, when I heard something a trifle louder than the rain at the pantry window. There was a quick scratching sound like a nail drawn across a slate, and immediately after we heard the window-latch slipped back and the sash quietly raised. The men were certainly expert at their work. Had we not been alert and expecting them, we should not have heard their operations. In a few moments the pantry door opened with a gentle creak, and the marauder was in the room. We held our breath. Confident in his knowledge, the man had no light save what came from the windows. He approached the safe, and could not altogether suppress an exclamation of surprise and delight at finding it open. He was destined for more surprise and less delight shortly. Peeping carefully over the counter, I could just discern him in the dim light, with the box in his right hand, turning to retrace his steps. As I had anticipated, and indeed reckoned on, he stretched out his empty left hand to guide himself along the counter, and—seized the brass rail. As he did so, the full force of the battery struck him. 'Blazes!' he shouted, or rather yelled out. He tried to let go the rail, but in vain. Then he attempted to drop the cash-box, but that stuck to him too. He began to hop about and stamp and groan and swear and pray continually and all at once. We could hear the cash-box thump and rattle against the floor or the counter as the current jerked his arm spasmodically to and fro.

At this point Harper quietly turned on the transmitter and pushed the lever over to top-speed. Any one who has heard an instrument of this description set in motion at its maximum speed knows what a sensation of coming disaster is given by the rapidly increasing revolutions of a score of wheels, which gather speed and force and noise until it seems as if the whole machine will burst up by excess of velocity. Imagine the effect this had on the nerves of the man already in the grip of some mysterious, unfathomable agony. Of course he jumped to the conclusion that the noise indicated some fresh increase of his torments. He began to scream for mercy. 'Oh-h-h! Help me. Murder! Oh gentlemen, stop it! Don't kill me. Help! Help!' He writhed and struggled, fell on his knees, and by an enormous effort, tore the rail from its place; but the battery wire still held on. For a time his cries and struggles redoubled; but at last he lay exhausted on the floor. I then turned off the current, and we turned on the gas. There lay our man, his face gray and distorted, as though he had had a fit. He was quite young. After he had somewhat recovered, he begged hard to be let go, gasping out: 'You've done it hard enough on me.'

After some hesitation, the boss decided to let him go. I fancy he was not quite at his ease

as to how his action would be regarded by the department. Another reason was that the second man had got clean away. He had been waiting outside; but on hearing the disturbance and his pal's cries, had fled and left him.

The man was grateful for his release, and walked slowly and heavily away. He was evidently severely shaken, and I should scarcely think would ever try to rob a telegraph office again.

HEADS AND TAILS.

THE trade in animals and their products is very extensive, and it will be thought curious that there are special trades carried on with the extremities of animals. The Heads and Tails have relative values. As food delicacies, the head of the calf, the sheep, the ox, the wild-boar, and the domestic pig, are appreciated. So is the cod's head. The trunk of the elephant, and the moufle or loose covering of the nose of the great moose-deer or elk, are also dainties in some countries. Animal and human skulls are esteemed by the craniologist and for the cabinets of museums; and the savage head-hunter prides himself upon the number of skulls of his enemies he possesses. The mounted heads of animals adorn many entrance halls and rooms. The ram's head is occasionally converted into an ornamental mull or snuff-box.

There are other animals whose 'head and front' have a commercial value. The snout or rostrum of the sawfish and other species, called in the Eastern Archipelago the 'juparang,' is a very considerable article of trade for the China market, being used as medicine. Mr Anderson, in *A Mission to Sumatra*, says he purchased at Delle, for half a dollar, the largest he had ever seen, being five feet five inches in length, and armed on each side with teeth of an immense size, some two inches in length and fifty-six in number. In India, a reward is offered by the Government for the destruction of tigers, leopards, bears, wolves, hyenas, and other wild ferocious animals. For tigers, about five thousand pounds is paid for the slaughter of fifteen hundred annually; and often two hundred and fifty heads have been brought by natives in a single day, to claim this reward. As much as twelve thousand pounds was paid in 1889 for the destruction of one hundred and ninety thousand wild beasts.

In commerce, the collective name 'head' is applied to other objects than the head of animals. A bundle of flax two feet in length, weighing a few pounds, is termed a 'head.' It is also a trade-name for the thirteen plates of tortoise-shell on the carapace of the hawk's-bill tortoise. The state of a deer's antlers, by which his age is known, is spoken of as his 'head.' At the present day, the oldest stags in Scotland, crown or royal stags, seldom present more than ten or twelve 'points.'

Passing now to tails. The ox-tail and the tail of the kangaroo are much esteemed for soup; and the tail of the beaver, which consists of a gristly kind of fat, is considered a great luxury when it is trapped. The brush of the fox is prized by sportsmen as a trophy, and is often

mounted as an ornament. The broad and heavy tail of the sheep bred in Asia Minor, and for a long time common in South Africa, is not the least valuable portion of the animal. It is composed wholly of fat, which differs essentially from tallow or any other fat excepting lard. Its delicacy enables it to take the place of butter for culinary purposes, and it is in many respects far superior, while also decidedly cheaper. Moreover, 'tail's fat,' as it is called, is as much an article of merchandise there as any other necessary or comfort of life, and a market unsupplied with it would be deemed poor indeed. It fetches a medium price between tallow and butter, and is almost entirely used by the natives instead of the latter.

The negroes esteem the tail of the alligator a delicacy; and Dr Holbrook states that it is tolerable eating, although Catesby found its peculiar taste and odour disagreeable. The tails of the lobster and crayfish form an article of commerce in America, Greece, and Russia, either dried or canned. In Europe they are chiefly sold dried.

One or two million squirrels' tails come into commerce annually: they are known as Calabar tails. The sable tails on mandarins' caps in China denote that the wearers are Tartars. The tails of the squirrel and ermine (sable tips) are esteemed for fur trimmings, and for making fine artists' pencils, being superior for this purpose to all other hairs. Many thousands of martens' tails are also imported. One species of marmot has a black tail eight inches long, or about half as long as the body. The ring-tailed monkey could a tail unfold, but it has no trade value. The point only of the tail of the ermine being jet black, is inserted at intervals into the prepared furs as an ornament. The ermine trimmings of the sovereign and royal family are not, however, spotted with the tail of the ermine, but with the paws of the black Astrakhan lamb, or other suitable black fur.

The tail of the musk-rat, also called the Desman, is placed among clothes and linen in Turkey and Russia as a perfume, to keep away moths. The musk-rat of India, called Mondjourou, is the *Sorex murinus*. About one million and a half of musk-rats' tails are said to be imported annually into Europe, and are sought for by perfumers. The tail of the Musquash, known as the *ondatre* in France, forms a considerable article of import into India, being regarded by some as an aphrodisiac.

The bushy horse-like white tail of the yak, or grunting ox of Tibet, is much prized in the East, where it is used to brush away flies, and also as an emblem of authority. In India these tails are mounted on ivory or silver handles, and are called 'chowries.' State elephants are taught to carry one of these chowries in their trunks and to wave it backwards and forwards. Nearly ten thousand pounds was paid for these tails brought into India in 1890. The tail of the African elephant is used as a fly-flapper and an emblem of authority. The hair on it is stiff and smooth, of glossy black colour, fourteen to fifteen inches long, the size of small iron wire, solid, of a horny nature, very tough, and will bear to be doubled and tied without breaking—though some are brittle—and therefore useful for

making braids to fish-hooks. Neat ornaments, as rings, brooches, &c., are made of them in parts of Africa and Asia.

The long hair on the tail of the horse is much valued for manufacturing purposes. A queue or tail of horse-hair, suspended at the end of a pike, terminated by a gilded pennant, is the emblem of authority of a Turkish pasha of the third rank; those of the first rank have three tails. The usage of these tails is of Tartaric origin.

The jackal's tail is much prized by the Metabele tribe in Africa. They wear a circle of them dangling from their waist-belt, and on their head a jackal's tail, so worn that it stands straight up on one side of the head at the same angle as an English cavalry forage cap.

In the West Indies, a rat-catcher is attached to every sugar estate, because the rats commit great havoc from gnawing the sugar-canes. A reward is therefore given for every dozen tails brought in; but negro ingenuity contrives to manufacture artificial tails. The imported mongoose, or ichneumon, in many islands, now takes the place of the rat-catcher. The same fraud was recently carried on by a mole-killer in Switzerland, who was sentenced to three months' imprisonment for swindling the authorities. The destroyers of moles receive a certain sum for each; but they are not bound to present the bodies to obtain the reward, but only the tails. The man in question delivered no fewer than two thousand, and received a sum of twelve pounds. Surprise was felt at the number; and on close examination, a great many were found to be artificial, manufactured by gumming a strip of the animal's skin on a bit of wire covered with paper. Similar frauds were recently discovered in Australia, where large sums are paid for extirpating rabbits. A clever schemer found he could buy the skins cheap in the towns and sell them at a good profit to the stock-owner as the result of his own killing.

The tail feathers of many birds are in great request, such as those of the peacock, Argus pheasant, and eagle. Those of the common peacock are much used in China for fly-flappers, and are also a mark of rank conferred by the emperor for special services. The tail feathers of the golden eagle are worn in the bonnets of most of the Highland clans, and by Zulu chiefs in South Africa.

PAWN AND TOBACCO IN INDIA.

PAWN (properly *pán*) is a luxury much esteemed by the natives of India. It consists of the fresh leaf of the betel-vine (*Piper Betel*), in which is placed a little red catechu, betel-nut, and quicklime; spices are also often added, and sometimes a piece of dry tobacco. Cloves and a piece of the root of the betel-vine are sometimes added medicinally, for colds and coughs, for pawn is also regarded as a stimulant. If a native of India be an opium eater, he adds some of his favourite narcotic. When these several additions have been made, the leaf is folded in a particular way and eaten with its contents. The betel-leaf is obtained from a creeper extensively cultivated

by the Hindus, who regard it as very sacred ; and it is with the greatest difficulty that any one who is a follower of another religion can obtain admittance into a plantation of betel-vines. The betel-nut is obtained from the areca palm, and is so called simply because it is eaten with the betel-leaf.

The visible effect of eating pawn is that the teeth, tongue, and lips all become red, and the two latter much swollen, so much so, that after a long course of pawn-chewing, the utterance becomes thick and indistinct, and the teeth black. The expectoration is also much increased, and is coloured a deep red from the same cause.

To our English taste, pawn is very offensive ; but the natives of India relish it, and regard it as a necessity. It is much eaten by Mohammedans of both sexes, and by the natives of Bengal. The Hindus of Northern India do not indulge in it so freely. Eurasians and others of mixed races frequently chew it ; and some are in the habit of continually taking it ; but it would be quite accurate to say that no person of pure English parentage is in the habit of eating pawn.

When a native pays a call upon a fellow-countryman, the master of the house immediately calls for pawn ; and when it is prepared, all present begin to chew it, carrying on conversation meanwhile. When the called-upon thinks that it is time for his friend to leave, he gives some gentle hint, such as, that he hopes his friend will call again soon ; and the caller rises to depart ; but before he leaves the house, he is presented with more pawn, so that he may not leave with his mouth empty.

Bengali baboos (native gentlemen) when leaving home for business habitually supply themselves with pawn ; and any day they may be seen going along the streets with lips and tongues swollen and red. It is not considered etiquette by the natives of India to eat pawn or anything else in the presence of social superiors or employers.

Another thing in which the natives of India indulge just as much as in pawn is tobacco. The substitute for the English pipe which is used in India is the hookah. The base of the hookah is a brass vessel containing water ; this serves as a pedestal, and into it are fitted side by side two tubes about an inch in diameter. One of these tubes is about two feet in height, and has at the top a little round earthen vessel called a chillum. This chillum is a cup about four inches in height, and the same in width ; at the bottom it has a hole just large enough to be fitted on to the tube. A little earth is put loosely into the hole, to prevent the contents falling down the tube ; then some tobacco is put in, and over this some live charcoal. Those who are addicted to the use of opium frequently place some of the drug in the chillum along with the tobacco. The second tube runs up parallel with the first for some distance, and then branches out sideways for two feet or more : to the end of this tube the smoker applies his mouth and—enjoys himself. The smoke being drawn through the water in the pedestal makes the peculiar sound which causes the hookah to be called the 'hubble-bubble.'

This description of hookah is most commonly

used among the better classes ; but there are many varieties. The poorer classes make a cocoa-nut shell serve the purpose of the brass water-vessel. The chillum is fixed on to a tube which is put into a hole at the end of the shell ; a second impromptu tube is formed with the hand and applied to a side-hole, through which the smoke is drawn.

It is not, as among the English, that only some men smoke tobacco ; but, with rare exceptions, all natives, men and women, indulge in this weed in some form or other. The hookah is smoked as a refreshment and sign of fellowship by the natives of India, and not merely as a luxury. When a group of natives are seated together, and, as is the custom, the hookah is passed round to each in turn, it is considered very bad manners for any one to decline to have a few puffs. If the hookah is thus refused in a friend's house, or while one is the guest of another, it is regarded as an insult. If, for any reason, a native is put out of caste, the fact is strictly marked by his former caste-fellows' refusal to smoke with him ; and any one who eats, drinks, or smokes with an out-caste, is himself out-casted.

It is curious how, while the Englishman speaks of 'smoking' tobacco, the Chinaman and native of Bengal speak of 'eating' it, and the native of Northern India speaks of 'drinking' tobacco, thus indicating that they regard it as one of the necessities of life. Tobacco grows freely in India, which may account for its cheapness and universal use.

A SEASIDE REVERIE.

A BLUE dome of heaven seeming
Faint blue 'gainst the sea, that, gleaming,
Trembles beautiful and bright ;
'Neath the island's purple steeps,
Dancing diamond-wise, it leaps,
In the sunny summer light.

And the wild high grasses blowing,
Listen to the tide in-flowing
With eternal melodies ;
Scarlets poppies kiss the feet
Of the young corn growing sweet
In the pleasant upland leas,

Growing in the sunshine sweetly,
While the summer wind goes fleetly
With light footsteps to the sea ;
Kisses he the laughing corn
As he goes this sunlit morn
With swift wings and merrily.

The sweet silence is unbroken ;
Rarely human words are spoken
On this yellow grassy hill ;
But the brown bee flying hums,
While for ever upward comes
The sea voice, never still.

No. 438.—VOL. IX.

SATURDAY, MAY 21, 1892.

PRICE 1½d.

A NORTH-COUNTRY 'LION.'

THOUGH neither Shakespeare nor Sir Walter Scott took Alnwick Castle for his theme of song, prophetically or retrospectively, there is a glamour about this Border stronghold of the ancient Percies that is confessed by most educated persons. Perhaps it is the romance of the old Border song, *Chevy Chase*, that has entered into it; or perhaps it is the renown of Hotspur, and the great part played by the Percies in the destinies of kings, or it may be something in the structure itself, that imparts this charm. Be that as it may, it is certain that any one wishing to see the Lions of the North would miss one of the most impressive if he failed to view Alnwick Castle.

This ancient fortress and residence was not built by the Percies, but was purchased in 1309, by Henry de Percy, who added much to its original strength and accommodation immediately afterwards. Considerable portions of the structure that he acquired, and several of the towers with which he enlarged it, are still standing, and show that the first builders enclosed as large an area as is now surrounded by the curtain-wall. It is not known whether there was a Saxon building on the site, as Northumberland was not included in the great survey we call Domesday Book; but mention of the Norman Castle occurs in a charter granted to William de Vesci by Henry II., which confirmed his right to all the lands and tenures of his father, Eustace de Vesci, including the castle and the whole honours of his grandfather, Ivo de Vesci. These de Vescies were men of note; their barony consisted of sixty manors; their castle was 'most strongly fortified;' and they played important parts in the wars and other business of their times; they founded two abbeys in the neighbourhood of their stronghold, and gave the burgesses of Alnwick the right of pasture over a great tract of moorland, which they still enjoy. Eustace de Vesci was one of the barons who secured for the nation the privileges conferred by the Magna Charta,

and married a daughter of the Scottish king, William the Lion; and William de Vesci, the grandson of this couple, was one of the thirteen claimants to the Scottish throne in the time of Edward I. It was after the death of this baron that Anthony Bek, whom he had left in trust of his Northumbrian estates, sold the castle to Henry de Percy, in the third year of the reign of Edward II.

The keep of this stronghold consisted then, as it does now, of a ring of towers enclosing a central courtyard; and it was placed nearly midway in an area of about five acres in extent, surrounded by a high curtain-wall, strengthened at intervals and at some of the angles with strong towers. There were two moats—one outside the wall, and the other inside, immediately surrounding the keep. Henry de Percy on taking possession built a new barbican, and had his lion and motto, 'Espérance en Dieu,' carved in a panel on the face of it; and he also built new entrance towers to the keep, and a new dining-hall in the keep, with vaulted cellars below it. We may picture him, bronzed with much service in the field, keen and active arranging these matters, of which, however, he had no long enjoyment, as he died about six years after the acquisition. His son probably completed these improvements, and others were occasionally made by his illustrious descendants, especially by the son of Hotspur, whose work has also been identified. When the fortunes of the family prevented, for a time, continuous residence in the north, the great stronghold was left very much to its fate.

In the eighteenth century, four hundred years after Henry de Percy acquired it, and on the marriage of the heiress of the Percies, the Lady Elizabeth Seymour, with the handsome Sir Hugh Smithson, who was created first Duke of Northumberland, a great renovation was accomplished. Many of the old features of the fabric were removed; the towers of the keep were made of uniform height, and the rooms within them made gorgeous with ornamental stucco-work, then much

in vogue. The castle became a commodious residence in the fashion of the day; most of the traces of its garrison use and service were obliterated, and the pleasure-grounds and parks around it were improved by very extensive plantations. In the course of another century the reasonableness and taste of these alterations came to be questioned; and in our own day the knightly structure has been again remodelled and re-embellished. About five hundred and fifty years after the first Percy, lord of Alnwick, ordered the commencement of the works he required, his representative, Algernon, fourth Duke, laid similar commands upon his architect, and upon various Italian artists of note, who forthwith made the Border fortress into the combination of Plantagenet castle and palatial residence we now see.

It stands on a bank on the south side of the river Alne, close to the great North Road, and is built of a mellow-toned sandstone. Of the towers forming the keep one rises higher than the rest; that was built by the fourth Duke, and called the Prudhoe Tower, for the reason that he was known as Lord Prudhoe before he succeeded his brother in the dukedom; and on the summits of many of the other towers, as well as on those along the line of circumvallation and on the barbican, are stone effigies of men throwing down huge stones or discharging arrows, and in other ways appearing to defend their fortress. These stand out boldly against the sky. On passing under the sombrous archway of the barbican, and emerging through an inner gateway beyond it, those who enter find themselves face to face with the keep, in a spacious grass-laid bailey, traversed by a curved stone-paved drive which conducts to the entrance of a second bailey, in which stands the approach to the innermost courtyard. The moat has been almost effaced, and the drawbridge has been replaced by a permanent way; but the Norman archway is the same through which King John passed to and fro on four visits, and under which Henry III. and three King Edwards also passed. On either side of this gateway are Henry de Percy's towers, and below the basement of one of them is the underground prison where captives languished; and just inside it, under a recessed arch, is the well.

Before entering the keep, the curtain-wall is worth a careful glance. It is dove-coloured, dun-coloured, and silver-gray, according to the aspect, and here and there a stone 'streaked with iron brown.' There are different modes of masonry in it, marking where it has been heightened by some of its owners, or a breach made in it by some of its besiegers, or a tower removed and its space filled up as time went by. Those who made these changes, who chipped and fashioned the stones to suit them for their purpose, took no account of the manner in which the previous builders had made their stonework; they did not say, 'We will build as our fathers built of old,' but went on in their own method, the Plantagenet masons with larger stones than those of the Norman masons, and the Tudor builders again with stones that were twice as long as they were high, and sometimes thrice as long. The small squarish stones of the Norman masons are now rounded at the edges and interstices with

the winds and rains and frosts of eight centuries, and are easily distinguished from the less worn work of later years by their regularity and smallness. The Plantagenet ashlar is nobler, larger, of more unequal heights, and make more stalwart walling; and the Tudor work has an air of mellowness, as though it was gradually ripening in the sunshine. Besides the towers, there are garrets, or turrets, along the lines of walls for the shelter of those who manned them. On the tops of some lengths, where it is about five feet thick, are paved footwalks for the warders. From the bases of some of the towers to the height of the tops of the walls are stone stairs to give access to them. If we look narrowly at the parapets we may see a few of the grooves and bolt-holes for the wooden shutters with which the embrasures were once provided for the protection of defenders. And in one length of the curtain may be seen gargoyles in the form of cannon-mouths, placed there in the days when cannon were of a different calibre from those with which we are now familiar.

The towers are of much interest. Their names signify their uses. There is the Abbot's Tower, for instance, which has three spacious chambers one above the other, with a spiral stone staircase giving access to the upper two, with arrow-slits only to light the lowermost and stone-vaulted one, and cusped or shoulder-headed openings of a larger size to light those above. There is the Constable's Tower, which is lighted by crossbow openings, and on the second floor by a double-transomed window of rare pictorial aspect, and which has external stone steps leading to this middle chamber, which opens on to the top of the curtain wall. There is the Record Tower; and there were the Falconers' and Armourers' Towers, now removed; and there is the Postern Tower, also of three stories in height, very strong, stern, and massively walled, with a low narrow doorway in the basement giving access to the wide length of bank between the Castle and the river. Some of them are used as museums; one is an *atelier*; in another is kept the large collection of antiquated arms with which the Percy tenantry proposed to resist Bonaparte's expected invasion; and archives are stored in another.

When we enter the residential part of the Castle, or ring of towers forming the keep, we think no more of the de Vescies; or of Henry de Percy; or of Hotspur; or of the old Earl portrayed for us by Shakespeare; or of the Percies who fought at Cressy, Bramham Moor, Shrewsbury, Towton, Percy's Cross, St Albans, Bosworth, and Flodden; or of the later Earl, 'well horst upon a fayr corser with a footcloth to the grounde of Cramsyn velvet,' who escorted the daughter of Henry VII. through Yorkshire, Durham, and Northumberland, on the occasion of her progress into Scotland to marry James IV. We think no more, even, of Chevy Chase, as we begin to ascend the magnificent staircase that leads from the entrance hall to the chief apartments. We begin to think immediately of Roman palaces, of San Lorenzo, of the Camera Borgia, of the Castella del San Angelo; of Michelangelo, Bramante, Raphael, and Giulio Romano. Panels of polished Italian marbles line the walls; Venetian mosaic-work is spread

upon the floor of the vestibule into which the staircase conducts us; arcades and pilasters, frescoes, friezes, bas-reliefs, meet the eye; and tones as of lurid sunsets on the Campagna, or of awakening sunrises on southern seas, recall gorgeous interiors of cinquecento workmanship in the Eternal City. The vestibule gives access to an antechamber, from which the library is entered on the one hand; and the saloon, and beyond that the drawing-room and dining-room, on the other. A corridor also departs from it in another direction, which furnishes communication with these and other apartments, as well as with other staircases and the gallery of the chapel.

The library, as is the case with all the other rooms, follows the contour of the tower in which it is placed. It is fifty-four feet long, with a bay in the centre that projects sixteen feet; and it has three fireplaces in it, with coloured marble mantel-pieces, and two tiers of bookcases, one above the other, all round it, the upper one of which is approached by a staircase in the thickness of the walls, and furnished with a light gallery. The ceiling is divided into four compartments, in which are octagonal panels with carved devices relating to the arts and sciences.

On the opposite side of the antechamber, which is hung with damasked satin and very richly decorated and furnished, a door opens into the saloon, in which a bay following the contour of a semicircular tower is modified into a semi-octagon with slanting angles. The white marble mantel-piece is supported by Roman slaves; the dado is of walnut and maple inlaid; the window shutters and doors are richly carved; the walls hung with damasked satin and enriched with a frieze between the cornice and architrave; and the ceiling is coffered and panelled, and the carved-work in each panel is gilded. Adjoining it is the drawing-room. Two female figures, copied from antique canephore, uphold the marble mantel-piece; and the dado and other woodwork, the ceilings and the walls, are treated with the same sumptuousness as those of the saloon. The utmost harmony of tone prevails. Beyond the drawing-room, in the adjoining tower, is the dining-room, which covers the site of the dining-hall built by Henry de Percy. The art of the Italian carver and his school of English and Scottish assistants, who were engaged for some years in perfecting this re-embellishment, is seen in this apartment to more advantage than in the others, as their work in the superb ceiling, the dado, doors and window-shutters, is left, uncoloured and ungilded, in the natural tints of the pine and cedar and walnut woods employed. The great marble mantel-piece is supported by a bacchante and fawn, and is sculptured with the arms of the fourth Duke and his Duchess.

Over and above these constructional enrichments, and the lustre of the marbles, and splendour of gold and colours, all these apartments are adorned with paintings by some of the most gifted of the old masters, by superb mirrors, gilded chairs and inlaid cabinets and tables, soft-piled carpets, and innumerable artistic elegances. The chapel is within easy access of them; and has been made noteworthy with the mosaic-work known as *Opus Alexandrum*. There are other apartments of similar Italian presentment that are admirable, one of which, especially a boudoir,

is treated with still more lavishment of costliness.

The kitchens, which adjoin the line of circumvallation, bring us back to old associations again. Opposite the huge open fire, which consumes a ton of coal at a time, hangs the great dish for the baron of beef, which, preceded by a ducal piper playing *Chevy Chase* on the Northumbrian pipes, is placed upon the banquet-table on grand occasions. Around are all the appliances modern ingenuity has been able to invent to further the most artistic preparation of food. The principal kitchen is about thirty-four feet square; and the walls, floor, and lantern-shaped roof are built of stone in the old mediæval manner. There is a great hydraulic roasting-jack; and steam is made to take several parts in the necessary operations. There is another kitchen where vegetables only are prepared; and there are also a pastry kitchen, larders for meat, fish, game, stock, and a plucking-room. Lifts are used to lessen labour. Below the kitchens are huge vaults for coals and lifts for them. Along the same side of the bailey are the numerous offices required for the conduct of the business of the estate; and near them is the four-faced clock tower.

The centuries; the number of sovereigns who have passed under the gateway and dismounted in the courtyard to partake of hospitality; the ancient Percies, and the times their warriors were brought home dead; the celebrities who visited it in the days of the first Duke and Duchess; as well as the reputations of the artists, scholars, and antiquaries engaged upon the most recent alterations and decorations, have combined to invest this northern lion with an interest that the passing of years can only enhance. Ever and anon great gatherings are held in it that in their turn impart fresh associations. Twenty-five years ago, when the present Earl Percy came of age, there was a week of rejoicing with fêtes and feasts; and now History has repeated itself with similar expressions of joy and gladness on the coming of age of his eldest son, Lord Warkworth.

THE IVORY GATE.*

By WALTER BESANT.

CHAPTER XIX.—THE PRODIGAL AT HOME.

IN the morning, Elsie rose at seven and put together such things as she would want for the three weeks before her marriage, if she was to spend that interval under her brother's care. At eight o'clock she received her letters—including one in a handwriting she did not know. She opened it. 'DEAR ELSIE,' it said, 'come to me at once. Come early. Come to breakfast at nine. I will wait for you till ten, or any time. —Your affectionate brother, ATHELSTAN.'

'Oh!' she murmured. 'And I did not know his writing. And to think that I am twenty-one, and he is thirty-one; and that I have never had a letter from him before!'

Her boxes were packed. She put on her jacket

* Copyright 1892 in the United States of America by Harper & Brothers.

and hat and descended into the breakfast-room, where her mother was already opening her letters and waiting breakfast.

'You are going out, Elsie?' she asked coldly.

'Yes. Hilda told you, I suppose, what she came here for yesterday. In fact, you sent me a message.'

'I hope she delivered it correctly.'

'She said that you would not sanction my wedding while this charge, or suspicion, was hanging over George's head. And that you would not see him until it was withdrawn or cleared away.'

'Certainly. In such a case it would be worse than hypocrisy to receive him with friendliness.'

'Then, like Hilda, you accept the conclusion.'

'I am unable to do anything else. The conclusion seems to me inevitable. If not, let him explain. I hope that no time will be lost in bringing the formal charge. It is foolish kindness—real cruelty—to all concerned to keep such a thing hanging over our heads. I say *our* heads, not yours only, Elsie, because you know your brother is implicated—perhaps the real contriver—of the dreadful scheme.'

'Would you believe me if I were to tell you that Athelstan *could* not be implicated?'

'My dear—believe you? Of course, I would believe if I could. Unfortunately, the evidence is too great.'

Elsie sighed. 'Very well; I will say nothing more. You have driven out my lover, as you drove out my brother for the self-same cause, and on the self-same charge. I follow my lover and my brother.'

'Elsie!'—her mother started. 'Do not, I pray you, do anything rash. Remember—a scandal—a whisper even—may be fatal to you hereafter. Sit down and wait. All I ask you to do is to wait.'

'No; I will not wait. If those two are under any cloud of suspicion, I too will sit under the cloud and wait until it lifts. I am going to stay with my brother until my wedding. That is to be on the 12th.'

'No—no—my poor child. There will be no wedding on the 12th.'

'Before that time, everything will be cleared up, and I shall be married from this house, so that I have left all my things, my presents—everything.'

Her mother shook her head.

'Try not to think so cruelly of George and of Athelstan, mother. You will be sorry afterwards. Try to believe that though a case may look strange, there may be a way out.'

'I have told you'—her mother was perfectly cold and unmoved—'that I have come to this conclusion on the evidence. If the young man can explain things, let him do so. There will be no wedding on the 12th—Elsie. You can come home as soon as you are convinced that your brother is an improper person for a young lady to live with, and as soon as you have learned the truth about the other young man. That is to say, I will receive you under these distressing circumstances, provided there has been no scandal connected with your name.'

Elsie turned and left the room. The fifth commandment enjoins that under such circum-

stances as these the least said the soonest mended.

When a man learns that his sister, his favourite sister, from whom he has been parted for eight years, the only member of his family who stood up for him when he was falsely accused of a disgraceful thing, is about to take breakfast with him, he naturally puts as much poetry into that usually simple meal as circumstances allow. Mostly Athelstan took a cup of coffee and a London egg. This morning he had flowers, raspberries lying in a bed of leaves, a few late strawberries, various kinds of confections in dainty dishes, toast and cake, with fish and cutlets—quite a little feast. And he had had the room cleared of the bundles of newspapers: the pipes and cigar cases and all the circumstances of tobacco were hidden away—all but the smell, which lingered. One thinks a good deal about a sister's visit, under such conditions. At a quarter past nine Elsie arrived. Athelstan hastened to open the door, and to receive her with open arms and kisses strange and sweet. Then, while the people of the house took in her luggage, he led his sister into the room, which was the front room on the ground-floor.

'Elsie!' he said, taking both her hands in his, 'eight years since we parted—and you are a tall young lady whom I left a little girl. To hold your hand—to kiss you, seems strange after so long.' He kissed her again on the forehead. She looked up at the tall handsome man with a kind of terror. It was almost like casting herself upon the care of a strange man.

'I remember your voice, Athelstan, but not your face. You have changed more than I, even.'

'And I remember your voice, Elsie—always a soft and winning voice, wasn't it?—to suit soft and winning ways. There never was any child more winning and affectionate than you—never.'

'Oh! you are grown very handsome, Athelstan. See what a splendid beard, and the brown velvet jacket, and white waistcoat—and the crimson tie. You look like an artist. I wish all men wore colours, as they used to do. I only heard yesterday that you were in London. Hilda told me.'

'Was that the reason why you cannot stay at home?'

'Part of the reason. But you shall have breakfast first. You can take me in without any trouble?'

'My dear child, I am more than delighted to have you here. There is a room at the back where you will be quiet: we have only this one room for sitting-room, and I think we shall find it best to go out every day to dinner. That will not hurt us, and George will come every evening. —Now, Elsie, you sit here, and I will— No—I quite forgot. You will pour out the tea. Yes—I see. I thought I was going to wait upon you altogether.—There—now you will make a good breakfast, and—and— Don't cry, dear child.'

'No—Athelstan.' She brushed away the tears. 'It is nothing. I shall be very happy with you. But why are you not at home? And why am I here? Oh! it is too cruel—too perverse of them!'

'We had better have it out before breakfast, there.—Strawberries don't go well with tears, do they? Nor jam with complainings. Come, Elsie, why need you leave home?'

'Because, in two words, they are treating George as they treated you. I was younger then, or I would have gone away with you.'

'Treating George? Oh! I understand. They are pouring suspicion upon him. Well, I saw that this was coming. Old Checkley, I swear, is at the bottom of this.'

'Yes—Checkley went to Sir Samuel with the "Case," as he called it, complete. He proved to their joint satisfaction that nobody could have done the thing except George, assisted by you.'

'Oh! assisted by me.'

'Yes—while you were in California, I suppose. There is to be a warrant for your arrest—yours and George's—in a few days, they say. Hilda brought the news to my mother. They both believe it, and they want me to break off my engagement. My mother refuses to see George so long as this charge, as she calls it, remains over him. So I came away.'

'You did wisely. Well—any one may call up a cloud of suspicion, and it is sometimes difficult to disperse such a cloud. Therefore, we must do everything we can to find out who is the real criminal.—Now, let us rest quite easy. There can be no arrest—or any charge—or anything but a fuss created by this old villain. It is only troublesome to find one's own people so ready to believe.'

'Why did you not tell me that you were home again?'

'Pour out the coffee, Elsie, and begin your breakfast. I wanted to reserve the Return of the Prodigal until you came home after your honeymoon. Then I meant to call mysteriously about sunset, before George was home. I thought I would have a long cloak wrapped about me. I should have begun: "Madam: you had once a brother."—"I had"—that is you.—"On his deathbed."—"My brother dead?"—that's you.—"With this packet."—Oh! we have lost a most beautiful little play. How can I forgive you?'

Then they went on with breakfast, talking and laughing until, before the meal was finished, they had lost their shyness and were brother and sister again.

After breakfast, Athelstan took a cigarette and an easy-chair. 'Now I am going to devote the whole day to you. I have nothing to do for my paper which cannot wait till to-morrow. All this morning we will talk—that is, until we are tired. We will have lunch somewhere, and go to see the pictures. George will come at about seven: we will have dinner, and go to the Naval Exhibition. Then we will get home, and have another talk. To-morrow, I shall have to leave you to your own devices between ten and six or so. I am very busy some days; on others, I can find time for anything.—Now that's all cleared up. I am to be your banker and everything.'

'Not my banker, Athelstan. Oh! you don't know. I am a great heiress.'

'Indeed? How is that?' he asked, a little twinkle in his eye.

'Mr Dering told me when I was twenty-one,

three weeks ago. Somebody has given me an immense sum of money—thirteen thousand pounds.'

'That is a very handsome sum. Who gave it to you?'

'That is a secret. Mr Dering refuses to tell me. I wish I knew.'

'I wouldn't wish if I were you. Gratitude is at all times a burden and a worry. Besides, he might be a vulgar person without aspirates or aspirations. Much better not inquire after him. Thirteen thousand pounds at three and a half per cent. means four hundred and fifty pounds a year. A nice little addition to your income. I congratulate you, Elsie; and this evening we will drink the health of the unassuming benefactor; the retiring and nameless recogniser of maidenly worth. Bless him!'

'And now, Athelstan, begin your adventures. Tell me everything: from the day you left us till now. You cannot tell me too much or talk too long. Before you begin, ask any questions about my mother and Hilda that you want to ask. Then we can go on undisturbed.'

'I have no questions to ask about either. I have already ascertained from George that both are in good health, and that Hilda has married a man with an immense fortune. That is happiness enough for her, I hope.—Now, Elsie, I shall be tedious, I am afraid; but you shall hear everything.'

He began. It was such a narrative as thousands of young Englishmen have been able to tell during the last five-and-twenty years. The story of the young man with a few pounds in his pocket, no friends, no recommendations, and no trade. Athelstan landed at New York in this condition. He looked about for employment and found none. He hastened out of the crowded city: he went West, and got work in the business open to every sharp and clever man—that of journalism. He worked for one paper after another, getting gradually more and more West, until he found himself in San Francisco, where he was taken on by a great paper, which had now sent him over here as its London correspondent. That was all the story; but there were so many episodes in it, so many adventures, so many men whom he remembered, so many anecdotes cropping up, in this eight years' history of a man with an eye, a brain, and a memory, that it was long past luncheon-time when Athelstan stopped and said that he must carry on the next chapter at another time.

'That pile of dollars that you made over the silver mine, Athelstan—what became of them?'

'What became of them? Well, you see, Elsie, in some parts of the United States money vanishes as fast as it is made. All these dollars dropped into a deep hole of the earth, and were hopelessly lost.'

She laughed. 'You will tell me some day—when you please—how you lost that fortune. Oh! what a thing it is to be a man and to have all these adventures!—Now, Athelstan, consider—if it had not been for your bad fortune, you would never have had all this good fortune.'

'True. Yet the bad fortune came in such an ugly shape. There has been a black side to my history. How was I to tell people why I left

my own country? I could make no friends. At the first appearance of friendship, I had to become cold, lest they should ask me where I came from and why I left home.'

Elsie was silent.

They carried out part of their programme. They went to see the pictures—it was eight years since Athelstan had seen a picture—and after the pictures they walked in the Park. Then they went home and waited for George, who presently appeared. Then they went to one of the Regent Street restaurants and made a little feast. After this, Elsie asked them to come home and spend a quiet evening talking about things.

By common consent they avoided one topic. Edmund Gray was not so much as mentioned, nor was the malignity of Checkley alluded to. They talked of old days, when Athelstan was a big boy and George a little boy and Elsie a child. They talked of the long engagement, and the hopeless time, when it seemed as if they were going to marry on two hundred pounds a year: and of that day of miracle and marvel when Mr Dering gave to one of them a fortune, and to the other a partnership. They talked of their honeymoon and the tour they were going to make, and the beautiful places they would see. Tours and Blois, Chenonceaux and Amboise; Angoulême and Poitiers and La Rochelle; and of their return, and the lovely flat, where the friends would be made so welcome. Athelstan was a person of some sympathy. Elsie talked as freely to him as she could to George. They talked till midnight.

Then Elsie got up. 'Whatever happens, Athelstan,' she said, 'mind—whatever happens, you shall give me away on the 12th.'

'Now she has left us,' said George, 'you may tell me why she refused to stay at home.'

'Well—I suppose you ought to know. Much for the same reason that I refused to stay at home. They then chose to jump at the conclusion that at one step I had become from a man of honour, a stupid and clumsy forger. They now choose—I am ashamed to say—my mother and sister choose—to believe that you and I together have devised and invented this elaborate scheme of forgery. With this end in view, it has been found necessary to contrive certain little fabrications—as that I have been living in London on my wits—that is to say, by the exercise of cheater—y—for the last eight years; and that, being in rags and penniless, I persuaded you to join me in this neat little buccaneering job.'

'Oh! it is too absurd! But I suspected something. Well—it is perfectly easy to put a stop to that.'

'Yes, it is easy. At the same time, it will be well to put a stop to it as soon as possible, before the thing assumes serious proportions, and becomes a horrid thing, that may stick to you all your life. You have got to do with a malignant man—perhaps a desperate man. He will spread abroad the suspicion as diligently as he can. Let us work, therefore.'

'Well—but what can we do, that we have not done? How can we fix the thing upon Checkley?'

'I don't know. We must think—we must find out something, somehow. Let us all three

work together. Elsie will make the best detective in the world. And let us work in secret. I am very glad—very glad indeed—that Elsie came.'

DETECTION OF CRIME BY PHOTOGRAPHY.

BY T. C. HEPWORTH.

THE detection of crime is a matter of fascinating interest to all but those who, unhappily for themselves, have to pay the penalty of wrong-doing. The novelist as well as the dramatist knows well that a crime round which a mystery hangs, or which involves the detection or pursuit of a suspected individual, is a theme which will at once secure the attention of those for whom he caters. In one respect it is a misfortune that this should be so, for there has arisen a copious supply of gutter literature, which, by its stories of wonderful escapes, and lawless doings of notorious thieves and other vagabonds, arouses the emulation of youthful readers, and often, as the records of our police courts too frequently prove, tempts them to go and do likewise. On the other hand, we cannot look without admiration at such a wonderful word-picture as that given us in *Oliver Twist*, where the wretched Sikes wanders with the brand of Cain upon him, haunted by the visionary form of his victim.

Both novelists and playwrights have many clever ways of tracking their puppets and hounding them to death. Some of these are hackneyed enough, such as the footmark in the soil, the dirty thumb-mark on the paper, &c.; and he who can conceive a new way of bringing about the inevitable detection is surely half-way towards success.

Once, again, has romance been beaten by reality. In this matter of the detection of criminals the Photographic Camera has lately performed such novel feats, that quite a fresh set of ideas is placed at the disposal of fiction-mongers. The subject recently came before the Photographic Society of Great Britain in the form of a paper by Dr Paul Jeserich of Berlin, a chemist, who has devoted his attention for many years to the detection of crime by scientific means, and more especially by means of photography. This paper was illustrated by a remarkable collection of photographs, which were projected by means of an optical lantern. Some of the wonderful results obtained by this indefatigable worker we will now briefly place before our readers.

Most persons are aware that for many years it has been the practice in this and other countries to take the portraits of criminals when they become the unwilling tenants of the State, and such photographs have proved most useful in subsequent identification. There is little doubt, thinks Dr Jeserich, that this system might with advantage be extended to the photographing of

the scene of a crime, for the camera will faithfully record little details, at the time considered to be unimportant, but which may supply a valuable link in the chain of evidence later on. Thus, he refers to a case of murder, when, in the course of a terrible struggle, the contents of a room were upturned, a clock, among other things, being hurled from its place and stopped. A photograph would have shown the hour at which the deed was done, a fact of first importance, as every prisoner who has endeavoured to establish an alibi knows well enough. But it is in microscopical examination, and in the subsequent photographing of the object examined in much magnified form, that Dr Jeserich has done his most noteworthy work. Such a photograph will often afford evidence of the most positive kind, which can be readily comprehended and duly appraised by judge and jury alike. Let us now see, by a few examples, how the method works out.

The first criminal case brought forward by Dr Jeserich was one in which the liberty of a suspected man literally 'hung upon a hair,' for by a single hair was he tracked. The case was one of assault, and two men were suspected of the deed. A single hair was found on the clothing of the victim, and this hair was duly pictured in the form of a photo-micrograph. (It may be as well, perhaps, to point out here that by this term is meant the enlarged image of a microscopic object, the term micro-photograph being applied to those tiny specks of pictures which can only be seen when magnified in a microscope.) A, one of the suspected men, had a gray beard, and a hair from his chin was photographed and compared with the first picture taken. The difference in structure, tint, and general appearance was so marked that the man was at once liberated. The hair of the other man, B, was also examined, and bore little resemblance to that found on the victim. This latter was now more carefully scrutinised, and compared with other specimens. The photograph clearly showed for one thing that the hair was pointed; it had never been cut. Gradually the conclusion was arrived at that it belonged to a dog, 'an old yellow, smooth-haired, and comparatively short-haired dog.' Further inquiry revealed the fact that B owned such a dog, a fresh hair from which agreed in every detail with the original photograph; and the man was convicted. He subsequently confessed that he alone had committed the crime.

In the identification of blood stains, several difficulties crop up. As every one knows, blood when magnified is found to contain myriads of little globules, or corpuscles as they are commonly called. Some of these are colourless; but the others are red, and give to blood its well-known colour. The microscopist can tell whether the blood which he submits to examination is that of a mammal, of a bird, or of a fish, for the corpuscles of each have distinct characteristics. But when we ask him to differentiate between the blood-corpuscles of different kinds of mammals, he is somewhat at a loss, because his only guide is that of size. Thus, the blood-corpuscles of the elephant are, as might be expected, larger than those of any of the other

mammalia. But they are in other respects like those of his brother in mammal Man: round in outline, and looking like so many coins carelessly thrown together. A dog or a pig possesses corpuscles of smaller size, while those of the goat are very much smaller still. Here is a case in which these differences witnessed with terrible effect against a man suspected of a serious crime. A murder had been committed, and D was the man suspected; suspicion being strengthened by the circumstance that an axe belonging to him was found smeared with blood, which had been partly wiped off. The man denied his guilt, and accounted for the blood-stained weapon, which he declared he had not taken the trouble to wipe, by saying that he had that day killed a goat with it. The blood was examined microscopically, and the size of the corpuscles proved his statement to be false. A photo-micrograph of it, as well as one of goat's blood, was prepared for comparison by the judge and jury. Another photo-micrograph was also made from part of the blade of the axe, which showed very clearly by unmistakable streaks that the murderer had done his best to remove the traces of his crime. It is certain that these photographs must be far more useful for purposes of detection than the original microscopic preparations from which they are taken, for it requires a certain education of the eye to see through a microscope properly, and still more to estimate the value of the evidence it offers. It is certain, too, that counsel on either side would see through the microscope with very different eyes.

We now come to a very important section of Dr Jeserich's work, the detection of falsification of handwriting and figures by means of photography. Crimes of this nature are far more common than deeds of violence, and, judging by the heavy punishment meted out to the offenders in comparison with the mild sentences often passed upon men whom to call brutes would be base flattery, the law would seem to consider such sins worse than those committed against the person. However this may be, it is a most important thing that this very dangerous class of crime should be subject to ready detection. The microscope alone will not help us much, although we can detect by its aid places in paper where erasures have been made. If any one will take the trouble to examine microscopically the paper on which these words are printed, using quite a low-power object glass, he will note that its smooth surface altogether disappears, and that it seems to be as coarse as blanket. This being the case, it will be readily understood that an erasure with a knife which would be imperceptible to the unaided eye becomes so exaggerated when viewed with the microscope that there can be no mistake about it. In examining writing by this searching aid to vision, the finest lines appear thick and coarse. It is also possible to ascertain whether an alteration has been made in a word before the ink first applied has become dry, or whether the amendment has been an after-thought. In the former case the previously applied ink will more or less amalgamate with and run into the other, as will be clearly seen under the microscope; while in the latter case, each ink-mark will preserve its own unbroken outline. The use of this observation in cases of

suspected wrong-doing is obvious. Dr Jeserich shows two photographs which illustrate these differences. In the first, a document dated early in January is marked 1884—the 4 having been altered into a 5 as soon as written—so as to correct a mistake which most of us make a dozen times or more at the beginning of each new year. In the other picture the date had been altered fraudulently and long after the original words had been traced, in order to gain some unworthy advantage.

The photographic plates by which these records have been accomplished are the ordinary gelatine plates which are being used in the present day by thousands of amateur workers. By special preparation, these plates can be made to afford evidence of a far more wonderful kind, and can in certain cases be made to yield a clear image of writing which has been completely covered with fresh characters by the hand of the forger. In this way the true and the false are distinctly revealed together with the peculiarities belonging to each clearly defined.

The word 'ordinary' has special significance to photographers, and is used by them in contradistinction to a colour-sensitive (orthochromatic) plate. This second kind of sensitive surface is of comparatively recent date, and the great advantage in its use is that it renders colours in their relative shade-values to one another. An 'ordinary' plate will photograph blue as white, and yellow and red as black. But a colour-sensitive plate will render these colours more according to their relative brightness; just, in fact, as an engraver would express them by different depths of 'tint.' These plates are especially useful in photographing coloured objects, such as paintings in oil or water-colour. Dr Jeserich has, however, pointed out an entirely new use for them, and has shown that they will differentiate between black inks of different composition.

The oft-quoted line, 'Things are not always as they seem,' is very true of what we call black ink. It is generally not black, although it assumes that appearance on paper. Taking, for experiment, the black inks made by three different manufacturers, and dropping a little of each into a test-tube half full of water, the writer found that one was distinctly blue, another red, and the third brown. Each was an excellent writing fluid, and looked as black as night when applied to paper. Now, Dr Jeserich prepares his colour-sensitive plates in such a way that they will reveal a difference in tone between inks of this description, while an ordinary plate is powerless to do anything of the kind. Among other examples, he shows the photograph of a certain bill of exchange whereon the date for payment is written April. The drawer of this bill had declared that it was not payable until May; whereupon Dr Jeserich photographed it a second time with a colour-sensitive plate. The new photograph gives a revelation of the true state of affairs. The word 'Mai' has been altered to April by a little clever manipulation of the pen, and the fraud was not evident to the eye, to the microscope, or to the ordinary photographic process. But the colour-sensitive film tells us that the ink with which the original word 'Mai' was written was of a different black hue from that employed by the forger when he wrote over it

and partly formed out of it the word 'April.' The consequence is that one word is much fainter than the other, each stroke of alteration being plainly discernible, and detecting the forgery. Another case is presented where a bill already paid, let us say, in favour of one Schmidt, is again presented with the signature Fabian. Here, again, the photographic evidence shows in the most conclusive manner that the first word is still readable under the altered conditions. In this case, when the accused was told that by scientific treatment the first name had been thus revealed, he confessed to the fraud, and was duly punished.

Alterations in figures have naturally come under Jeserich's observation, figures being, as a rule, far more easy to tamper with than words, especially where careless writers of cheques leave blank spaces in front of numerals to tempt the skill of those whose ways are crooked. Dr Jeserich shows a document which is drawn apparently for a sum of money represented by the figures 20,200. The amount was disputed by the payer, and hence the document was submitted to the photographic test. As a result it was found that the original figures had been 1,200—and that the payee had altered the first figure to 0, and had placed a 2 in front of it. The result to him was four years' penal servitude; and it is satisfactory to note that after sentence had been passed upon him, he confessed that the photograph had revealed the truth.

Two cases in which fabrication of documents was rendered evident by the camera are of a somewhat amusing nature, although one might think it difficult to find matter for mirth out of these mendacious doings. Two citizens of Berlin had been summoned for non-payment of taxes, and had quite forgotten the day upon which the summonses were returnable, thus rendering themselves liable to increased expenses. It was a comparatively easy matter, and one which evidently did not lie very heavily on their consciences, to alter the 24 which denoted the day of the month into 26. But that terrible photographic plate found them out, and the small fine which they hoped to evade was superseded in favour of imprisonment for the grave offence of falsifying an official document. In another case a receipt for debts contracted up to 1881 was altered to 1884 by the simple addition of two strokes in an ink which was of a different photographic value from the ink which had been used by the author of the document.

Many cases like these, relating to falsification of wills, postal orders, permits, and other documents, have come under the official notice of Dr Jeserich. One of these is especially noteworthy because the accused was made to give evidence against himself in a novel manner. He was a cattle-dealer, and had altered a permit for passing animals across the Austrian frontier at a time when the prevalence of disease necessitated a certain period for quarantine. The photographic evidence showed that a 3 had been added to the original figures, and it was necessary to ascertain whether the prisoner had inserted this numeral. To do this he was made to write several 3's, and these were photographed on a film of gelatine. This transparent film was now placed over the impounded document, and it was found that any

of the images of the newly-written figures would very nicely fit over the disputed 3 on the paper. Such a test as this, it is obvious, is far more conclusive and satisfactory in every way than the somewhat doubtful testimony of experts in handwriting, the actual value of whose evidence was so clearly set forth during the celebrated Parnell inquiry.

It is refreshing to turn to an instance in which the photographic evidence had the effect, not of convicting a person, but of clearing him from suspicion. The dead body of a man was found near the outskirts of a wood, and appearances indicated that he had been the victim of foul-play. An acquaintance of his had been arrested on suspicion; and a vulcanite match-box believed to belong to the accused—an assertion which, however he denied—seemed to strengthen the case against him. The box was then subjected to careful examination. It was certainly the worse for wear, for its lid was covered with innumerable scratches. Amid these markings it was thought that there were traces of a name, but what that name was it was quite impossible to guess. Dr Jeserich now took the matter in hand, and rubbed the box with a fine impalpable powder, which insinuated itself into every crevice. He next photographed the box while a strong side-light was thrown upon its surface so as to show up every depression, when the name of its owner stood plainly revealed. This was not that of the prisoner, but belonged to a man who had dropped the box near the spot where it was found many weeks before the suspected crime had been committed. The accused was at once released.

In conclusion, we may quote one more case of identification which, although it does not depend upon the camera, is full of interest, and is associated with that other wonderful instrument known as the spectroscope. Solutions of log-wood, carmine, and blood have to the eye exactly the same appearance; but when the liquids are examined by the spectroscope, absorption bands are shown which have for each liquid a characteristic form. In the case of blood the character of the absorption bands alters if the liquid be associated with certain gases, such as those which are given off during the combustion of carbonaceous material. Now, let us see how this knowledge was applied in a case which came under Dr Jeserich's official scrutiny. A cottage was burned down, and the body of its owner was found in the ruins in such a charred condition that he was hardly recognisable. A relative was, in consequence of certain incriminating circumstances, suspected of having murdered the man, and then set fire to the building in order to hide every trace of his crime, thinking, no doubt, that the conflagration would be ascribed to accident. The dead body was removed, and a drop or two of blood was taken from the lungs and examined spectroscopically, with a view to finding out whether death had been caused by suffocation or had taken place, as was believed, before the house was set on fire. The absorption spectrum was found to be that of normal blood, and the suspicion against the accused was thus strengthened. He ultimately confessed to having first committed the murder, and then set fire to the building, according to the theory adopted by

the prosecution. The proverb tells us that 'the way of transgressors is hard.' The thanks of the law abiding are due to Dr Jeserich for making it harder still.

MAJOR RANDALL'S WARNING.

PART III.—CONCLUSION.

MAJOR RANDALL only remained a few days at the Hall, having a large circle of friends to visit before returning to his military duties in India. There was to be a week's hunting at one place, a week's shooting at another; then a stay with former brother-officers at Woolwich and Aldershot, lastly, to his married sister in Worcestershire. Sir Philip and Lady Hartbury were rich, spending their money freely, as wealthy people ought to do. They entertained largely. A country seat with a succession of staying guests is charming; at least the Major found it so after his long sojourn in the East, and for the time he quite gave himself up to the enjoyment of English home-life and society. He was a general favourite, being bright, agreeable, fine-looking, and an amusing *raconteur* of Indian adventures; unmarried, on the verge of forty. Now forty is really an excellent age in a man; for he is experienced, as clever perhaps as he will ever be; the glamour of youth with its rose-tinted atmosphere has departed, and he sees his fellow-men with plain black and white outlines, yet is still young enough to enjoy life. Such was Major Randall.

There were few ladies who would have refused him had he made proposals of marriage; but he was not a marrying man; an early disappointment—through death—had caused him to relinquish that idea for ever.

There were frequent dinner-parties at the Hall, and occasional dances; the time passed swiftly and pleasantly. Several times he attempted to take his departure, but had been induced to stay on by his sister and brother-in-law's solicitations. At last he terminated his visit in a very unexpected manner. One night, after a musical evening, or home concert, in which the Major had distinguished himself—for he had a pleasant barytone voice, and sang ballads nicely—he retired to rest about eleven o'clock, in a happy enough state of mind, such as people feel who have done their best and been appreciated. He went to sleep at once, and slept for two hours, when he awoke with a start: some one was speaking to him. Raising himself upon his elbow, he gazed round the room, dimly visible by a tiny night-light. There was no one there, and nothing disturbed. Yet a voice had said distinctly: 'Go to Lincoln.'

Had he dreamt it? If so, why dream of Lincoln, where he knew no one? Composing himself to sleep again for about another two hours, once more he was suddenly awakened with a greater shock, for again the voice repeated closer to him and most impressively: 'Go to Lincoln.' This time the Major got up and thoroughly searched the room. He had locked the door, so no one could enter that way. The house was hushed in profound repose, not a sound, save the dull ticking of a clock at the end of the corridor.

Major Randall was extremely discomposed. He was not a superstitious man by any means; but there was a tone in that voice that penetrated to his very soul with a thrill through his system such as he had never before experienced.

'Dreams are strange things,' he said to himself; 'why should I dream of Lincoln, where I have not been half-a-dozen times in my life, and that twenty years ago?'

Again he got into bed, but not to sleep, for his nerves were too much excited. He tried to lose himself in vain; his mind was so thoroughly awake and clear, that—as he afterwards declared—he could have written any letters or despatches as well as ever he did in his life.
